The lower city, of which this second settlement on the hill was the acropolis, extended far out on the level plateau, on the southwest, south, and southeast of Hissarlik. Here must have been the real Troy, "with broad streets"; here were the outer walls with the Scæan Gate; here was the tower of Troy, from which Helen descried the Grecian heroes. The discovery of the undoubted existence of this lower city is one of the most important results of the excavations of 1882. Dr. Schliemann was not satisfied with the negative results of his investigation by shafts in 1873; and, therefore, in 1882 he undertook a systematic exploration of the plateau on the east, south, and west of the acropolis. He now dug three trenches, one about 200 feet, one about 130 feet, and one about 360 feet in length. In the first of these he dug to the depth of nearly forty feet before coming to the solid rock; and he found "very large quantities of Hellenic pottery, and, in the lowest layers, masses of fragments of those kinds of very ancient pottery which are peculiar to the two most ancient cities of Hissarlik" (p. 25). The second trench was dug where it was thought that the wall of the lower city must have stood. "In fact," Dr. Schliemann says, "I found there, at the exact spot where it must be supposed to have existed, the rock artificially levelled; so that there can can be no doubt that the wall once stood here; but not a stone of it remained *in situ*" (p. 26). In the third trench he struck the rock at a depth of from 6½ to 20 feet, and found Hellenic house-walls and Hellenic pottery, "but in the lowest layers of débris again a very large quantity of prehistoric terracottas of the first two cities of Hissarlik" (p. 26). He also sank a large number of shafts at various points around the citadel. The result is that there remains no doubt of the existence of a large lower city, which appears by its pottery to be of the same age with the two earliest settlements on the hill. It was of course impossible to make as thorough an exploration of the large plateau as was made of the acropolis, and we can hardly expect a more accurate report than this, unsatisfactory though it is, upon this most interesting and important question, with which we feel that the identification of the "Burnt City" with Troy is essentially connected. Dr. Dörpfeld says of the lower city, that its limits cannot be determined with certainty, but that its existence is established most decisively ("aufs bestimmteste"). The dotted line which marks its extent on Plan VIII. of 'Troja' is therefore in many respects conjectural, being determined in great part by the formation of the ground and by the presence of the more ancient pottery ('Troja,' p. 63).

These two results of the last year's work—first, the discovery that Hissarlik was only the acropolis of the second city, and that the greater part of the hill, at the time of that city's destruction, was occupied by only a few large buildings, apparently temples and dwelling-houses; and, secondly, the discovery of a large lower city of the same age, with which the acropolis was connected by at least three gateways—seem to us to strengthen Dr. Schliemann's original position in two most essential points, and to remove all reasonable doubt that he has discovered the city of Troy which was the historic basis of the myth of Troy. In accepting the same conclusion three years ago we did not accept the facts as they were reported, but based our judgment on a view of the facts which has now proved to be the correct one. If the walls and foundations of buildings now to be seen on Hissarlik had been exposed to view during the last hundred years, as the walls and Lion Gate of Mycenæ have been, it would hardly have occurred to any one to doubt that we had here the Homeric Troy in the same sense in which we had the Homeric Mycenæ. Troy and Mycenæ are both mythical cities—that is, the details of their histories are so mixed with fable and so embellished by the fancy of many generations of poets, that it is now generally impossible to separate the true from the false; but it is more reasonable to believe that the fables and poetic fancies clustered around real cities which had been famous in their day and generation than around purely imaginary creations of the poet's brain. And this presumption becomes all the stronger when we find important ruins which can naturally be assigned to the cities in question.

The new excavations have also made it more evident that the great prehistoric city of which we have been speaking passed through a mighty conflagration. No one can see the mass of burnt bricks upon which the third town was built, with the cracked pavements and the wood reduced to charcoal, and, above all, the gold and silver ornaments and articles of bronze found in the ruins, without being convinced that a terrible fire once swept over that fated hill. Dr.

Schliemann writes that these marks of heat are most striking on the bronze weapons. "Thus, for example, of the weapons found in the largest gold treasure, one bronze dagger has been completely curled up in the conflagration; a mass of lance-heads, daggers, and battle-axes have been fused together by the intense heat; there are, further, lance-heads fused to battle-axes, and a lance and battle-axe firmly fused to a copper caldron" (p. 58: with references to illustrations 800, 805, 807, 813, 815, of 'Ilios'). Here, however, a word of caution is needful, to modify much that has been said of the effects of this great fire. Not all the burnt bricks on Hissarlik, nor all the brick walls now standing with their surfaces glazed by the action of fire, are relics of burning Troy. The visitor, too, sees glazed walls which must be later than the fire which destroyed the great city. It now appears that the earlier settlers on Hissarlik built walls of crude unbaked bricks, and then baked them *in situ* by huge fires on both sides at once. The baking was often very imperfect, affecting only the outside surfaces, and chiefly those of the lower layers of bricks; but for more important buildings, like the two temples above mentioned, a more elaborate system was devised. In the larger temple there is in each fourth course of bricks a longitudinal groove from 10 to 14 inches deep and from 6 to 10 inches high, and at intervals of about 13 feet there are cross holes running directly through the wall; through these the fire permeated the wall more effectually. The arrangement of these grooves and holes may be seen from the illustrations on pp. 77 and 80. Dr. Schliemann supposes them to have been filled with wooden beams after the walls were baked.

It may perhaps be thought that this custom will account for all the marks of fire in the Burnt City, and thus make the great conflagration at least doubtful. But, though there may often be confusion on this point, there is no difficulty in distinguishing the two kinds of burning in the most important cases. No theory except that of a terrible fire will account for the state of the articles of gold, silver, and bronze above mentioned. No other will account for the charred deposits still remaining in many of the jars which are now standing in their places. In one of these we noticed a black substance with a level surface covered with apparent bubbles, looking as if it had been boiled and hardened. One of the most impressive sights at Hissarlik is the present appearance of the long, narrow passage-way, shown in fig. 18, p. 71 of 'Troja.' This must have been, at least in great part, a covered way leading into the heart of the acropolis from the great southern gate. It entered the hill at a level of about twelve feet below that of the second city, and it has been traced to near the middle of the acropolis, gradually ascending after it leaves the gateway. In the lower part of this way rows of wooden posts were once set on both sides at intervals of seven or eight feet, supporting some structure above. Each one has left a distinct impression of itself in the clay covering of the wall of the passage against which it leaned. These posts have disappeared, each leaving a heap of charcoal on the ground where it stood; and the clay in which they have left their impressions has been fused by the heat of their combustion. Those little piles of charcoal make the burning of Troy more real than volumes of argument.

Of course, nothing now remains above ground to show the nature or the extent of the destruction of the lower city on the plateau; but there can be no doubt that it shared the fate of the upper city. Strabo (p. 599) says that, as Troy was destroyed from its foundations, while the neighboring towns were only sacked and not entirely ruined, the stones of Troy were all carried away to rebuild the others. He adds that Archæanax of Mitylene walled Sigeum with stones from Troy. It is certain that the lower city was never rebuilt or fortified from the time of its capture by the Greeks until the time of Lysimachus, early in the third century B. C.; and even after that time the accounts of its condition are conflicting, and it long remained a place of little importance. It is thus literally true that, in the time of Æschylus and in that of the orator Lycurgus (330 B. C.), the site of Troy, *i. e.*, the real city of Troy on the plateau, had been for centuries an uninhabited waste, as it is described by these authors. The unimportant fact that small settlements had been made on the hill of the acropolis in the meantime was not likely to be known to the Athenian poet and orator, or to concern them if it was. This seems to be the simplest means of settling the vexed question about the references of Æschylus and Lycurgus to the deserted condition of Troy, without supposing that either had any belief that ancient Troy stood on any other site than that of the Greek Ilion, or, indeed, any theory about its site at all except the common idea that it was still uninhabited. The denial of the inhabitants of the Greek Ilion that the site had ever been entirely deserted or that the ancient city had ever wholly disappeared (Strabo, p. 600) is easily explained as referring to the little settlements on the acropolis, which were of more account to them than to the rest of the world. It will be noticed that Herodotus, in describing the visit of Xerxes to the temple of the Ilian Athena in 480 B. C., says merely: "He went up to the Pergamos of Priam, having a desire to see it, and when he had seen it and inquired about everything there, he sacrificed a thousand cattle to the Ilion Athena" (Herodotus, vii. 43). This shows that it was only a small place on the hill which Xerxes visited; it is not even called Ilion or spoken of as a town by the historian.

We have no space to discuss any of the other arguments for or against the identity of Hissarlik with the site of Homer's Troy. We merely remark that a passage of Plato ('Leg.,' p. 682 B.), which is often quoted in the discussion, is particularly applicable to the position of Hissarlik in the plain of Troy: "We say that the site of Ilion was changed from the heights, and it was settled in a great and beautiful plain, *on a hill which is not high* and has many rivers descending from the heights of Ida." The arguments in favor of this as the site of Troy are excellently stated by Grote ('Hist of Greece,' I. ch. xv.), who of course wrote in ignorance of any prehistoric ruins there: to his arguments must now be added all the strength which is gained from Dr. Schliemann's discoveries. We cannot doubt that every one who now visits the land of Troy will feel that, while there are a few allusions in the Iliad which it is hard to reconcile with the site of Hissarlik, this difficulty is not to be compared with the absolute impossibility of reconciling a far greater number with Bunarbashi, or with Strabo's impossible site of Troy at the "village of the Ilians." Dr. Dörpfeld gives the result of his five months' experience at Hissarlik in 1882 as follows (*Allgem. Zeit.*, Sept. 29, 1882): "For us architects who have concerned ourselves uninterruptedly with these questions for several months, it is settled beyond all doubt that the second city from the bottom, with its Pergamos and its stately buildings, which was completely destroyed by the hand of an enemy, and was restored in its ancient extent only by the Macedonians and the Romans, was the sacred Ilios of Homer, the city of Priam, which was captured and destroyed by the Greeks."

RECENT NOVELS.

To Leeward. By F. Marion Crawford. Boston: Houghton, Mifflin & Co.

An April Day. By Phillipa Prittie Jephson. Harper's Franklin Square Library.

A Great Heiress. By R. C. Francillon. Harper's Franklin Square Library.

The Canon's Ward. By James Payn. Harper's Franklin Square Library.

Thirlby Hall. By W. E. Norris. Harper's Franklin Square Library.

The Millionaire. Harper's Franklin Square Library.

A Hero's Last Days. By the author of 'A Sequence of Songs.' Columbia, S. C.: W. J. Duffie.

Our Christmas in a Palace. By Edward Everett Hale. Funk & Wagnalls.

An Ambitious Woman. By Edgar Fawcett. Boston: Houghton, Mifflin & Co.

Beatrix Randolph. By Julian Hawthorne. Boston: James R. Osgood & Co.

A Latter-Day Saint. Being the Story of the Conversion of Ethel Jones, related by Herself. [American Novel Series, No. 1.] Henry Holt & Co.

One False, Both Fair; or, a Hard Knot. By John B. Harwood. Harper & Brothers.

Diane Coryval. [No Name Series.] Boston: Roberts Brothers.

Old Mark Langston. A Tale of Duke's Creek. By Richard Malcolm Johnston. Harper & Brothers.

La Comtesse Sarah. Par Georges Ohnet. Paris: Ollendorf; New York: F. W. Christern.

THE tale Mr. Crawford has invented in 'To Leeward' to illustrate the dangers of drifting has been praised because "not immoral." By just so much as it is not immoral, it is not artistic, it is not true to life. The story of the seduction of a young wife scarcely out of the honeymoon, and of her death at the hands of her husband driven mad by her desertion, cannot be adequately told in a novel except in terms which, let us be thankful, our inherited instincts will not tolerate. A consciousness of the restriction should have forced the choice of a different subject, but Mr. Crawford has insisted upon his work in spite of it. We are spared scenes of exciting passion, but the effect is, that we never see in what lay the power of fascination, and therefore cannot believe in it. The story is cold and hard. The woman is silly; the man is a brute. If great genius could master such situations, it is beyond the power of the story-teller pure and simple such as Mr. Crawford. It is also said that there is a high moral lesson in the book because the punishment is so swift to follow the crime. A life in misery might be punishment, but death is not, unless future retribution is certain. Moreover, the wife's death is not made the death of a criminal. It is set in a sort of halo, for the spring to save her lover was the one unselfish act of her life. As to the man, so far as moral lesson goes, compare him with young Donnithorne in 'Adam Bede.' The book is more carefully, more solidly written than either of its predecessors. The author takes himself and his readers more seriously, but he has much yet to learn, for he is still capable of such a *bêtise* as, after telling in the person of a leading character, a pathetic little story and telling it well, then to add a foot-note: "The author witnessed the facts here described in 1880."

A good word can be said for four out of the five Franklin Squares on our list. As might be expected, Mr. Norris's work is the most substan-

tial. At the other end of the scale is 'An April Day,' which has but a feather's weight, yet is a pretty story—a little idyl, set, so to speak, to the old air of "Kathleen Mavourneen." The two fathers are the original figures in it, as unlike the conventional type as possible. 'A Great Heiress' comes to her own in disguise, and marks out the good and the bad, and rewards them accordingly in the summary way that is now somewhat old-fashioned. It would be a very fresh novel-reader who did not see through such a plot at once in these days. If the author has not succeeded in keeping his secret, he has made the most of his situation. Three-quarters of the book is so well done that it seems as if he might have contrived a conclusion without the intervention of a crime so shocking as the mill agent's. 'The Canon's Ward' is interesting, but it lacks harmony between the incidents and their surroundings. The characters fit well enough in the placid atmosphere of scholarly life. Elderly men and women with soft faces and voices, and, about them, ingenuous youth, all, old and young, devoted to one opening rose, make another of those gracious pictures by which English life has become so pleasantly familiar. Such a setting should belong to a very different plot. Sorrow comes surely even to such tranquil homes, but so strong is the feeling it could only come gently, that it is like a blow to meet a secret marriage at the beginning. The husband is at once drowned, and the secret is known to but one man, who uses it to force the Canon's ward to marry him. This leaves the story without a hero in the ordinary sense, for after such an outrage the reader can only detest him. The Canon is a suggestion of the dear old Warden, and he bears his reverses quite as patiently. But therein appears the superiority of the master-hand. The Warden is left in his patience, but the Canon's fortune is restored by one of the staple devices of the novel-writer.

Mr. Norris has chosen to try his hand, in 'Thirlby Hall,' upon a very old combination. A boy in love with the companion of his childhood, a young man fascinated by a finished woman of the world—the two phases in the same life have been often enough portrayed; but, from the very nature of the case, there always has seemed an injustice to somebody. We do not mean in the final decision, though it may be true enough there too, but in the characters assigned to the several heroines. The innocence of the girls becomes inanity, or the women, if nothing worse, are hard and chilling in their worldliness. Mr. Norris shows in Lady Constance Milner the selfishness which must be the ruling power in such a nature, but there is a candor about her, even in her judgment of herself, which saves something of respect for her. The book is less striking than some of the earlier ones; it is more direct in plot, and more even in execution. The characters are always well in hand, and there is not that division of interest, by running two or three parallel threads, which Mr. Norris has heretofore preferred.

'The Millionaire' appears to be an English tale, in which an omnipotent New York speculator plays the part that used to be given to the Indian uncle, and is the good genius of everybody. By way of balance to this most modern figure, we have one of the very old, the last of the strolling players. There is also an American lady, beautiful of course, and most amiable; but we fear that, before such flattering American portraits are accepted in England, they must be put into a story less patently imitated from Trollope, by an imagination not so commonplace and not so fond of cheap effects.

'A Hero's Last Days' is classed as fiction on the slightest grounds, for there is hardly a thread of a story. The writer has chosen the form only as a convenience for the record of the views of an honored friend upon social and political questions. Thrown into conversations between an old man and a young one, they show in an interesting way the point of view of two generations in South Carolina in those early days of the reconstruction known as the dark time. With so personal a motive, perhaps this was all that could be done, but the field is wider than the writer knew. South Carolina, with its marked distinctions between country and coast, with its unbroken traditions of England and of Huguenot France, offers to the novelist an opportunity only less fortunate than that which Cable has found in Louisiana.

'Our Christmas in a Palace' is a reprint of a dozen or more stories from magazines and newspapers. When Mr. Hale's stories are good they are very good, and it ought not to be surprising if not every one of these is up to his highest mark. We find more entertaining the little narrative in which they are interspersed. A party of people are snow-bound, a day's journey west of Council Bluffs, and beguile the time with story-telling—story-reading we should say, for Mr. Hale most ingeniously contrives that the right *Harper*, etc., shall be in somebody's basket or pocket: his conscience will not let the reader lose sight of the fact that they are reprinted. It is a pity he could not have made story-tellers, for surely our people have not lost the art.

No one who began 'An Ambitious Woman' as a serial could have failed to finish it, though it was difficult to form a judgment about it. In the present shape its merits lose nothing in themselves, but it is apparent that the story is not an organic whole. Taken separately, there are many remarkable scenes, many close studies of motive and character; but there is no coherence, no development of one from the other. As it stands, the contradictions prevent illusion. The best of the book is the picture of the heroine in the first flush of her success, but that perfection of person and of manner could never be the outcome of such a miserable girlhood. "A dwarfed and partial growth" carries the twist and the cramp to the latest day. The author would have us believe her beauty and her intellect an inheritance from her gently-born father, but that pushes too far the theory of hereditary traits, since his are only the negative ones, and the mother is a coarse virago. The author makes too much of his bad people. One quarter of the book is too much to give over entirely to sordid vulgarity of the meanest kind that could be honest. The fine ladies are too bitter in their rivalries. On the other hand, an ambition so deliberate and so heartless as the heroine's would have overpowered all sense of danger. It may be answered that her husband saves her; but the girl who could calmly plan her own career upon the basis of a loveless marriage would not, as a wife, have hesitated at any way of escape. The book is not a description of New York society, but only of a few people in it. The life of the very rich, its fastidious comfort, its insidious charm, is exceedingly well given; but beyond that there is no occasion for general inferences, even though there is not a noble woman in the whole story, and but two men who know what honor is.

'Beatrix Randolph' requires at the outset something of a pull upon credulity, or upon imagination, to accept the substitution from which the plot is developed. Thereafter the story is carried brilliantly on to certain fine and high issues which are never too common in these days of pessimism. So far as it goes, it does something toward answering the question what a high-minded American girl would do in a position of actual hazard, with nothing but her own traditions to aid her. Daisy Miller never had any traditions, and the Lady of the Aroostook was so carefully provided for (by the author) that no one ever knew what she could do. The story, brief as it is, is more of a description of society than 'An Ambitious Woman'; and the people, unlike Mr. Fawcett's (with the single exception of his hero), would be pleasant to know. Such a pair as the Dinsmores will offset a good many scheming parvenus and selfish exclusives.

'A Latter-Day Saint,' an anonymous society sketch, opens happily a new series of American novels. Though the confessions of Miss Jones can hardly be recommended as a guide to conduct for ingenuous youth, an ambitious débutante may glean from them invaluable hints. But before soaring, she must impartially weigh chances—all the physical and mental attributes, all the accidental circumstances, which may tell in her favor or against her. She must be absolutely unconscious of any heaven higher than that she sighs for, and if a single immortal longing disturb her breast, better she had never been born than that she should take counsel with Ethel Jones. This young woman was from her cradle *sûre de ses faits;* and before perpetuating in letters herself and her world, she had probed the truth at the heart of both with the cool hand proper to one who "always preserved a great contempt for emotion as a rule of life." As a story-teller, this gives her an advantage almost uniformly despised. She knows her subject, and, without wordy dissection of character or elaboration of motive, establishes from the first a cordial intimacy between her audience and her actors. She narrates her achievement of social greatness, and her subsequent life of "simple and unpretentious gayety," with the dispassionate directness and verisimilitude of Cæsar describing a campaign which he had planned and of which he was a part. She utters philosophy and sarcasm with a piquancy and good-temper which recall Thackeray's lighter manner without echoing it. Her language is as consistent as her scheme of life. Not once does she pander to that preference for literary elegance which is naturally part of the respectability of such people as those neighbors of hers, "who went away on account of what they called our scandalous behavior." She is mistress of the pointed, homely expression, of the metaphor drawn from every-day avocations, which stamp the caste of the Latter-Day Vere de Vere. If she is at once depressed and reckless, she "wants to go in and swipe, as the cricketers say." Wishing to define her way of consoling herself for a temporary dissatisfaction, she avoids metaphysical refinements and remembers "that little catchword of which Mr. Temple was so fond—'Patience, gentlemen, and shuffle'; I comforted myself and shuffled." The amusement afforded by the frank recital of a career glorious or inglorious according to the point of view, is heightened in that of the "conversion." The impregnable moral coming from such a saint is a delight to the soul of the sinner. For, if a politic woman who has lost her complexion and her hair, and almost lost her reputation, would still conquer worlds, she must approach them through abject propriety, judicious prayer (Anglican, of course), and a prominent place on the committee of an irreproachable charity.

The saying, of Oriental origin, "One thing is certain, the rest is lies," applies exactly to 'One False, Both Fair.' It is certainly rubbish. The ridiculous plot turns on the personation of a widow, Clare, Marchioness of Leominster, by her twin sister, Cora Carew. The Gordian knot is not tied by human skill aided by a god, but by

the effrontery of one head with a "twisted weight of golden hair" opposed to the fatuity of another head which is externally identical. Being tied, a five minutes' family council would have cut it as effectively as a hero's sword. But that method presupposes an ordinary family, whereas the author has provided only two extraordinary relatives, whom he has ruthlessly dragged from the quiet of a museum of curious antiquities. One is Lady Barbara Montgomery, the other, Sir Pagan Carew. Lady Barbara is variously labelled as the "Cat of Quality" and the "She-dragon of the Aristocracy." She responds to remarks from mild young gentlemen drinking tea, as a "war-horse to the trumpet call." Her personal appearance inspires a descriptive paragraph which may be definite, but undoubtedly is weird:

"She looked as a Montgomery might have looked when panting messengers came rushing to the stronghold on the steep to tell how the bare-footed, white-mantled Welsh were spreading havoc through the country, marching in force on Castle Vawr. . . . She would have been ready then with mangonel and arblast and falconet on the strong stone battlements to receive the onslaught of the furious clans from the West."

A firm foot on any sort of a battlement, and familiarity with awful, archaic implements of war, are obviously unavailable resources in the settlement of a modern mistaken identity case. And Lady Barbara's unfitness for such an emergency is only comparable to Sir Pagan's. It is positively asserted that he would have done great things under Effingham, against the Armada, but that "in the nineteenth century he was an anachronism, much as a sachem of the Pequods, in plumes and war-paint, would be in the bustling Massachusetts of to-day." The force of illustration, especially if one knows Boston, can no further go. Sir Pagan's natural disability is grasped. He could only preserve a masterly inactivity until wrong is made right by the production of the "nurse of ninety years" and the prehistoric strawberry mark.

'Diane Coryval' is a smoothly and pleasantly written story, the materials being largely drawn from what may be called a "general fund" for authors of slender resources. Impecunious lovers, callous fathers, and the all but deadly typhus are common enough in life. They are therefore legitimate stock-in-trade, and capable, as in 'Diane Coryval,' of being furbished almost to the freshness of a first appearance. Diane, though a victim of the hackneyed comparison with a lily, is an attractive figure, both in the artist-life of Paris and among her bucolic kindly kinsfolk in Picardy. She commands admiration by her struggle for self-support at the Pensionnat Gainber, and sympathy when she believes her lover, Réné St. Avon, faithless. But fondness feels ashamed when she marries Rupert Byasson. Not that Rupert is objectionable. He old and rich. He has the hands of a peasant, and wears his blouse; he has, besides, the honor of a chevalier and the simplicity of a child. He is a cherished figure in literature, and in reality must be as delightful as he is exceptional. Nevertheless, a sweet, pure, self-reliant young girl cannot marry him without exciting scepticism about her actual possession of those qualities with which she stands accredited. Diane is hardly redeemed by her later resistance against the returning and still loyal Réné. Indeed, their mutual victory over temptation seems less a natural and admirable development of character than a sop to the moral requirements of English readers. The most noticeable defects in the book are a vagueness of idea, an insecurity of method, which at times rouse the suspicion that the author has not borne in mind the thread of his story. The number of worthy people who die quietly in bed suggests either dearth of expedient or unconsciousness of the length of the death roll. When Réné tells Mme. Byasson that his promise to his perfidious father held him bound not to communicate with her for *two* years, the mind instantly reverts to the sixth chapter, where the agreement between father and son is made distinctly for *one* year. Though Réné is rather a shabby fellow, it is not fair to impugn his veracity. If the prefatory note, which excuses his abandonment of Diane in the first crisis, explained this discrepancy of statement as well, everybody would feel more comfortable.

If we were to meet Mark Langston and the other commonplace, pious settlers of "Dukesborough," in the flesh, we should feel bound by our traditions to respect them in silence. As they are presented to us in an alleged "tale," we can say freely that they are very dull, that they are bores. If such people did exist in Middle Georgia half a century ago, that is no reason why they should be thrust in all their rude mediocrity upon the novel-reading world of to-day. It is a gross imposition upon those who, on the whole, deal more kindly with the novelist than the novelist deals with them. The most infatuated realist cannot contend that truth without either idealization, imagination, or, at the least and lowest, exaggeration, is enough for art. Even if Mark Langston should be accepted as an intended exposition of plain, unvarnished truth, failures of intention are numerous. In the spasmodic working of the plot, all probability and much possibility are sacrified in order to make an incomparable villain of Kinsey Duke, who is after all but a coarse and uninteresting miscreant. As for the dialect, it may have been spoken in the South before the "slavery agitation troubles." At present we cannot conceive of any woman talking like Mrs. Toliver, unless she had studied and made her own the linguistic eccentricities of "Sairy Gamp," "Uncle Remus," and the lady just arrived from Cork and installed in our kitchen. That it is easy to be tiresome in fiction—hard, and every day getting harder, to be amusing—we admit, and have a wide charity for harmless, indolent prosing. But the author who combines jargon with pompous circumlocution has been at great pains to weary us. We can never forgive him; but nothing is easier than to forget him.

'La Comtesse Sarah' is M. Georges Ohnet's third novel, if we remember aright, and its editions have already, in the six months or so since it was first published, surpassed in number those of 'Serge Panine' and 'Le Maître de Forges.' Of the three books together, more than a quarter of a million copies have been sold. No three of M. Alphonse Daudet's or of M. Émile Zola's novels can show a more popular record than this. But M. Daudet and M. Zola have been long years in attaining their positions, while M. Ohnet has jumped to the front in three gigantic strides. The causes of his success are further to seek than the causes of theirs. M. Daudet has charm and M. Zola has force—to pick out the most obvious of their qualities—and M. Ohnet has neither in any marked degree, or, indeed, any other of the qualities of the great novelist save one: his novels are interesting. He has recognized Anthony Trollope's distinction between having to tell a story and having a story to tell. M. Ohnet has always a story to tell, and his story is always interesting. His characters are not very new or very true, but they are sufficient. His plot and incident are rarely startling in their novelty. His dialogue and his descriptions are not of a merit exceptional enough to be singled out for special praise. He is well equipped on all sides, but he nowhere reveals peculiar genius. His success, we take it, is due to his having introduced a new form of novel—the novel which closely approaches the play. Mr. Charles Reade was on the verge of this invention, but although he filed his caveat he never took out his patent. M. Ohnet began as a dramatist, and his first novel, 'Serge Panine,' was a play before it was a novel. His plays are what are called "emotional" plays, and so his novels are "emotional" novels. They have the broad and passionate handling of simple situations which marks the most skilful work of Parisian dramatists. There is a swift movement of the story, and no time is wasted in dissertation, in description, or in dissection of character. M. Ohnet swerves not to the right or to the left; he ignores realism, and he is ignorant of accumulated detail. Even his characters are conceived in accordance with the requirements of the theatres; they are limned with a few free strokes of the charcoal. There is in 'Comtesse Sarah' no character as firmly drawn as the tragic mother-in-law in 'Serge Panine,' but the story itself is of even more breathless interest.

It is worthy of note that the chief situation in M. Ohnet's 'La Comtesse Sarah' is singularly like the chief situation in Mr. H. C. Bunner's 'A Woman of Honor.' The American story was written at least a year before the French, just as Mr. W. E. Norris's 'Heaps of Money' preceded M. Claretie's 'Le Million,' the subject of which was substantially identical. No accusation of plagiarism will fairly lie against M. Ohnet, because the situations, although alike in some respects, are so unlike in others that it is substantially impossible that one should have been suggested by the other. There is also a certain sort of resemblance, quite close enough to deserve record, between the duel scenes in 'Le Maître de Forges' and Mr. Charles Reade's 'Griffith Gaunt.'

Anecdotes of the Civil War in the United States. By Brevet Major-General E. D. Townsend, late Adjutant-General U. S. Army (retired). D. Appleton & Co. 1884.

LIKE a great many folks, we do not always read the preface of a book until we have finished the book itself. We had laid this book down with a feeling of considerable disappointment; we had asked ourselves how it was possible for a man in General Townsend's position during the great civil war, to have written his recollections, and have told so little of the really important matters that must have passed under his very eyes. We had said, in a word, that the book was far more remarkable for what it did not contain than for what it did. Then we glanced at the preface, and there we found the following frank admission:

"If they [these anecdotes] fall short of the expectations formed of one who was known to have filled positions of high responsibility in military councils during the most critical period of our country's existence, or fail to reveal some of the hidden reasons for certain measures, and the secret history of certain events which he may be supposed to know, it must be attributed partly to his conviction that in some matters the information confided to him was intended never to be made known; and partly to the fact that, while his advice and experience were always submitted to the higher powers when called for, he abstained from seeking knowledge which it was dangerous to the success of critical enterprises to have disseminated more than was absolutely necessary, content with understanding enough to insure an efficient execution of the authority intrusted to him."

We have given General Townsend's explanation in his own words, and we trust it will obviate in advance the disappointment to the future readers of his book which we frankly confess to have felt ourselves.

Taking the anecdotes, then, simply for what General Townsend intends them to be, we find

them interesting and varied. There is a great deal of the personal element in them, of course, but we do not know that that detracts in any way from their entertaining character. There are anecdotes of President Lincoln, General Scott, and Secretary Stanton, with many more of a miscellaneous description. Of General (then Colonel) Lee's resignation, General Townsend tells us that Scott sent for him from Arlington Heights, where he was staying with his family. Lee was at this time, April 19, 1861, Colonel of the Second Cavalry, and was on leave of absence. Scott told him he must prepare for active service; that those Southern officers who were resigning were making a fatal mistake; that the contest might be long and severe, but the issue would be eventually in favor of the Union. Lee simply stated that his property was in Virginia; that his children would be ruined if they did not go with their State; that he could not raise his hand against his children. With this the interview terminated. It is probable that Lee's sons were more in sympathy with the secession movement than their father was; and it is evident that Lee did not care to have any discussion of principle with his old chief.

General Townsend has done well in reprinting in his Appendix General Scott's "Views," dated October 29, 1860, his memorandum on "Reënforcing and Holding the Forts," dated December 28, 1860, and his letter to Mr. Seward, dated March 3, 1861, giving the four possible courses that might be adopted, the last of which was the permission of secession, embodied in the well-known phrase: "Say to the seceded States, Wayward sisters, depart in peace!" General Townsend points out that this last course is not the one favored by General Scott, and he calls attention to the wisdom of General Scott's recommendations for the garrisoning of the forts contained in his "Views," and reiterated in his memorandum of December 28th. In this connection there is an interesting statement made by Mr. Floyd at the reception tendered to him in Richmond, after he had resigned from Mr. Buchanan's Cabinet. Floyd says that Scott's plan "to stop secession was, like all campaigns devised by him, very able in its details, and nearly certain of general success." It was to transfer the army quietly to the Southern forts "Had Scott been able to have got these forts in the condition he desired them to be, the Southern Confederacy would not now exist." This was the opinion of a decided secessionist, and a man of considerable knowledge of the state of feeling in the South; and it is entitled to great weight. It amounts to this, that had the attitude of the United States Government been unmistakable, had it been clearly understood at the South that even a Democratic administration would use force unhesitatingly, that the secession movement inevitably meant war, the plan would not have been attempted. He may have been wrong, of course, but it is well known that the South, before the commencement of hostilities, was far from being ready to break the Union, and that the leaders in the enterprise of founding the Southern Confederacy did not expect, much less desire, a war with the Northern and Western States.

In March, 1861, however, the opportunity for checking the movement in advance had gone by; and General Scott seems to us decidedly to favor the first of the alternatives stated in his letter to Mr. Seward—namely, the adoption of the Crittenden compromise. This would, he urged, prevent the border States from joining the Confederacy; and he even predicted the early return of some of the States which had seceded. Without adopting some such course, the border States would, he thought, almost certainly join the South. In this he was right so far as Virginia and Tennessee were concerned. Moreover, nothing but force held back Maryland; skilful diplomacy backed by a show of force alone controlled Kentucky. His second course was to blockade the Southern ports, or collect their duties on ships outside them. On this he evidently placed no reliance, at this aggravated stage of the controversy. His third course, to conquer the South, is stated as a perfectly feasible thing. But to show how a sagacious man may guess wide of the mark, look at Scott's estimates: two or three years, 300,000 men, and $250,000,000. As a matter of fact, we employed in one way or another, in round numbers, a million of men, about fifteen times as much money, and it took four years.

But there is one most important item of General Scott's account in which his predictions have been most happily disappointed. He says the result would be "fifteen devastated provinces, not to be brought into harmony with their conquerors, but to be held for generations by heavy garrisons at an expense quadruple the net duties or taxes which it would be possible to extort from them, followed by a Protector or an Emperor!" Verily, fortune has been good to the people of this country. Who could criticise this gloomy prophecy at the time? Who could point to experience, to history, and show how exaggerated was the picture? No one, probably; but the fact that the experiment was tried in a new country, and a rich country, and an intelligent country, and in the latter half of the nineteenth century, had a great deal to do both with making our task more costly, and the result more completely and speedily successful.

There is a good deal that is entertaining and curious about the corps badges, and about the various devices for the Confederate flags. There is an interesting chapter on the celebration at Fort Sumter on the 14th of April, 1865, exactly four years from its surrender, when Major, then General Anderson, with a distinguished party went to the fort, and with his own hands hoisted over the shattered ruins the same flag that had been lowered on the 14th of April, 1861. There is an interesting facsimile of Anderson's despatch written on board the steamer *Baltic* on April 18, 1861—a very felicitous despatch, commemorating a not very remarkable feat of arms. General Townsend's book will be found light, pleasant reading. Had he taken a different view of his responsibilities, we should have found his book more valuable.

Acts of the Anti-Slavery Apostles. By Parker Pillsbury. Boston: Cupples, Upham & Co.

Saint Indefatigable. A Sketch of the Life of Amarancy Paine Sarle. By William F. Davis. Boston: D. Lothrop & Co.

It would be easy to find fault with the arrangement and literary style of Mr. Pillsbury's work. Its defects are to a great extent those of the sermonizer, as might be expected of a genuine apostle of abolition. Few, to be sure, of the author's colleagues possessed the historical faculty, or attempted, as he has done, an account of their personal experiences in changing public sentiment on the subject of slavery. Indeed, among those whose labors were almost wholly in the field, away from the great centres of propaganda and in living communication with the friends and foes of the cause, Mr. Pillsbury is, we believe, the first to review and chronicle his adventures in book form. And death has made such havoc with his old associates that in all probability he will be the last as well as the first. Want of modesty, however, is so far from being the cause of this distinction that Mr. Pillsbury's reminiscences would have gained considerably in value if they had been more, and more exclusively, personal. They in fact give a generous prominence to the doings and merits of his fellow-agent, the late Stephen Foster, and constantly "yield the floor" to that gifted friend of both, Nathaniel Peabody Rogers, editor of the *Herald of Freedom*, as an eye-witness and graphic reporter with whom it would be idle to compete. Rogers, Foster, and Pillsbury are the three leading figures in a narrative which is strictly confined to New England—to Massachusetts and New Hampshire in particular—and deals chiefly with the period from 1839 to 1842.

Mr. Pillsbury's mission overtook him when serving as a Congregational minister—licensed but not ordained—in a small New Hampshire town, at a time when sectarian division in the anti-slavery ranks had afforded the clergy generally a pretext for withdrawing from the movement and for entering actively into the ranks of the opposition. Disruption, too, upon the slavery issue, was threatening many of the great denominations and religious organizations; "come-outers" were multiplying; and the shortcomings of the churches became inevitably the main theme of abolition discussion. Mr. Pillsbury's moral earnestness and theological training well qualified him to join in exposing and denouncing a false Christianity and a faithless priesthood, and to make this in some sort his specialty to the end. His book is, after all, only the last word of it—a revelation to the present generation of the persecutions of the "Apostles" at the hands of the clergy; a reminder to the latter that no amount of whitewashing will conceal the responsibility of their predecessors for the needless prolongation of the struggle against the greatest immorality of the age. We recommend it to both classes as full of interest and instruction.

A few extracts will furnish a glimpse of the hardships of our New Hampshire lecturers. Here is Rogers's description of the reception of the trio at Sanbornton Square. The time of year is December (p. 110):

"The hour arrived, we resorted to the literary institution. It was a steeple edifice—meeting-house and town-house (Church and state) hard by, all in a row; all steepled and painted as white as so many 'whited sepulchres.' No light gleamed from the academy windows; all dark as 'the people covered with gross darkness.' We entered it; not a spark of fire nor a soul there. We consulted what to do. Four little boys came in, then one man, Deacon Lane, and a woman, then two young women, academy scholars, boarders at our friend Webster's, one more man, and lastly friend Webster himself, the abolitionist of Sanbornton Square, and our assembly was complete. Brother Pillsbury found the bell-rope and pulled it till the sound rang clear and loud all over Sanbornton hills. It agitated the cold night air, but not the colder hearts of the people. Brother Bodwell [the local Congregational minister] must have heard it like a knell in his study. Nobody else came near. Brother Pillsbury went to a store and bought a candle and *lighted the house*, wrapping a piece of newspaper round it and setting it in a corner of the desk. It threw its beams round upon the empty seats and the 'darkness visible' of the 'Woodman Sanbornton Academy,' the title, we believe, of this *Liberal* institution. We held a season of prayer, not with the full formalities of a meeting. We felt the desolate condition of the unfortunate people and their minister, and we prayed for them. Brother Foster followed, . . . and bore an appalling testimony against the place."

At Hancock, "the old Orthodox meeting-house had been obtained for our meeting" (it is still Rogers who writes), "it being so owned that the Very Reverend Father Burgess could not by his nod prevent our having it," though he warned his flock not to attend the three days convention:

"The godly children of the church rang that old liberty bell till they made it hoarse, and almost broke their young mobocratic backs with pulling the rope. It annoyed the village more than it did us who were down under it in the

house. We told them to ring in welcome. It was a free meeting, and every one of them was at liberty to take what part in it he chose. If he had no ability to speak against anti-slavery, he might ring the bell, or he might sneeze, or bark, or throw stones. There was one pro-slavery tailor in the entry that had sneezed with great ability. I never heard anybody that had such talent at sneezing. . . . He came into the meeting, and when any of the speakers touched on Mr. Burgess's connection with man-stealing, the tailor would sneeze in his defence. Others of his defenders would bark, some whistled, others scraped the floor with their hind feet. . . . But Foster . . . displayed Burgess in such condemning light as one of the great brotherhood of thieves and patrons of robbery and adultery in the slave system, that they could not bear it, and began again to show their religious rage. Several large stones were hurled in at the front door, and went tumbling up the broad aisle to the foot of the pulpit. . . . By-and-by smash went the glass, and in at the side windows came the stones. . . . Real clerical argumentation. Truly *religious* weapons of defence for the church and minister."

Harder to deal with than the mob was the simultaneous leaving of the audience by preconcert, as happened to Foster at Stratham. Oftener than not, however, it was Foster himself who quitted the building, involuntarily, especially if it was a meeting-house, for he felt it to be his duty to rise and rebuke the church assembled in its own sanctuary. From Canterbury jail he wrote to Rogers on February 15, 1842:

"When I dare look on my shattered form, I sometimes think prisons will be needed for me but little longer. . . . Within the last fifteen months, four times have they opened their dismal cells for my reception. Twenty-four times have my countrymen dragged me from their temples of worship, and twice have they thrown me with great violence from the second story of their buildings, careless of consequences. Once, in a Baptist meeting-house, they gave me an evangelical kick in the side which left me for weeks an invalid. Times out of memory have they broken up my meetings with violence, and hunted me with brickbats and bad eggs. . . . Once, in the name of outraged law and justice, have they attempted to put me in irons. Twice have they punished me with fine for preaching the gospel; and once, in a mob of two thousand people, have they deliberately attempted to murder me. . . . Still, I will not complain, though death should be found close on my track. My lot is easy compared with that of those for whom I labor. I can endure the *prison*, but save me from the *plantation!*"

Mr. Pillsbury devotes the second chapter of his book to a personal sketch of Rogers, repeating, by the way, the traditional error about his descent from the martyr, John Rogers—as to which Colonel Chester's interested researches avail more than "the remarkable resemblance" of N. P. Rogers to the portrait of John in the possession of the Antiquarian Society at Worcester, Mass. He is purposely silent about the unhappy alienation of the editor of the *Herald of Freedom* from his warmest friends among the Massachusetts abolitionists. A very partial and inadequate hint of this important episode will be found in Mr. Davis's little sketch of 'Saint Indefatigable' (whom he pronounces "the most remarkable woman in Rhode Island" at the time of her death, some two years ago). For this reason, as well as because incidentally Mr. Pillsbury's record of his own apostleship is supplemented, we have coupled the two books in the present notice. Mr. Davis's generalizations (as on pp. 16, 17, 22) concerning the aims and dissensions of the abolitionists are not discriminating or trustworthy, and Miss Paine's relations to Rogers and his faction cannot be fairly judged from her correspondence with Mr. Quincy, without further knowledge of the nature of the controversy. However, the letters shed some light on the attitude of the parties, and derive some in turn from Rogers's own writings as quoted copiously by Mr. Pillsbury. When the Rhode Island Anti-Slavery Society, of which she was the secretary for ten years, expired in 1853, Miss Paine, who presently became Mrs. Sarle, turned her energies into all manner of charitable works with marvellous persistency and endurance. She finally went back to the church which, while under Rogers's influence, she had "come out" of by way of protest against it "as an organized body," and much of her Samaritanism was in the line of her "church work." The congregation when she originally joined it was capable of very good anti-slavery resolutions, while maintaining a place apart in the gallery for African communicants. From a sense of duty, she took her seat with these outcasts. It is singular that after subsequent years of official prominence as an abolitionist, and even after the war, she should on a certain occasion, if we may trust Mr. Davis's account, have shrunk from riding through the streets in a carriage, and hesitated to share an emergency bed, with a pauper negress whom she was maintaining—on account of her color.

Methods of Teaching History. By Dr. G. Diesterweg, Professors Herbert B. Adams, C. K. Adams, John W. Burgess, E. Emerton, W. F. Allen, and Mr. Thomas Wentworth Higginson. [Pedagogical Library. Edited by G. Stanley Hall. Vol. I.] Boston: Ginn, Heath & Co. 1883. 12mo, pp. 207 and 92.

Dr. Hall's 'Methods of Teaching History' was intended, we are told, "to be the first of a series entitled a Pedagogical Library, devoted to methods of teaching, one volume of which was to be occupied with each of the more important branches of instruction in grammar and high schools." Even if "the appearance of subsequent volumes in the series is not yet assured," the designation as vol. i. on the title-page holds out an expectation which it is to be hoped may be realized, and the general excellence and helpfulness of the book before us ought to secure it many readers. It is in three parts. Part 1, translated from the German of G. Diesterweg, is a systematic treatise upon instruction in history, and we cannot better indicate the scope of the work than by giving the titles of its eight chapters. These are: the meaning of history; the use of history; modes of writing history; limit of subjects; arrangement of the material; manner of treatment and tendencies; outlines of instruction in history; means of instruction. These subjects are all suggestive, and we need only say that each is treated with great judgment, so that all teachers of history can obtain valuable suggestions from them. The translation is, so far as we can judge, accurate; it follows the original, however, too closely, so as sometimes to fail in idiomatic rendering. The selection of history as the subject of the first volume of this library is a testimony to the growing recognition of the importance of this branch of study. It may be suspected that new classes are formed in history more rapidly than well-qualified teachers are found ready to take charge of them. We can, therefore, heartily recommend the present essay, as well to teachers who are conscious of deficiencies in their preparation, as to principals and school boards who wish for assistance in laying out courses of study. It contains few details of fact, but an excellent summary and analysis of principles.

If the subject of the volume bears testimony to the tendencies of an educational system, in laying more and more stress upon history, the tone and treatment of the separate essays which compose the rest of the volume, are equally significant indications of the tendencies of methods of instruction. Every one of these essays, except the two short ones upon Physical Geography and "Why do children dislike history?" by Colonel Higginson, is devoted to a discussion of the best method of teaching history by original work, upon original materials. In other words, the aim of all these teachers is to adapt the methods of physical science to the study of history. The scientific method of investigation has prevailed in historical study as well as in the natural sciences, certainly from the time of Wolf and Niebuhr; the reform consists in applying it to the instruction of the young; and here, we cannot doubt that the method, even in the German seminaries, which are the model in several of these papers, was borrowed from the methods of the instructors in physical science. It is very interesting in the comparison of these papers, each contributed "without knowledge of what the others had written," to see how steadily this object is held before the mind of each writer. The methods of instruction, whether borrowed directly from the German *Seminar* or arrived at by individual experiment, vary very much in detail, but are identical in spirit and aim.

Part 3, of 92 pages, contains the special paper of Professor Allen, followed by a selected list of books of reference and reading, and two lists of topics for special study in general dynastic and in American history.

Geology of the Comstock Lode and the Washoe District, with Atlas. By George F. Becker, Washington.

This is the title of No. 3 in the series of Monographs of the United States Geological Survey. An abstract of this paper was published a year or more ago in the second annual report of Director Powell, and now the finished work, a quarto volume, has been issued from the Government office. It is accompanied with twenty-one unbound folio atlas sheets, beautifully lithographed by Julius Bien, besides which the book contains seven plates from the same source, and thirty-three woodcuts.

The great economical importance of the Comstock Lode, the source, since 1859, of more than $300,000,000 in gold and silver, has naturally made it an interesting field for scientific investigation. Within the last twenty years the nature of its rocks and ores, the structure, physical condition, and chemistry of the vein, and the mode of occurrence of its wonderful deposits have been the subjects of elaborate studies and treatises by Baron von Richthofen, King and his assistants of the Fortieth Parallel Survey, Church, and others. It is now thirteen years since Mr. King's report and maps were published. Since that time the development of the lode has been enormously increased. The depth of workings has been extended from about one thousand to three thousand feet; the great bonanzas of the Chollar-Potosi, Belcher and Crown Point, Consolidated Virginia and California, yielding together over $160,000,000, have been discovered and exhausted; the Sutro Tunnel has been completed; and the opportunities for interesting observation and the material for scientific study have been vastly enlarged. To this field of inquiry Mr. Becker has devoted himself with great industry and care; and his report will doubtless be examined with close attention by many who are interested in the scientific aspects of mining work. The lithology of the district has received a large share of Mr. Becker's attention, and among other notable results is his conclusion that the so-called propylite of Richthofen has no sufficient standing as an independent rock species. The rocks so described are really, by Mr. Becker's showing, various Tertiary and pre-Tertiary rocks, reduced to a nearly uniform appearance by decomposition. The name of propylite has already gained some

popular acceptance; and many a prospector in other regions, anxious to trace a geological relation between the great Comstock Lode and his own new discovery, will learn with regret that the name by which he has been pleased to describe his favorite formation must be stricken from the list of rocks. Mr. Becker's study of the chemistry of the lode leads him to the belief that its precious metals were probably derived from the hanging-wall rocks which, when fresh, were argentiferous and auriferous, thus affirming the theory of lateral secretion. The high temperature of the lode he attributes to a deep-seated source of heat, probably of volcanic origin, and not to the kaolinization of feldspar, as suggested by Mr. Church. The structure of the lode and the mode of occurrence of the ore-bodies are discussed at length with the aid of elaborate maps of underground workings and geological sections. In the preparation of these maps Mr. Becker had the very valuable assistance of Mr. R. H. Stretch, who, years ago, rendered similar service in the work of the Fortieth Parallel Survey.

Under existing rules the monographs of the Survey are not distributed gratuitously. They are for sale at cost of publication. The price of this volume with atlas is $11. Application should be made to the Director of the United States Geological Survey, Washington, D. C.

The History of the Year. A Narrative of the Chief Events of Interest from October 1, 1882, to September 30, 1883. London, Paris, and New York. 1883.

THIS is the second 'Year' of Cassell & Co.'s popular annual. The publication is in several respects an improvement on similar ones in English and French. It is concise, readable, of varied contents, and comprehensive to a degree. The plan of making the year begin with October and end with September has the advantage of presenting the annual to the reader at the close of the period the retrospect of three-quarters of which it offers—that is, at the time when a retrospective glance over events lived through, but indistinctly remembered, becomes most naturally desirable. From a mercantile point of view, the advantage is more obvious still. Historical year-books which, like Appletons' 'Annual Cyclopædia,' appear in the spring, may be useful and handy additions to a library of reference—as are eminently Schulthess's 'Geschichtskalender' and the exceedingly comprehensive 'Jahres-Supplement' to Meyer's 'Konversations-Lexikon'; but they are issued at the wrong season for both reader and publisher. Most publications of this kind—the German ones, as a rule, excepted—are mainly concerned with events in the political, intellectual, and social life of the country in which they are published. The year-book before us is very strongly British in its contents and tenor. It devotes 170 pages to the political affairs of England and her colonies, and only 125 to those of all other countries. Its chapters on "Religion and Morals," "Literature," "The Drama," "Music," "The Fine Arts," "Sports and Athletics," and "Fashion and Dress," as well as the various statistical appendices, refer exclusively to things and movements in Great Britain. Only the chapters on "Trade and Finance," and the "Obituary" are of somewhat more universal interest. The obituary notices form the most poorly-executed portion of the volume. From those of Louis Blanc and General Chanzy, for instance—though they are not devoid of details—the reader would never learn that the former had any share in the revolutionary events of 1848, or that the latter was ever defeated during the war of 1870-71. Comparatively the fullest part is that devoted to "Sports and Athletics," which by its scrupulous minuteness in narration ought to satisfy the most curious devotees of cycling, football, cricket, etc. A little less of this or about fashions, and something, instead, of German or other foreign literature, would certainly have raised the year-book's literary level; but this is far from being low as it is, and most of the sketches depicting the political and intellectual movements of the twelvemonth are, indeed, done with attractive ease, freedom from prejudice, and adequate knowledge. The information and accuracy of the writers and of the revising editor, however—as usual in English or American compilations—become very inadequate in matters requiring some knowledge of the more rarely-studied languages, or a close comparison of various accounts, if errors are to be avoided. Hence a multitude of such incorrectly-rendered, or in revision uncorrected, names as Christies, Ranavola, Zagorien (a district transformed into a town, p. 252), Indejkin (for Sudeikin, p. 254), Bristritza, Pejasevics, Bisenbecker (for Eisendecker, p. 291), or *Czechenyi* (for Széchenyi, p. 396). The external appearance of the annual is pleasing.

Mosaics of Grecian History. The Historical Narrative with Numerous Illustrative Poetic and Prose Selections. A Popular Course of Reading in Grecian History and Literature. By Marcius Willson and Robert Pierpont Willson. Harper & Bros. 1883. 12mo, pp. 554.

THE title-page of this work explains sufficiently its plan and object, which is very well carried out, with, as we think, rather an excess of illustrative selections. The narration is in a plain, serious style, perhaps somewhat heavy, but in general in good taste. We have here another example of the effort, so common nowadays, to make history "interesting to all classes of readers"; and the editors deserve commendation for not having tried to make it interesting by lowering its tone. Still we are inclined to think that the superabundance of poetical extracts—giving the book in reality the look of a "mosaic"—will be found to be in the way of the desired result. A narrative history can be made interesting to the mass of readers only by superior power of narration. The story must carry the reader along by its own intrinsic merit, and the boy who is eager to read of Marathon and Thermopylæ will certainly skip the verses of Haygarth, Thomson, and Juvenal, even if the mere opening of a book so full of poetry does not repel him. The fact is, ancient history is so far removed from our modern point of view, that there is very little of it but the stories that can be made really interesting to any but students of thought and institutions. Rather a disproportionate amount of space is given to literature, and, indeed, the 'Mosaics' seems to us better as a history of literature than as a political history. We are surprised to find that the old traditions about Lycurgus and Draco, for example, are given as unquestionable facts.

Suggestions to China Painters. By M. Louise McLaughlin. Cincinnati: Robert Clarke & Co.

THIS little book is evidently intended for people who know little or nothing about art. The introduction says: "Before passing to the consideration of painting on china, I would like to say a few words to novices in the art upon the necessity of learning to draw before any attempt at coloring is made" In fact, decorative ceramics in which the necessity of such warning is made painfully evident are so abundant as to become a social nuisance, intolerable to any one who knows art even moderately well. It is possible to overlook the lamp jars and other bulbous vases which show this precocious running into pigments, unless the fond and proud executioners, or their husbands or relatives, ask your opinion of them; but that incitement to crustiness is too common for anybody to hope for impunity. The rule under such emergencies, for people who regard art seriously, ought to be that when they enter a parlor where this class of work is exhibited, and cannot escape without being seen, to make instant declaration of color-blindness and utter indifference to art in all shapes and grades.

If there is any young person of either sex in a condition to require the instruction of this little book, and having the intention to enter into the "china" decorating business, we have only the famous advice of *Punch* to offer—Don't; and if they *will*, to say that, while its practical directions may be followed, the chemical operations had better be performed with the aid of some work on chemistry. Such a laboratory direction as the following is only intelligible to one who does not need it: "The nitrate of bismuth is formed from the precipitation by water of a solution of bismuth in nitric acid." The illustrations are in black and white, and therefore of little use to the student in color—which is matter for rejoicing, in our way of looking at the subject.

Due West; or, Round the World in Ten Months. By M. M. Ballou. Boston: Houghton, Mifflin & Co. 1884.

COMPILERS are not, as a rule, good authors, and the sprightly fireside traveller who invades all literature for "pearls" and "treasuries of thought" succeeds poorly when, as one of Cook's protégés, he commits his diary to print. Even the fact of a "personally conducted tour" does not in this case give sufficient reason for a book. Mr. M. M. Ballou's mosaic work is known and appreciated on drawing-room tables and in ladies' boudoirs. As a compiler he tunes young pulses to his roundelays, but he turns proser when he comes and stays with his own dreary commonplace. The three hundred and eighty seven pages of copy from his diary are solidly printed, but unrelieved by anecdote, colloquy, or other helps to mind and eye. Most of the paragraphs occupy a page, and it is a rare, very rare treat to find the monotony of small pica broken by more than two paragraphs. These, however, would be trivial criticisms, were the matter strictly in accord with fact or faithful in color. One need not expect to find excess of accuracy, as it is evident that the tourist was either unwilling or not always able to separate the fruits of previous and out-of-date reading from those of observation. Hence we find, in his sketches of the kingdoms glanced at, frequent statements of what was fact a decade ago, but is not now. Even the contents of the guide-books, reduced to pulp in his pages, are bleached of their native color; and though the author occasionally helps us to a pinch of Attic salt from his cyclopædias of quotation, we look in vain for one good honest extract from local guides, whether in flesh or in ink. One is strongly tempted to suspect that the whole manuscript of 'Due West' was finished on deck or by rail, and was substantially ready for the Riverside Press July 24, 1883, when the ten months' flying trip was over. For those who wish to compass the world between two New Year's Days, and have neither the time to do preparatory reading nor the originality to choose their own routes, the book may have value.

BOOKS OF THE WEEK.

Adams, C. F., jr. A College Fetich. New Edition with Supplementary Matter. Lee & Shepard.
Argyll, Duke of. The Unity of Nature. G. P. Putnam's Sons. $2.50.
Bates, Arlo. The Pagans. American Novel Series. No. 2. Henry Holt & Co.
Ballou, M. M. Due West, or Round the World in Ten Months. Boston: Houghton, Mifflin & Co. $1.50.
Brockhaus' Conversations-Lexikon. 13th edition. Parts 95-100. New York: L. W. Schmidt.
Buchanan, R. The New Abelard. Harper's Franklin Square Library. 15 cents.
Carpenter, Canon W. B. My Bible. Cassell & Co. 40 cents.
Carpenter, W. L. Energy in Nature. Cassell & Co. $1.25.
Cooke, J. E. Bonnybel Vane. Harper & Brothers.
Crawfurd, O. English Comic Dramatists. D. Appleton & Co.
Daryl, P. La Vie Publique en Angleterre. 2d ed. Paris: J. Hetzel et Cie.
Du Maurier, G. Pictures of English Society. From *Punch*. D. Appleton & Co.
Düntzer, H. Life of Goethe. Translated. Macmillan & Co. $2.50.
Eckstein, E. Prusias: A Romance of Ancient Rome under the Republic. Translated from the German by Clara Bell. 2 vols. W. S. Gottsberger.
Fleming, George. Vestigia. A novel. Boston: Roberts Brothers. $1.25.
Frith, H., and Allen, E. H. The Language of the Hand. George Routledge & Sons. 50 cents.
Galton, F. Life History Album. Macmillan & Co. $1.25.
Galton, F. Record of Family Faculties. Macmillan & Co. 90 cents.
Gemmill, Jane W. Notes on Washington, or Six Years at the National Capital. Philadelphia: E. Claxton & Co. $1.25.
George, H. Social Problems. Belford, Clarke & Co. Cloth, $1; paper, 50 cents.
Greey, E., and Saito, S., translators. The Loyal Ronins: an Historical Romance. Translated from the Japanese. Second edition. G. P. Putnam's Sons. $1.75.
Guernsey, A. H., and Davis, Dr. I. P. Health at Home. D. Appleton & Co.
Hall, G. S. Methods of Teaching History. Pedagogical Library. Boston: Ginn, Heath & Co. $1.30.
Hodgdon, Josephine E. Poems from the Works of William Cullen Bryant. Series of Leaflets from Standard Authors. D. Appleton & Co.
Hunt, Prof. T. W. Caedmon's Exodus and Daniel. Edited from Grein. Boston: Ginn, Heath & Co.
Jackson, Rev. G. A. The Post-Nicene Latin Fathers. D. Appleton & Co.
Johnston, A. S. Camping Among Cannibals. Macmillan & Co. $1.50.
Kelley, Lieut. J. D. J. The Question of Ships. The Navy and the Merchant Marine. Charles Scribner's Sons. $1.25.
Kirby, F. O. Diseases and Injuries of the Horse. William Wood & Co.
Lathrop, G. P. Newport: a Novel. Charles Scribner's Sons. $1.25.
Miller, Joaquin. Memorie and Rime. Funk & Wagnalls.
Mott, H. A. The Air we Breathe and Ventilation. John Wiley & Sons. $1.
Murray, J. A. H., and others. A New English Dictionary on Historical Principles; founded mainly on the Materials collected by the Philological Society. Part I., A—Ant. Macmillan & Co. $3.25.
O'Donovan, E. Merv: a Story of Adventures and Captivity. Funk & Wagnalls. $1.
Old Lady Mary. A Story of the Seen and Unseen. Boston: Roberts Brothers. 75 cents.
Patents on Inventions. A Quarterly Patent Law Review. Vol. I. Burke, Frazer & Connett.
Pollock, F. The Land Laws. English Citizen Series. Macmillan & Co. $1.
Ponce de Leon, N. Diccionario Tecnológico Inglés-Español y Español-Inglés, Part 5. New York: 40 Broadway. 50 cents.
Rein, Prof. J. J. Japan: Travels and Researches undertaken at the Cost of the Prussian Government. Translated from the German. A. C. Armstrong & Son. $7.50.
Riddell, Mrs. J. H. Susan Drummond. A Novel. Harper & Brothers. 20 cents.
Riehl, W. H. Culturgeschichtliche Novellen. Cambridge (Eng.): University Press.

Robertson, W. Life and Times of the Right Hon. John Bright. Cassell & Co. $2.50.
Scribe, E. Bertrand et Raton: Drame. Wm. R. Jenkins. 25 cents.
Seeley, L. B. Horace Walpole and his World: Select Passages from his Letters. Scribner & Welford.
Sidgwick, A. Fallacies: a View of Logic from the Practical Side. International Scientific Series. D. Appleton & Co.
Shields, J. D. The Life and Times of Sergeant Smith Prentiss. Philadelphia: J. B. Lippincott & Co. $2.50.
Stanley, Dean. Lectures on the History of the Eastern Church. New edition. Charles Scribner's Sons.
Staunton, Lieut. S. A. The War in Tong-King. Boston; Cupples, Upham & Co. 25 cents.
Stevenson, R. L. Treasure Island. Boston: Roberts Brothers. $1.25.

Fine Arts.

THE ETCHING CLUB EXHIBITION.

THE collection of etchings on exhibition at the Academy in conjunction with that of the Water-Color Society, while to a certain extent marked by the same tendency to rest content with superficial success which we noted in the water colors, has the advantage of showing the work and its results in the nude simplicity of line, the faint advantage to be gained by artistic printing not carrying much weight. And the quality of the work is generally better than that of the associated exhibition; there are a few sterling works which quite justify, as achievement, the *furore* for the etching point and acid which seems to have taken the place, to a certain extent, of chalk and paper among our painters. But is not, on the whole, etching claiming in our day an importance which is out of all relation to its capability, and threatening to belittle and cheapen all line engraving to an extent dangerous to the general interest of artists? How many of the etchings now published here or in England merit, *as art*, the honor of reproduction? How many of the etchings here exhibited are worth keeping in a collection of works excellent in their kind, or have any more artistic value than a pen-and-ink sketch?

The passion for etching is an outgrowth of that morbid tendency to exalt individuality above all other qualities of art which is the vice (so it seems to us) of the painting of our time, and which is, after all, only a sort of apology for the lack of the great qualities of art which were the aim of the "old masters," who are practically the only great masters the world has seen. In the great schools of art, properly so called, we recognize more or less the individuality of the individual painter, but only in a remarkable and incisive degree that of the school. We have recently had a notable example in the "Apollo and Marsyas," which Morris Moore has sold to the Louvre as a Raphael, but which Morelli, the closest and most scientific connoisseur of the Italian schools, pronounces to be by an unknown hand, and which critics have variously attributed to painters from Timoteo Viti to Perugino—an exquisite picture certainly, but one of which no one is able to satisfy the majority of critics as to its authorship. As Morelli says, "originality was altogether differently understood in those times," and the end of ambition was to make a good picture according to the light of the day, no man fearing to resemble a greater than himself; and (all being educated from childhood to regard good drawing and painting, sound color, and harmonious composition as the end of study, and to follow in these respects whoever went beyond them, without regard to being recognized in their own pictures) the concurrent and consecutive efforts attained great and monumental art. Nowadays what is, in most painters, the end of labor, is to show their hand. What Giotto drew an O for, we paint pictures for. A man has scarcely learned the elements of his art as an amateur or student but he begins to study out some eccentricity, some peculiarity of style or manner which shall make his work distinctly to be recognized among that of his contemporaries. It is a trifling with art—exaggeration of the personal, instead of self-effacement and sinking all in the ideal of excellence of the true schools of art. A great painter will in some way stamp his name on his work, though we find that the great schools were so closely bound together that we continually have to take from one of their masters, as a result of research, the honor hitherto given him and give it to another. Nowadays the only similitudes are simulations: the counterfeiter takes the place of the pupil, and this is made all the more easy because these sought-out characteristics of individuality or originality are invariably superficial and imitable by a superficial workman. Art all the world over (less in Germany, perhaps, than elsewhere) shows honest endeavor for true excellence in the nobler qualities of art more and more giving way to eccentricities, and the *cachet* of personality sinking down to *chic*, which is simply the settling down on the lowest level (dead level, too) of this morbid originality. Only when we have a standard of art which shall make affectations of originality in art as absurd as we know them in conduct, shall we be able to eradicate the vice of eccentricity, which is simply the vanity of art.

And this is the tendency on which etching rests its new-born enthusiasms. At its best etching can never compare with the work of properly trained line engravers in the expression of the highest qualities of art. Imagine the Madonna di San Sisto in etching! It is in the picturesque qualities that it shows its best points, but even there line engraving includes it, and that point alone in which it seems to be supreme is in the autographic quality—that which in its exaggeration is the vice of modern painting. There is no question of the fascination of etching and etchings, but is it on the whole a gain either that we should have etchings instead of engravings of the greatest even of modern works, not autographic; or that the rank and file of painters and designers should fire at us their volleys of reduplications of work which is only tolerable as study of incomplete and struggling aspiration? When art runs into fads we need have no doubt that it is the vogue and not art that is in question. If we are not ready to say that we are sorry to see so many etchings in this exhibition, we can frankly say that we are sorry to see so many that have no evidence of sincere study or other aim than to give permanence to a study which at best ought to be merely tentative.

Good work, and honest in every sense of the word, and distinguishable mainly by its excellence and the masterly precision and accentuation of its leading lines, is Mr. Moran's "Apple Orchard," No. 136, the drawing of the tree forms of which is equal to any commendation we could give it, and the qualities of nature aimed at in which are those which etching can best render, and for which in line engraving it would be naturally employed. Mr. Moran's other exhibits have the same quality of distinct accentuation of those lines which indicate the most important facts, but they are less fortunate in the subject, except the Tower of Cortez, which we have noticed in its place in the volume to which it belongs. There are some etchings by Mrs. Moran which are remarkably like those of Mr. Moran, but the difference is at once perceived when one sees in the work of the lady long wandering lines which seem to have no particular relation to any form, but to have been put in from idleness. Any leading line which has not a definite meaning in relation to facts of nature or the composition of the subject, is evidence of weak draughtsmanship or want of purpose. "Under the Sassafras Trees" is, except for the weakness, good work, if not to be placed in the same category as that of Mr. Moran.

There is in the etchings from Rembrandt by James S. King, No. 74, and No. 75 from Hals, some of the best work in the exhibition. The success of the artist in rendering the subtle modelling and refinement of character in the light of the flesh and the clearness of shadow, in which no form is lost, go as near to giving the qualities of line engraving as any etching we can recall, and may be taken as of the very best form of etching in which, if not in engraving proper, we may be content to have great work reproduced. The "Vesper Hour," although giving the impression that the picture owes more to the etching than ought to be the case, is an admirable work, with a notably right method and excellent qualities of tone. The light and shade of the group of figures, its happy massing and large gradation, and the luminousness of the shadows, are most remarkable in so large a work. Mr. King may be confidently looked forward to as an example to our younger students who want to see what etching ought to be.

Mr. Farrar's etchings after drawings which we were able to praise so unreservedly in the water-color rooms, show that the artist does not distinguish the qualities which belong to black and white and those which are given in color. The etching of the "Sunset," No. 56, which is a reproduction of a twilight effect with a golden and glowing sky—a successful drawing in all its attempts, *i. e.*, tone and broad sunset effect—is singularly ineffective and unsubstantial. The reason is simple: the artist has attempted to translate directly as black and white a drawing whose brilliancy is due to color, without any of the compensation which the loss of color makes necessary. The white and black must be reënforced in such cases, and the tone translated into terms which shall give the etching the force of the original. This is characteristic of all Mr. Farrer's etched work, and it is not explicable until one sees the drawing and the etching from it together.

Very good renderings of broad white and black effect are Mr. Gifford's "Edge of an Orchard," No. 63, and J. H. Hill's "Evening" No. 69, and a twilight study "Evening," by E. F. Miller, No. 100. "Old Willow Trunks," No. 103, by E. H. Miller, is good study, and Mr. Monks's sheep studies, especially No. 122, are better even than his water-color drawings of the same subjects. Mr. Champney's No. 20, "Shy," is straightforward, good work. Mr. Van Elten has a number of etchings which are to the first sight very taking, and lack but little to be thoroughly good. What they do lack is, however, apparently beyond the artist's perception, *i. e.*, a larger treatment of his masses, and breadth in his light and shade. When an etcher attempts light and shade effects he must keep his masses broad and simple or he only gives the effect of unsubstantiality to his landscape and flimsiness to his etching. The best of his contributions is No. 213, "Glimpses of the Lake." Benjamin Lander's "Among the Daisies," No. 78, is a well-studied etching, and some of Mr. Pennell's contributions are singularly picturesque, but with great inequalities. The "Venetian Telegraph Office" is the most satisfactory as a whole, being very delicate in its architectural lines, and having less of that vague, meaningless scrawling in the foreground which so often mars his work. Mr. Pennell has yet to learn that a line that means nothing is a line out of place. His distant shadows are too often devoid of the gradation which every distance has, and come up with an exaggeration of strength which destroys their own value; the quality of a distant shadow does not lie in its depth, but in its sharpness and flatness. J. D. Smillie's "Fontarabia" street scene, No. 196, is right in purpose and well put into black and white, and Shirlaw's etching of the heads in "The Reprimand" is admirable in the delicacy of modelling and intensity of expression. Of Mr. Parrish and some others we have spoken fully elsewhere. The foreign work is in some respects exemplary, but we confess to a heretical irreverence for work like that of Seymour Haden and Whistler even, whose best qualities are not art qualities, but those of etching. We are sufficiently indifferent to the *chic* of etching to prefer Mr. Moran's work to Mr. Haden's, and Mr. King's to Mr. Whistler's. The etchings from J. F. Millet by Dollet, Nos. 43 and 44, show excellently, with great vigor and artistic quality, the relative value of etching and engraving. If these etchings are to remain such, they are simply good reproductions of the main motive of the pictures; if a preparation for engraving, they are all they need be; but to suppose that they represent Millet's pictures as they now are, is not to know his art.

Laguillermie's rendering of two pictures (of which one, after Munkacsy, would to our mind be more desirable, if unique, than Munkacsy's painting) gives almost, if not quite, all that we can hope for in this vein of picture reproduction. Mr. C. O. Murray, in "Music O'er the Sea," No. 140, will teach (if they will learn) some of our etchers how to etch water as well as to model a head, for the bargeman's head is scarcely less fine in its modelling than if it were in line, and the sky and distance are exquisite. The little girl's head, however, shows how far from certain even so good an etcher is of the delicacy of gradation needed for flesh. Martial's "Cancalaises" needs no commendation. It and he are well known, and among pure etching this is a leading work. Besides the sky of Mr. Murray's "Music," we should like to call the attention of our younger etchers to the sky in Johnson's "Ravine of the Thieves," No. 73, as they can see the difference between honest cloud drawing and random scratches across the sky to express something, somehow. Two etchings by Corot may enforce the difference between flimsy work and subtle, between a light hand and a careless one.

Henry Holt & Co.

HAVE READY IN THE
AMERICAN NOVEL SERIES:

No. 2. The Pagans.

By Arlo Bates. 16mo, $1.00.

And a SECOND EDITION of No. 1—

A Latter-Day Saint.

Being the Story of the Conversion of Ethel Jones, related by herself. 16mo, $1.00.

THE QUEEN OF ROUMANIA'S

Pilgrim Sorrow.

A Cycle of Tales by Queen Elizabeth of Roumania. Sq. 12mo, *with an etched portrait by Lalanze.* $1.50.

"A charming book—pathetic, graceful, and touching."—*London Spectator.*

"The last story is almost avowedly an allegory of the writer's own life. An admirable etching of the royal author is prefixed to the book, which will find many readers, partly from its undoubted merit and partly from its queenly origin."—*John Bull.*

HABBERTON'S

George Washington.

By John Habberton, author of 'Helen's Babies,' etc. No. 4 in the Series of Lives of American Worthies. 16mo, $1.25.

"Readers will not respect Washington less, but they will love him more for being enabled to see him in flesh and blood as well as in marble. We heartily commend the volume to young and to old. It is veritable history, but it is history in undress and not in court clothes."—*The Churchman.*

Johns Hopkins University,

BALTIMORE.

The JOHNS HOPKINS UNIVERSITY CIRCULAR for March, 1884 (*No. 29*), containing Notes from the various societies, laboratories, and seminaries of the University, is now ready. Subscription, $1 a year.

Address the Publication Agency of the Johns Hopkins University, Baltimore.

JOHN SAUL'S

CATALOGUE of New, Rare, and Beautiful Plants for 1884 will be ready in February with a colored plate.

It is full in really good and beautiful plants, as well as all the novelties of merit.

The rich collection of fine Foliage and other Greenhouse and Hothouse Plants are well grown, and at low prices.

To customers; to others, 10 cents; or a plain catalogues of Seeds, Roses, Orchids, Fruits, etc., JOHN SAUL, Washington, D. C.

E F Bickford 192 24 84

ZOLA, LA JOIE DE VIVRE.—

Feuillet, O., La Veuve.—Maupassant, Au Soleil.—Tissot, L'Allemagne Amoureuse. Each $1.25.

VASILI, SOCIETE DE BERLIN,

$2.10. Renan, Nouvelle Etudes d'Histoire Religieuse, $2.65.

Catalogues on application.

DIAMOND HAMS

S. DAVIS, Jr.'s BRAND, Cincinnati.

[From Report to State Department on American Hog Products.]

"I had the pleasure of going through the establishment of S. Davis, jr. & Co., Cincinnati, and of seeing the care and expertness with which the hams were handled, until they were packed ready for export; and, as this house may be said to represent Ham curing in the United States, it appears to me that no hams in the world can surpass the American for purity, cleanliness and flavor." Sold by leading Grocers in principal cities.

CATALOGUE for PRIVATE LIBRARY.—A blank-book of 240 pp., arranged with columns for entering Title, Author, Publisher, etc. Indexed through, alphabetically. Bound in boards, with leather back and corners; size, 8½ x 7¼. Price $2 50, post-paid. Sent on receipt of price, by Publisher of the *Nation.*

The Nation.

NEW YORK, THURSDAY, MARCH 6, 1884.

The Week.

THE decision of the Supreme Court as to the validity of the reissued legal tenders finally settles the question as to the control of Congress over the currency, and any settlement is better than such a state of doubt and uncertainty as has prevailed since the close of the war. The most singular thing about the decision is that it is nearly unanimous—Judge Field alone writing a dissenting opinion—although in 1870 the court decided, by a vote of five to three, that Congress had no constitutional power to make its notes legal tender in the payment of preëxisting debts. A change in the composition of the court resulted next year in a reversal of this decision by a bare majority, but four judges still maintained that the legal-tender acts were unconstitutional. The decision of the judges who supported the constitutionality of the acts was made to turn then upon the "war power"; that is, the power of Congress when the country is at war to do whatever is necessary to make war effective; but it was never clearly explained, either by these judges or by any of their supporters, how forcing creditors to take its notes from their debtors at par when they were quoted in the markets of the country at less than par, made it at all easier to put down the rebellion. The "war power" could not be introduced into the present case at all, because the notes on which it turned were received, under the act of 1878, in time of profound peace. The court has accordingly given up any attempt to resort to it at all, and rests the legal-tender acts solely upon the power to "borrow money" in time of peace as well as in war. The question when and how far the power ought to be exercised is "a political question, to be determined by Congress when the question of exigency arises, and not a judicial question to be afterwards passed upon by the courts."

Those who recall the early history of the legal-tender controversy will see at once that the judges, in their determination to uphold the acts, have reversed in a curious way the reasoning by which they were originally maintained. The real reason why the court originally resorted to the "war power" was because it was so strongly urged by most constitutional lawyers that the power to "borrow money" did *not* include the power to issue legal-tender notes. As the notes in this case were issued in time of peace, the court has now had to fall back on the very support which the judges then rejected as plainly too weak for reliance. The system of construction adopted in this case is one which weakens the court itself, and enlarges the power of Congress, and makes a long stride in the direction of centralization. The court insists upon the fact that Congress may, under the Constitution, pass all laws which are "necessary and proper" for "carrying into execution" its expressly granted powers; but this circumstance does not really strengthen their position, for this clause has never, from the foundation of the Government, been held to enlarge any of the powers expressly granted. Any further discussion of the power of Congress to make legal-tender notes would be a waste of time, but it is certainly not a waste of time to call attention to the fact that the court, in remitting the whole matter to Congress by this very latitudinarian system of construction, is really in so far abdicating the protection of private rights and private property against the encroachments of the Legislature.

It seems to be generally acknowledged in Massachusetts, as well as elsewhere, that the Boston Reform Club was rather too hasty in proposing a conference of "Liberal reformers" to nominate candidates for the Presidency and Vice-Presidency. Nothing is more necessary to a new party than a perfectly distinct conception of its wants. It is not enough to feel uncomfortable or discontented. The wisdom of waiting to see what the Democrats and Republicans will do, we believe, commends itself thoroughly to Independents in this State at least, and will certainly commend itself to their calmer judgment in every State. This waiting policy, too, is the best means of getting good nominations from one or other if not both of the conventions. The managing men on both sides are just now passing through a period of great perplexity, and we must be very patient with them. The problem before them is to satisfy "the boys" without offending the Independents, and it is one of enormous difficulty, the Independents have since 1882 become so haughty and exacting. The complete disappearance of the old ridicule of them from the party organs is one sign of the times which indicates a great deal. There is an evident disposition, indeed, on the part of even the most practical of the politicians "to pander," as the late Fernando Wood is reported to have once said, "to honesty and efficiency."

The President has made a change in the Pension Agency at Philadelphia which is a more flagrant violation of civil-service reform principles than the Biglin appointment was in this city. General Horatio G. Sickel, a soldier with an honorable record, has been Pension Agent at Philadelphia for twelve years. He has managed the office on strict business principles, and with such ability and efficiency as to command the approbation of all classes except the "boys." He took no active part in politics, and refused to "run" the office in the interest of the Quay-Cameron Machine. His continuance in office was warmly recommended by Senator Mitchell, by a majority of the Pennsylvania Congressional delegation, and by all the respectable citizens of Philadelphia. Against him were the "boys," who demanded the bestowal of the place upon one of their own number, John M. Vanderslice, who seems to have many of the qualifications for political position which are peculiar to the Johnnies of this latitude. Only one view of the appointment is held in Philadelphia and at Washington. The correspondent of the Philadelphia *Times* says it is universally regarded as evidence that the President "has entered into a contract with the Machine in Pennsylvania" by which the delegation is to be made solid for him. One of the Philadelphia Congressmen says the appointment could be paralleled in New York only by the removal of Mr. Pearson as Postmaster and the appointment of Barney Biglin in his place. Senator Mitchell and Judge Kelley are particularly indignant about it, and will make every effort to defeat confirmation in the Senate.

The only business event of importance during the week has been the virtual breakdown of the "bull movement" in stocks. This movement was mainly artificial, being no hing else than the desperate endeavor of a few large operators to draw the public into a speculation for an advance. It has failed completely, and the result has been an average decline of two and a half points during the week, following upon a decline of about two points in the previous week. Lackawanna has been an exception, having been "cornered" on Saturday to the great sorrow of the bears. It is one of the few properties selling at a higher price to-day than the quotation of one year ago. Gold to the amount of $3,500,000 in double-eagles has been drawn out of the Sub-Treasury, and it was for some days a puzzle to the Street what had become of it, since only $2,100,000 appeared in the treasure lists of outgoing steamers or in the inland shipments of the express companies. It was ascertained subsequently that it had been taken by certain drawers of sterling exchange in anticipation of their requirements. They seem to have apprehended that the Treasury might interpose some obstacles to their getting double-eagles, which are the only sort of coin that can be exported at a profit at the present rates of exchange. It should be stated that the Treasury has not exercised any arbitrary powers whatsoever in the premises, but has been administered upon the most enlightened principles. Business failures for the week are rather more numerous than during the preceding week, the figures being 237 against 218. The difference may be ascribed to the holiday which came in the previous week. General trade has been rather more sluggish than last week, but the best judges attribute the slackening to the extremely bad weather which has prevailed everywhere.

The bill reported by the Public Lands Committee of the House to forfeit all the lands of the Northern Pacific Railroad Company not earned prior to July 1, 1879, bears the evident marks of buncombe. It has been judicially established that in a case where a railway, endowed with a land grant, has failed of completion within the prescribed time, the grant continues good until Congress declares a forfeiture. The grant remaining in force, it follows that whatever might be done if the time

had not expired may still be done—that is, that the company may go on building and earning the lands and acquiring title thereto, and that the Executive departments of the Government must perform the same duties that they would have been obliged to perform if the time had not expired. These duties are merely clerical, consisting in the appointment of commissioners to examine the road from time to time, as new sections are built, and in the issue of certificates for the corresponding lands. The law provides that the certificates shall convey the title. It provides in some cases — we do not know whether the Northern Pacific case is one of them—that the title shall be conveyed in no other way. Land patents are not necessary to secure titles. It was shown conclusively, in the discussion of these questions two years ago, that the General Land Office and the Interior Department had strenuously resisted and opposed this interpretation of the law, and had sought to declare forfeitures on their own motion until overruled by the Supreme Court, since when they had followed the decisions of that tribunal as construed from time to time by the Attorney-General. It should be added that the Department has regularly brought all these facts to the attention of Congress, in order that forfeitures might be declared, if deemed requisite, by the only power in the Government capable of enforcing them.

Years have rolled on under this state of facts, and some sixty millions of dollars have been invested on the faith of the law and the decisions and the practice of the Government. The parties furnishing the bulk of the money are bondholders in no wise interested in the Northern Pacific as a speculation. The road has been completed as a through-line, and has thus far disappointed the expectations of the builders. Regarded as a money-making venture, it is not calculated to excite envy, and it may well be doubted whether any political party or any Congressman has anything to gain in the way of popularity by striking it when it is down. The preferred stock of the company, which was paid for in cash at par more than ten years ago, is now worth less than fifty cents on the dollar. Under such circumstances the bill to forfeit all the lands not earned prior to July 1, 1879 —that is, all lands not earned up to the time of the Jay Cooke failure, when work substantially ceased — cannot be esteemed either good law or good demagogy. Under the decisions of the Supreme Court its effect, if passed by Congress and approved by the President, would be merely to forfeit the lands flanking those portions of the line still uncompleted, viz., the Columbia River, Cascade, and Wisconsin branches.

The House Committee on Inter-State Commerce have seen fit to report a bill (much more reasonable, indeed, than the Reagan bill) which seeks to prohibit pools and combinations among railways. It has been sufficiently proved in the past, by the steady and almost unvarying decline in railway charges, especially on lines of traffic where the greatest amount of attention is given to the art of "pooling," that no such legislation is needed to bring about minimum rates for transportation—that is, the lowest rates consistent with cost of hauling, maintenance, and a moderate rate of interest on the capital actually invested. There is nothing more certain in the book of fate than that railway competition will yield the same harvest of low profits or no profits that competition in other trades has produced and always tends to produce —and this too, in spite of the best efforts of the ablest pool commissioners. When new capital comes crowding the market for investment its first impulse is toward railway building, because hitherto the largest fortunes have been made in that field. It looks about for some line of traffic where it is known or believed that "stock-watering" has been practised to an unwarrantable extent. It reasons that here must be a chance for profit because a new road can be built for much less than the nominal cost of the old one. The new road is built, it is taken into the pool, the profits of the combination are so reduced that cutting of rates begins, and the force of competition reasserts itself. But even if the pool can maintain itself and prevent rate-cutting, it will have learned by experience that it is only by doing business at the lowest rates possible that additional railways can be kept out and further and more disastrous competition prevented. The proposed legislation will probably prove futile when the attempt is made to enforce it. In the long run it will be found to be unnecessary, as regards its main purpose of securing the lowest attainable rates of transportation.

Mr. Henry C. Lea, of Philadelphia, in a letter to the *Tribune* published on Saturday, complains of Professor Lounsbury for failing to consider and discuss his suggestion that the Dorsheimer bill may be made satisfactory to everybody by embodying in it "the principle recognized in all copyright laws forbidding the importation of all books covered by copyright—*with the simple extension that no license shall be held to permit such importation.*" We have had no communication with Professor Lounsbury on the subject, but we think we can tell Mr. Lea why he refuses to discuss the suggestion, and this is because the principle to which Mr. Lea refers is intended to protect *authors*, and he proposes to pervert it so as to protect manufacturers. The author may now either allow or prevent the importation of foreign editions of his book, at his pleasure; the change proposed is to take away his right to make the choice, in the interest of the manufacturer; and this is what Mr. Lea calls *extending* the principle of copyright.

The old Tory squire who corresponds with the *Tribune* from London has evidently been thrown into a very nervous condition by the dynamite explosions. He says the language of the English press "shows signs of reaching the limits of patience," and that, "in private, Englishmen of known friendship are asking whether that country really means to persevere in giving refuge to Irish scoundrels and license to Irish crime until Europe, unjustly or justly, shall come to regard America as the Alsatia of Christendom." There is a want of clearness in this which is unworthy of a Justice of the Peace, which the writer probably is. He must know that "signs" that English newspapers are going to use strong language, are not likely to be alarming in America, where newspapers use strong language all the time, without any dynamite at all. The squire himself often gets to "the limits of patience" in his writing without rousing or frightening anybody. When his friends ask him, too, whether America is going to "persevere" in all those dreadful things, he should remind them that they are begging the question; that it has still to be proved that the country is "giving refuge to Irish scoundrels" and "license to Irish crime," in some other way than by gabble at dinner-tables. If they then persist in regarding America as "the Alsatia of Christendom," we would advise the squire simply to change the subject. An "Alsatia of Christendom" is something too dreadful to talk about long at a time.

No one disputes for a moment the general principle that it is the duty of our Government to prevent the use of its territory for the purpose of making attacks upon the Government or citizens of England; and it is not open to us, after the *Alabama* controversy, to put in as a defence that we have not laws which enable us to do this. If we have not, Congress has got to pass them, or else to take the consequences. This was the rule that we compelled England to adopt, and she paid us $15,500,000 for violating it. But the difficulty with dynamite raids is a purely practical one. In the case of an armed expedition, like a Fenian raid in Canada, or the fitting out of a Cuban privateer, overt acts have to be committed in this country. Men have to be enlisted, uniformed, equipped, fed, and paid; provisions, arms, and material have to be bought, and in the case of a ship she has to get out of port. When a plot of this sort is on foot, nothing is easier than for our Government to furnish evidence of what is doing, and if the evidence is sufficient, the ship's arms and materials can be seized, and the men locked up in jail. But in the case of dynamite no such process is possible. One man in a "hall bed-room" can hatch a plot to blow up the Queen and the whole royal family, which cannot be detected and which cannot be punished. To carry it out, all he has to do is to get a little can of nitroglycerine, sail for England, and watch his chance. No law here can prevent this. No overt act is committed here at all, and we cannot possibly be called upon to make it an international crime for an American citizen to purchase nitroglycerine for use against life and property in England. But if we were called upon, and if we did pass it, how could it be executed? It could not be carried into effect without the provision by Congress of a national system of inspection of the manufacture and sale of all explosives, and domiciliary searches for persons suspected of having explosives in their possession. Any attempt to enforce such a law would be at once contested in the courts on constitutional grounds by the persons whose business was affected by it, who would maintain that it

was an intrusion by Congress into the ordinary State jurisdiction over crimes against person and property.

The new Franchise Bill introduced by Mr. Gladstone will be better understood by recalling the statutes under which the present system of representation exists. The Reform Bill of 1832 admitted to the franchise all possessors of land of the annual value of £10, the owners of leases of sixty years of the annual rental value of £50, freeholders of the value of forty shillings, in counties, and the tenants of lands paying a rent of £50 per annum. But the owner of a freehold within a township was excluded from voting in the county in respect of the same property. In Scotland the franchise was actually the creation of the Reform Bill. Three classes were included: First, owners of property worth £10 per annum. Second, tenants on any of the old leases of "three nineteen years" who had a proprietary interest in a lease worth £10 per annum. Third, tenants in occupancy, paying a rent of £50 per annum, or who had paid a "grassum" or fine of £300 as consideration for the lease. In Ireland the two-pound franchise founded on occupancy was abolished, and in lieu of it the bill instituted a two-pound franchise, if supported by copyhold or other property, a ten-pound yearly interest on a lease of sixty years, or a twenty-pound lease of twenty years. From 1832 to 1867 no material change was made in the representation, but in that year Mr. Disraeli made his famous "leap in the dark." "That bill enfranchised in boroughs," says Mr. McCarthy, "all male householders rated for the relief of the poor, and all lodgers resident for one year paying not less than £10 a year rent; and in counties persons owning property of the clear annual rental of £5, and occupants of lands paying £12 a year." The bill introduced by Mr. Gladstone, on Thursday night, puts the three kingdoms on one footing. The £50 rating is abolished, and in place of it the lodger franchise is now extended to counties. An entirely new feature is the "service" franchise. Formerly laborers and agricultural servants residing in their employers' cottages and paying no rent were excluded from rating. These Mr. Gladstone for the first time brings within the English representation. It will be observed that the bill proceeds on the lines of former acts, cutting down existing limits, and introducing but few novelties beyond the "service franchise."

The policy of the English Ministry is, as was clearly foreshadowed by General Gordon, to hold the Red Sea coast, so as to stop the export of slaves to Arabia proper, which is the chief market for the African traders. For this purpose, the possession of Suakim, if not other ports, as well as a rigid maritime patrol, will be necessary. This, too, furnishes really the chief, if not the only, justification for the slaughter of the unfortunate Sudanese by General Graham. They have persisted in besetting the coast towns, which the British are determined to keep, and had been led by the triumph over the Egyptian troops to overestimate their strength. Apart from their desire to start the slave trade again, their cause is as good a one as has ever been defended in arms. They have been conquered and shamefully misgoverned by a worthless government, and one cannot help admiring the gallantry with which they have laid down their lives, and sympathizing in some degree with the feeling which dictated Sir Wilfrid Lawson's attack on the Ministry on Monday. The butchery of these poor spearmen was undoubtedly sorry work for Mr. Gladstone's Government, and yet —so true is it in politics, as well as in morals, that it is the beginnings which are dangerous —having taken Egypt in hand, there was no way of avoiding it.

The obstinacy of the Arab resistance to General Graham on Friday was of course largely due to ignorance of what the breech-loader can do in the hands of resolute and disciplined men. The Arabs were justified by their experience of the Egyptian troops in supposing that they could break the British square with spears and sabres. They had never until then encountered any other regulars. But the lesson they have now received will probably last them a good while. The fearful slaughter among them and the small loss on the British side show how little they amount to as a fighting force, and how absurd have been the fears that the Mahdi would lead them out of the Sudan to invade Egypt proper, or, as some have suggested, to overrun Europe. Even General Stone's recently expressed anxiety about the Bulak Museum at Cairo becomes, in the light of Friday's fight, somewhat comic reading. There is not the smallest reason to suppose that the Mahdi's own troops differ in any way from those of his lieutenant, Osman Digma. No fanaticism can make a naked body stop a rifle ball.

The workingmen of Lyons, France, have a representative in the Chamber of Deputies, M. Brialou, who has gone to the bottom of the protective tariff, and we commend his discovery to the committee of the iron and steel manufacturers and iron-ore producers who sent their remonstrance against the Morrison bill to the Committee of Ways and Means on Saturday. The reason why French labor is depressed, says M. Brialou, is because foreign labor is employed so extensively in France. Italians and Germans crowd the manufactories and besiege the doors of public works departments, offering to work for less wages than the French operative requires to maintain himself and his family in the scale of comfort and decency to which he is accustomed. The foreigners are taking the bread out of his mouth. M. Brialou is not an extremist. He does not ask that immigration be prohibited, but he thinks it is perfectly fair to demand that a law be passed prohibiting the employment of more than 10 per cent. of foreigners in the public works prosecuted by the state, or the departments or municipal corporations. As regards the manufactures carried on by the state, he would have foreigners excluded altogether. As regards private manufactures, he merely points out that foreigners are not only taking work out of French hands, but sending the money they get out of the country. Arguments very like these were heard in California in support of the Anti-Chinese Bill. Why they are not equally applicable to the Atlantic seaboard, we fail to perceive.

The German Liberals of every shade of opinion seem to be indignant over the action of Prince Bismarck in the Lasker matter, and the Executive Committee of the Liberal Union have signed an address of thanks to the House of Representatives in Washington for the passage of the resolution. Unfortunately, however, Bismarck is to remain in power, no matter what the Liberals think about him, and it is with him that our diplomatic intercourse has to be carried on. This raises the question of the expediency of keeping Mr Sargent at his post in Berlin. No one here questions the fidelity and efficiency with which he has discharged his duties, but ever since the State Department committed the very great indiscretion of publishing his despatch about the motives of the German hostility to American pork, he has been an object of dislike on the part of the ruling and official class in Berlin. This would not be of any consequence, or in fact would tell in his favor, if ambassadors were intended to be messengers of defiance, or semi-military vedettes. They are, however, meant to be messengers of peace and goodwill, who represent their country in its friendly and conciliatory attitude. When a minister's presence ceases for any cause, reasonable or unreasonable, to be grateful to the Government to which he is accredited, his usefulness is at an end, and he ought to be recalled. This is really the predicament in which Mr. Sargent stands. His presence is apparently an irritant to Bismarck and his set. This is very unfortunate, but there is no help for it, and there is only one remedy.

European Governments, which make diplomacy a regular branch of the public service, in which places are permanent, get over such difficulties very easily. When a Minister for any reason becomes obnoxious to the Government to which he is accredited, they transfer him to another post, and, if his conduct has met with their approval, to a better one than that which he leaves. They thus both vindicate and reward him, while putting an end to the difficulty which compelled his withdrawal. We are unfortunately unable to settle such cases in this way. When an American Minister gets into trouble, and has to be removed, no matter how blameless or praiseworthy his conduct may have been, he really has to be dismissed from the service. In other words, we have to inflict on him, if a poor man, a very heavy penalty. This naturally leads Ministers to whom the salary is of importance often to hold on to their places after their usefulness has ceased, and makes the State Department very slow to recall them, even "under fire." We say even under fire, because whatever might have been said for the old "fire" rule, under which so many unworthy persons were kept in office in President Grant's day in the home service of the Government, it is absolutely inapplicable to the diplomatic service, for the reasons we have already given.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, February 27, to TUESDAY, March 4, 1884, inclusive.]

DOMESTIC.

THE President sent to Congress on Friday the first report of the Civil Service Commissioners, accompanied by a message in which he said: "Upon the good results which that law has already accomplished, I congratulate Congress and the people, and I avow my conviction that it will henceforth prove to be of still more signal benefit to the public service. I heartily commend the zeal and fidelity of the Commissioners and their suggestions for further legislation, and I advise the making of such an appropriation as shall be adequate for their needs." The report, after reviewing the work of the Commission, concludes: "We cannot doubt that the most difficult stage is passed. But it will require some years of careful study and prudent adjustment to carry into full effect the practical methods authorized by the Civil-Service Act. The clerical force of the Commission, however, is inadequate. It has been worked beyond the customary hours of the departments. At least one additional clerk seems indispensable. In submitting this report it is proper for the Commission to declare that in every stage of its work it has had the constant and unwavering support of the President."

The President on Saturday transmitted to the House of Representatives the report of the commission appointed to examine into the condition of the swine product of this country. The Secretary of State, in a communication on the subject says, the report shows conclusively that hog cholera is not present in meat packed for human food, and in no event is the disease communicable to human beings. As to trichinosis the report is less conclusive, because less is certainly known of the manner in which the living trichinæ or their germs are transmitted. He advises further investigation on this point.

The House bill repealing the test oath was passed by the Senate on Wednesday, after being amended so that no person who held a commission in the United States army before the war and was afterward engaged in the military, naval, or civil service of the so-called Confederate States, shall be appointed to any position in the army or navy of the United States.

The Senate on Friday passed a bill to increase the navy, by a vote of 38 yeas to 13 nays. It authorizes the President to direct the construction of seven steel vessels, consisting of one cruiser of 4,500 tons displacement, one cruiser of 3,000 tons, one despatch vessel of 1,500 tons, two heavily-armed gunboats of 1,500 tons each, one light gunboat of 750 tons, and one gunboat not to exceed 900 tons; also, of one steel ram, one cruising torpedo-boat, and two harbor torpedo-boats.

The Senate on Monday passed bills appropriating more than $3,000,000 for public buildings in various cities.

The Senate Committee on Public Lands on Monday decided in favor of the forfeiture of the Texas-Pacific territorial land grant assigned to the Southern Pacific Railroad Company.

The House Committee on Public Lands on Wednesday voted to declare a forfeiture of all lands granted to the Northern Pacific Railroad, except as to that part of the road which was completed before July 4, 1879, and except all lands that have been patented to the road, and also lands which may have been occupied and improved by actual settlers.

At a meeting of the eight Democratic members of the Ways and Means Committee of the House on Thursday, it was unanimously agreed to report a substitute for the Morrison Tariff Bill. The substitute is identical with that bill, except that the free list is confined to salt, coal, and lumber.

The House Committee on Commerce, on Friday, agreed to an Inter-State Commerce Bill, the basis of which is the bill of Mr. Stewart, of Vermont. The chief changes are that the provisions of the Reagan bill which absolutely prohibit pooling and rebates are adopted.

Mr. Morrison, from the Ways and Means Committee, presented an important privileged resolution to the House on Wednesday. It called upon the Secretary of the Treasury to inform the House how much money there is in the Treasury; under what provisions of law it is retained, and how much, in view of existing liabilities, can be applied at this time to the payment of the public debt without embarrassment to the department. The resolution was adopted. It is undoubtedly intended to be used in connection with the tariff and refunding bills.

The Postal Appropriation Bill, as reported to the House by Mr. Randall's committee, appropriates only $45,261,000 of the $50,000,000 asked for by the Postmaster-General. It cuts down the estimate for letter-carriers and the free-delivery system by $200,000. The Postmaster-General asked for $12,750,000 for inland transportation. Mr. Randall's committee cuts it down to $11,700,000. This endangers the fast mail service in all parts of the country.

The German-American Congressmen presented the resolutions on the Lasker incident from the Liberal members of the German Parliament in the House on Wednesday, and, after a brief debate, which was more temperate than had been expected, the resolutions were referred unanimously to the Foreign Affairs Committee. The bill to prevent the spread of pleuro-pneumonia in cattle was passed by the House by a vote of 155 to 137.

The Hewitt-West incident has been passed over by the House without notice. The Foreign Affairs Committee reported on Wednesday that they had been unable to obtain any information upon the subject, and asked to be excused from a further investigation.

The Shipping Committee of the House, on Monday, by a vote of 7 to 3, authorized ex-Governor Dingley to report favorably the Pilotage Bill, which authorizes the master and mates of any American sailing vessel to be examined and licensed by the United States inspectors to pilot their own vessels.

By a vote of 227 to 46 the House decided on Monday that every person who served sixty days in the Mexican war should receive a pension of eight dollars a month.

A decision was rendered by the Supreme Court of the United States on Monday in the long pending legal-tender case of Juilliard vs. Greenman. The Court holds that the Legal-Tender Act of March 31, 1878, is valid and Constitutional, and that Treasury notes reissued under it are a good and legal tender in payment of all debts. Justice Gray gave the opinion.

The decrease of the public debt during February was $2,582,587.

Mr. W. H. Hunt, United States Minister to Russia, died in St. Petersburg on Wednesday. He was a native of South Carolina, but spent most of his life in Louisiana, where he rose to eminence as a lawyer. President Hayes appointed him one of the Judges of the Court of Claims, a position which he held when called to President Garfield's Cabinet as Secretary of the Navy. When President Arthur reorganized his Cabinet, Mr. Hunt was sent to Russia as Minister to succeed Mr. Foster. Public funeral services were held in St. Petersburg on Tuesday. The body will eventually be brought to this country.

The New York Republican State Committee met in this city on Tuesday, and decided that the State Convention should be called to meet at Utica on April 23. A resolution was passed recommending that the district delegates to the next Republican National Convention be elected by conventions in the respective Congressional districts.

Governor Cleveland on Monday morning signed the Comstock bill prohibiting the making of further contracts for the labor of convicts in the State's prisons and penitentiaries of this State. He returned to the Assembly that evening the bill extending the time of the Howe Prison Commission, with a message giving reasons why the bill did not receive his signature.

The Finance Committee of the State Senate on Wednesday recommended an appropriation of $1,000,000 for work on the State Capitol at Albany for the ensuing year.

In the Assembly the bill making it mandatory upon local authorities to carry out the provisions of the State Civil-Service law was reported favorably from the Cities Committee. It was made a special order for Tuesday. The bill making a reduction of twenty-five per cent. on the present pilotage fees was passed—ayes, 82; noes, 21.

The proposed amendment to the Constitution of the State, prohibiting the manufacture and sale of spirituous and intoxicating liquors, was rejected by the Assembly on Thursday by a vote of 61 to 63. Eight Democrats voted with the Republicans in the affirmative, and seventeen Republicans with the Democrats in the negative.

The Roosevelt bill, taking the confirming power from the Aldermen of this city, was favorably reported by the Senate Committee on Thursday by a vote of 6 to 1.

In the Assembly on Tuesday Mr. Roosevelt unexpectedly received a two-thirds vote in favor of making the High-License Bill a special order for one week from next Thursday. The prospect for the passage of the bill is, however, not promising.

The time for holding the New Jersey Republican State Convention at Trenton has been changed to April 17.

The New Jersey Assembly destroyed on Wednesday the efficacy of the Civil Rights Bill passed by the Senate several weeks ago, by striking out the specifications of hotels, restaurants, and theatres as places in which colored persons should enjoy the same privileges as white persons, and by reducing the penalties for violation of the law to such small sums that a colored person would hardly take the trouble to bring suit for them.

The Faculty at Amherst College have voted not to endorse the resolutions on inter-collegiate athletics.

John Guy Vassar has given $10,000 for the benefit of the cabinets of physical and chemical apparatus in the Vassar Brothers' laboratory at Vassar College.

Mrs. Mary Brown, widow of John Brown, the abolitionist, died on Friday in San Francisco. She was married to him in 1833, when in her eighteenth year.

Governor Richard D. Hubbard, of Connecticut, died in Hartford on Thursday morning. He was born in 1818 and was graduated from Yale College in 1839. Adopting the profession of law, he gained distinction in it, and for twenty years was State Attorney for Hartford County. He was elected to Congress in 1867, and was made Governor of Connecticut by the Democrats in 1876. During the war he was a stanch Unionist, and his views on civil-service reform and other public questions of the present day have been such as to command the respect of both political parties.

The chemical works of Powers & Weightman, in Philadelphia, the largest in the country, were burned early on Friday morning. The loss was more than $1,000,000, on which there was an insurance of about $500,000. The firm were manufacturers of large quantities of quinine, the wholesale price of which was affected by the fire.

A fire in Utica, on Sunday, destroyed property valued at about $1,000,000. The Utica City

National Bank and the *Observer* office were among the buildings destroyed.

FOREIGN.

The advance of the English troops on Teb began on Wednesday. Two hundred and fifty men were left to garrison Trinkitat, and a force of about 3,900 men advanced to the attack. On Thursday night the expedition encamped near Fort Baker. On Friday morning the troops advanced to battle. The forces were formed in an oblong square. The Gordon Highlanders in line formed the advance, with two Gatling guns and one Gardiner in the right corner, and two Gardiners and one Gatling in the left corner. The Eighty-ninth Regiment in line formed the right-hand side of the square, the Black Watch Regiment the rear. The length of the front was 350 yards. The rebels in swarms occupied the high ground in front and on the flanks of the British army. They retired slowly, as the English advanced, keeping within about 1,200 yards of the main body of the English forces. After an advance of three miles had been made the earthworks of the rebels came in sight, and the British troops advanced to within 800 yards of the position. The rebels opened the battle with a shell from a Krupp gun and followed it up with a fulisade from small arms. Baker Pasha was wounded in the face by a piece of shell and twenty British were hit. They kept on their advance, and at noon opened fire with guns and rifles. The rebel fire slackened, and the British advanced upon the works. The defenders held their position desperately, and charged upon the British with their spears, but fell in great numbers, and the line sullenly retired. Having cleared the ground in front, the British attacked Fort Burnaby, and carried it after a desperate fight, the Arabs contesting every inch. The British then stormed a brick building, and at 1 o'clock the rebels bolted, the Gatling guns and Martini rifles creating great havoc among them. The English forces advanced to the fresh-water well at Teb, where the rebels made their last stand. After four hours of arduous fighting the British gained possession of the rebels' camp. The cavalry charged the slowly retreating rebels. General Graham decided to pass the night at the Teb Wells. The losses were: about 2,000 rebels killed, 24 British killed, and 142 wounded.

The British troops entered Tokar at noon on Saturday. A few shots were exchanged with the enemy, when the 4,000 rebels holding the town fled. The garrison numbered seventy men who were half starved. The remainder had joined the rebels. Osman Digma is encamped near Suakim. A battle with him is expected when the British troops return to Suakim from Tokar. General Graham will have the troops embark at Trinkitat and return to Suakim, as the latter place is the best base for operations against Osman Digma. General Graham, leaving a battalion to garrison Fort Baker, will order the troops to embark on Thursday. The operations against Osman Digma will not extend beyond Tamanieb.

The London *Times* on Monday asserted that General Graham had been ordered to retreat immediately from Tokar, and to arrange for the return of the British troops to England and Egypt. Earl Granville, Foreign Secretary, positively denied the rumor in the House of Lords. His statement was received with loud cheers.

A lively scene occurred in the House of Commons on Monday afternoon. Questions were put to the Government regarding the condition of affairs in Egypt which the Government refused to answer, whereupon great excitement arose. Sir Wilfrid Lawson, Radical, moved that the House adjourn in order to discuss the Sudan problem. He made a violent attack upon the Government, charging it with cowardice, blood-guiltiness, butchery, and Jingoism. The motion was rejected by a vote of 103 to 105.

The Egyptian Government, feeling convinced that General Gordon's mission would fail, offered on Sunday to Abd-el-Kader Pasha, Minister of War, under the sanction of Sir Evelyn Baring, the British Minister, the Governorship of Khartum. Abd-el-Kader Pasha refused to accept the office, however, unless General Gordon should assent.

General Gordon's latest proclamation to the inhabitants of the Sudan asserts that, as he has done everything possible to insure quietness and stop bloodshed, and his advice has not been followed, he has been compelled to summon British troops who will punish them. The proclamation caused a sensation at Cairo on Friday when it was made public. No demand for British troops had reached there. Later advices indicated that El Mahdi had received with delight Gordon's offers, and had ordered a cessation of fighting.

In the House of Commons on Thursday night Mr. Gladstone introduced a bill for the extension of the franchise. Important additions result from making the £10 occupancy of dwelling houses include land and gardens at, that rental, without any buildings, and without actual residence there. It enfranchises residents who neither own property nor pay rent, but who work on the land, such as laborers, gardeners, game-keepers, watchmen, etc., residing in cottages on the employer's property. It abolishes the old £50 county occupancy franchise, and reduces the rating franchise from £12, where it was left by the Disraeli reform bill, to £10. It also extends the lodger franchise from boroughs to counties. It does not deal with the redistribution of Parliamentary seats.

Mr. Gladstone, in his speech on the bill, said, to introduce separate franchise bills for England, Ireland, and Scotland, with a prospect of carrying the English and Scotch bills and leaving the Irish bill to take its chances, would be altogether impracticable. The arguments in favor of a uniform bill were unanswerable. Nothing could induce him to abandon such a bill. Redistribution of the Parliamentary constituencies must follow the reform of the franchise. But if the two questions were embodied in the same bill, it would prove fatal to both. The measure would increase the voting power of the United Kingdom by about 2,000,000. Of this number England would furnish 300,000, Ireland 400,000, and Scotland 200,000. After some remarks in opposition the debate was adjourned. The Parnellites and the Scotch members appear generally well pleased with the bill. The English Liberals are disposed to object to extension of franchise unless coupled with redistribution, on the ground that it will strengthen Ireland and Scotland at the expense of England.

Mr. Gladstone has agreed to the creation of a new Minister with a seat in the Cabinet, to be called the Secretary for Scotland.

An infernal machine, containing twenty pounds of dynamite and a clock-work attachment for firing it, was found at Charing Cross Railway Station, England, on Thursday. The machine had failed to explode at the time for which it was set. The clock-works were of American make. Another infernal machine of American manufacture was found at Paddington Railway Station on the same day. The discoveries created great excitement in England, and extra police precautions were immediately taken. Parnellites in the House of Commons, on Thursday, denounced the dynamite campaign as no part of their programme. On Saturday a black bag made of American cloth was found in the cloak-room of the Ludgate Hill Station, containing about forty packages of dynamite and a portion of an American alarm clock. Four men who arrived in England from America on Feb. 20 are believed to be the guilty conspirators.

The London *Times* appeared with a leader on Friday in which it said: "It is intolerable that England should be exposed to this succession of plots from a nation which professes to be friendly with us and with which we have only a desire to live in peace and amity. We know that the Americans are aware of the identity of the plotters of these outrages. It would be no hard task for the American Government to end the whole thing. We shall do our utmost to guard ourselves. It remains for America to aid us, as she alone can nip the mischief; but our demand is one which a civilized nation is bound not to disregard." Later in the day it was announced that the English Government had decided to send a courteous despatch to America relative to the action of Americans in countenancing and assisting dynamiters.

The London newspapers on Wednesday referred indignantly to the explosion at the Victoria Railway Station as a further evidence of Fenian cowardice. The *Times* said: "The leaders of the Land League will do well to exert their influence with the dynamiters to repress outrages, since the British, however long-suffering, will not indefinitely permit the murder of innocent persons."

The Paris police are convinced that the advanced Irish party have made Paris their headquarters in Europe for the preparation of their dynamite schemes. The Nationalist colony includes representatives of the three centres of the Irish Republican Brotherhood. The first section comprises former Fenians, James Stephens, John O'Leary, and General MacAdaras. The police have traced the arrival of five men belonging to the third or active section—the dynamiters—who have been told off for the next attempts. They came from Buffalo, Paterson, Brooklyn, and two from Texas. They are believed to be pupils of Mezeroff.

The French Government has decided to expel from France all suspected dynamiters.

Henry Irving denies that he will be a candidate for Parliament.

Prof. Goldwin Smith denies the report that he has been offered the Professorship of History at Oxford by Mr. Gladstone.

Salvini made his reappearance at Covent Garden, London, on Thursday night, in the character of *Othello*. He showed undiminished powers, and met with a warm reception.

Isaac Todhunter, the well-known English mathematician, is dead. He was senior wrangler at Cambridge in 1848, and in time became professor at that University. He was the author of many works on the higher mathematics.

The bust of Longfellow was unveiled in Westminster Abbey on Saturday. The Sub-Dean of Westminster performed the ceremony. Earl Granville and Minister Lowell made speeches.

Miss Nevada, the American prima donna who has made such a success in Paris, has become a convert to the Roman Catholic faith. She will soon receive the rite of baptism at the English Passionist Church in Paris. M. Gounod, the composer, will be one of the sponsors.

The Emperor William of Germany gave a state banquet on Wednesday night in Berlin in honor of the Special Russian Embassy and the Grand Duke Michael. He made a very friendly response to the toast in honor of the Czar.

Christian August Selmer, Minister of State for Norway, was on Wednesday found guilty under articles of impeachment, and sentenced to forfeit his official positions and pay a fine of about $5,000.

General Iglesias took the oath of office as Provisional President of Peru in the Assembly at Lima on Saturday. The Cabinet have resigned.

DYNAMITE PROPOSALS.

THE English press continues to discuss actively the nature of the dynamite grievance, but the discussion does not make the matter much clearer. The nearest approach to a practical suggestion is that Congress might pass a law making conspiracies to injure life and property in foreign cities a highly penal offence. Assuming that Congress has the power to pass such a law, the difficulties in the way of its enforcement would be so great that the law would be, after its passage, so much waste paper. A conspiracy is a matter proverbially difficult to prove in a court of justice, and, of course, the passage of such a law would render evidence far harder to get than it now appears; for the dynamiters like Rossa, who now go about breathing forth fire and slaughter, would keep very quiet, while the work would still go on; so England would really, in the enforcement of her own laws, be cut off from a good deal of American evidence now contributed gratis to her police and prosecuting officers through the dynamite press here.

The English press obviously forgets that the spectacle of the extreme difficulty their own government finds in preventing Irish agrarian and political crime, is not such as to encourage ours to think that we can, at a distance of three thousand miles, do much to help them. They have had to change their whole system of trying crimes of this sort, to authorize the arrest and imprisonment of persons on mere suspicion, to take away the most cherished and ancient legal rights, merely to secure life and property within the jurisdiction of their own courts. To expect a foreign Government, however friendly, to do anything of this kind is ridiculous. But the task which the English press would like to impose upon us is far harder than that of the English Government. It involves, first, legislation, and then the enforcement of legislation against crimes hatched here to be committed abroad. We might have to work for several years before we could get a single conviction; and indeed the lesson taught us by England is that we could not probably accomplish anything at all without suspending the habeas corpus, and taking away the prisoner's right to trial by jury. This is what the English demand for legislation comes to if it means anything at all.

The suggestion that we might by a vigorous inspection of explosives here prevent the introduction of dynamite into England is also gravely brought forward. Here, again, we are asked to do work which it is the duty of England to do, and which England alone can do. The place to prevent the introduction of dynamite into England is the English custom-houses, where any human being who lands can be searched and every box and satchel can be examined. It is no part of our duty to search everybody who leaves the United States to see whether they may not have something in their possession of which they may make an improper use abroad. If it were, we might be just as well asked to prevent "Number Ones" from leaving our ports with knives and pistols as to prevent dynamiters. International law is founded on common sense, and does not require such absurdities.

The Irish-American population are all more or less in the position of refugees, driven out of their own country by bad government at home, and the right of asylum really involves the right to hatch plots and make threats. If the dynamiters were real refugees, every one would see this at once, but we cannot be expected to be more severe with them merely because they are, unfortunately, in many cases, American citizens, as well as a branch of a race governed by England. If it were fair to ask such a thing, even expelling an avowed dynamiter would only leave ten unavowed dynamiters in his place. It is the strong, silent dynamiter who really endangers life and property, not the loud-mouthed ranter who urges him on. But in the last resort, our answer to England must be, How are we to *prevent* here crimes against life and property which are committed in England, in the face of the enormous difficulties which you find in the task of detecting criminals who actually commit them?

THE MAIN OBSTACLE TO PRISON REFORM.

THE meeting of prison managers and reformers on Wednesday week at the Fifth Avenue Hotel led to a discussion of a great variety of topics connected with prison reform, all of which in themselves are of interest and importance. They were, however, so numerous as to give the report of what took place a bewildering effect. If those who have taken the matter up wish to accomplish anything practical, they evidently need to confine their attention pretty closely to one or two points, and make the public understand what is wanted. The question, for instance, as to the effect of wearing "stripes" on the self-respect of convicts (a disciplinary detail), or that of the "indefinite sentence," which involves a complete change in our whole theory of punishment, are not matters about which the public is asked or expected to do anything just now, nor are they matters about which the reformers are agreed. Even the prison-labor question, important as it is, is not a question of the reform of an admitted prison abuse, pure and simple, but is complicated with political considerations and the demands of the non-convict laborer for protection.

One point was brought up, however, as to which there is little, we think we may say no, difference of opinion among prison reformers. It relates to an abuse which is not local, but extends all over the United States, which has existed for a hundred years, on which prison reform has had thus far no effect worth mentioning, and yet which admits of a simple remedy. This is the connection of the Sheriff with the common jail. The condition of the common jail all over the country is perfectly well known. It is the institution to which offenders, young and old, of both sexes, are sent at the beginning of their criminal career, where they are herded together, given nothing to do, made more callous and vicious and criminal. The city jail, the county jail, the Eastern jail, the Western jail, are all much alike. In this State, for instance, the latest report of the Prison Association gives the following account of the discipline in these institutions. The jails mentioned are taken at random from the report. In Albany County there is no separation of prisoners of different classes, and as to hard labor the report is "no work." Cayuga County has a "filthy jail;" criminals of all conditions are "mixed together," "without restraint or watch." Chenango County—"Sanitary condition and ventilation bad." As to prisoners, there are "no particular rules." All these three prisons are reported as being "unsafe" in one way or another; the danger from fire, which is a peculiar feature of all the county jails, being mitigated only by the facilities for escape which the condition of the building offers. In Cattaraugus County the prisoners are not kept separate, nor are they required to work except by the Sheriff "in his garden." The Sheriff suggests that "it would be better if a regular jailor could be employed to watch the prisoners constantly," the deputy placed by him in charge of them "having other business outside." In Chemung County there is no separation, and no work. In Columbia it is "easy to break out," which seems fortunate, as there is "no ventilation whatever." Prisoners are "not asked to work." The Dutchess County Jail has "but little ventilation," "no distinction" between different classes of prisoners, and "no labor whatever." In the Kings County Jail, which we believe is frequently presented by the Grand Jury, there is, or was recently, a little collection of instruments of torture—a "yoke," four "rawhides" well worn, and two "paddles." None of these, it is unnecessary to say, are recognized by the Revised Statutes as legitimate instruments of discipline. And so on from one end of the State to the other.

This picture of the New York jail, it appears from the discussion last week, is a fair representation of the jail everywhere. No such state of affairs exists in the State prisons of this or other States. In them, though they may be capable of much improvement, the convicts are kept hard at work, are classified and separated, and are not allowed to associate with each other in such a way as to make it probable that the effect of their imprisonment will be to make them worse instead of better when they return to society.

The explanation of the difference between the jail and the State-prison system lies on the surface. A hundred years ago all prisons were in the condition that our jails are now. They were sinks of filth and iniquity and cruelty, and schools of crime. They were reformed by the Legislature's adopting the system of prison discipline shown by the example of early prison reformers to be the true one, and making it uniform throughout the State. So far has this been carried in this State that we have put all the prisons under one man, who is solely responsible for them.

Nothing of the sort has ever been done with the jails at all. They have been left in the hands of a petty local politician, chosen at a popular election, and chosen not because he has the slightest interest in the care or reformation of criminals, but because he is a good "worker" for one or the other party. His business is to make a living out of his jail; and, as his prisoners do not vote, and have little to say in the press or at public meetings, he is giv-

en no trouble by anybody. The first step in prison reform is, as has been urged repeatedly by prison reformers, to take the jails out of the hands of the Sheriff and put them into those of the State. This is a single point which can readily be made plain to the comprehension of the public; and if the prison reformers will make it so they may do a great deal of good. The Sheriffs, it is needless to say, are totally opposed to any change.

LIQUOR GOVERNMENT.

THERE is one consideration, not directly connected with the Roosevelt Aldermanic Bill, now before the State Senate, but having an important bearing on it, which may be seriously commended to the attention of a good many people who care but little about the difficulties of municipal government. That consideration is the rapid growth, not in this country only, but all over the world, of the opinion that the next great step in amelioration of the condition of the race must be the destruction or great diminution of the manufacture and sale of spirituous liquors. We are not now talking of the state of mind of fanatical temperance advocates or prohibitionists. We mean that the increased attention which is being given to the problems of crime and poverty, and which finds expression in attempts to improve the dwellings of the poor, to make their lives less dreary and the future of their children more hopeful, to protect women and children from brutality and fraud, to make prison discipline more wholesome and reformatory, brings the most conscientious and influential members of every community face to face with the fact that spirituous liquors—that is, whiskey, brandy, rum, and gin—are by far the greatest cause of preventable human misery. In Switzerland there is a loud call for governmental action, and one which will be promptly answered, if it has not been already answered, to prevent the disorder and misery resulting from the recent rapid increase in the consumption of spirits. In Belgium and Norway the same question is coming up from the same cause. In Great Britain "the enthusiasm of humanity" is very distinctly taking the same direction. In fact, no matter from what point social reformers start, they are all apt to meet round the whiskey or brandy cask, as the true source of most of the woe they are combating.

In this country we are to-day met by the grave fact that the quantity of distilled spirits in the United States in October last was 115,949,235 gallons, of which the United States was taking care of 74,582,117 gallons in bond until the owners could find it convenient to pay the tax on it. The amount of human misery, the murders, the fires, the suicides, the defalcations, the loss of property and health, the divorces, the family shame and sorrow, stored up in this amount of liquor is simply incalculable. In fact, it is not too much to say that every whiskey warehouse is like a little volcano, ready at a moment's warning to send little rivulets of flame and desolation over the country. No one needs distilled spirit except in sickness. Nobody in health drinks it with his meals as a cheering or digestive beverage. It is probably never taken by a healthy man without more or less physical or moral damage. In other words, it is a huge national curse. The number of people who begin to see this is increasing, and they are likely every year to become a greater and greater proportion of the American people. Now, it would be wise for those who are interested in either the manufacture or sale of liquor not to foster the growth of this sentiment by any exhibitions of their strength which are not necessary to the protection of their business. Not only the distillers but the brewers would do well to take note of this. One of these exhibitions which is increasing public hostility is the apparent determination of the liquor interest to take charge of the government of American cities. In all the large cities the liquor-dealers have of late years made strenuous efforts to seize and administer, or take a large share in administering, the revenues. They have long been an almost preponderating influence in the government of this city. There are seven liquor-dealers in the Board of Aldermen in New York, or nearly one-third of the whole number, and, as they act together, they practically control the Board.

Now, the American people will not stand this much longer. The liquor-dealers probably cannot be got out of politics until they are attacked in their saloons, and public sentiment is perhaps not yet ripe for the closing of the saloons. But there is a decided readiness to diminish their number and exercise more stringent supervision over those which are kept open. But no feature of municipal government is likely to be tolerated much longer which is found inpractice to result in giving the retailers of whiskey a large share in managing the affairs of civilized communities. The makers and lovers of whiskey, rum, gin, and brandy would do well, therefore, to let the Aldermen go. The less prominent they are, and the less they have to say about government, the better for the liquor interest.

THE MANNERS AND MORALS OF ENGLISH SOCIETY.

LORD EUSTACE G. CECIL has been writing a very dismal article in the last number of the new Tory monthly, the *National Review*, on what he calls "Social Deterioration" in England. His charges are, that manners have sadly fallen off in the House of Commons; that politicians on the stump are disgracefully abusive; that in society "adventurers of every description, male and female, find their way into and are freely encouraged in the best company, because they happen to be preëminently rich, or good-looking, or unscrupulous." The rest of the passage is worth quoting:

"No matter what their previous history may have been, no matter how vicious their conduct or how coarse their manners, if they are wealthy they are courted; if they are clever or pretty they are invited. They even find their way to court balls, and at every great fête of the season they are abundantly represented. Everybody remembers how a famous French actress, still living, was received in town a few years ago. Although her character was notorious in Paris, the honor of receiving her was disputed by those whom the newspapers would call the *élite* of London society, and she became the rage from Belgrave Square to Pall Mall. American influences are, perhaps, to some extent responsible for the exhibition of such predilections, but there are patent signs elsewhere that bad taste has been imported from other than transatlantic quarters. What the sale of so-called society papers may be, may be known to those who care to inquire; but that it has greatly increased is clear from the number of those papers that have started into existence in the last few years. The scandal-mongering traffic is no longer a trade, it is a profession, and evidently a remunerative one. The private lives and secrets of the most distinguished and the most notorious personages are frequently sold by their professed friends for a paltry consideration to newspaper editors, who increase the sale of their wares at the expense of victims, who are unwilling, if not powerless, to retaliate. Scurrilous books and articles have been constantly written since the invention of printing, and occasionally, no doubt, private malice has been satisfied by the publication of some indecent scandal or grosser libel; but it has been left to the nineteenth century to erect the art of slandering into a profession, and, by making the practice remunerative, to do its best to perpetuate the evil. Surely no better evidence could be adduced of the decline of right feeling than the existence of a temper of this kind in the public mind."

In seeking to account for the decline of formality in the intercourse between men, he says:

"For how much of this lack of manners the other sex are responsible it would, perhaps, be ungallant to say. Young ladies are to be found who frequent the smoking-room, do not object to smoke cigarettes, and are not ashamed to adopt the slang they hear there. Indelicate plays are no longer a bar to the presence of unmarried girls, and newspapers containing full details of the Divorce Court are to be seen as well in the boudoir as in the drawing-room. It has been argued that to forbid these things is simply prudery, that to the pure all things are pure, and that the knowledge of good and evil are intended to be as much the curse of the one sex as of the other. But this argument really rests upon the new Democratic gospel, that all men, women, and children are equal, and that the privileges of the one age or sex are the rights of all; a mode of reasoning which leads straight to that anarchy in respect of all creed, opinion, and usage, which is to be the millennium of Advanced Radicalism."

What is most curious in the article is the fact that the writer ascribes everything he deplores to such vague generalities as "American influence" and "Advanced Radicalism," and steadily avoids what everybody who has observed English social phenomena during the past twenty, and particularly the past fifteen years, knows well to be the true proximate cause. In discussing social tendencies, there is not much use in troubling one's self about human depravity in general and man's love of wealth and pleasure. These have existed everywhere and always. The philosophic way of getting at the root of the difficulty is to ask whether any agency capable of producing this demoralization has been at work in England during the past fifteen years, which was not at work during the previous fifteen. The answer must be that there has, and that it consists in a Court largely given up to amusement. Nothing is more familiar to the readers of social history than the influence of such a court on manners. The state of things in England since 1870 is no worse or

more puzzling than the state of things in France between 1853 and 1870. The same causes produced precisely the same effects. When the Empire was overthrown, the pleasure-loving class of all countries transferred themselves to London, simply because the person who had there become the head of society was a pleasure-loving man.

Probably there has in our day been no one equally highly placed who takes life less seriously than the Prince of Wales. This fact is a little disguised by his kindliness and good nature, and the assiduity with which he performs those ceremonial duties of inaugurating public works, laying foundation stones, and unveiling statues, in which Englishmen so much delight in seeing royal personages engaged. But it is none the less notorious that he has really set to a wealthy society the fashion of treating amusement as the chief end of man, as something which all who can afford it are entitled to get by any means not involving cruelty or direct dishonesty. We say direct dishonesty, because there is no doubt that a certain section of English society to-day does not scruple to get its pleasure through encouraging dishonesty, or, in other words, by receiving with open arms any well-mannered knave or reprobate who is able to make it laugh. There have been, as is well known, many cases of late in which the Prince of Wales's attention has been called to the unfitness of foreigners for some of the social attentions he was bestowing on them, owing to their unfortunate antecedents, but he has refused to treat these antecedents as any disqualification for his company. This is really all there is in Lord Eustace Cecil's mysterious allusions to the "famous French actress" and "American influences." Both French and American adventurers, no matter how low their reputations at home, find in London a ready market for their songs, their good stories, their good card-playing; the Americans, of course, the readier of the two, because they have the language and a new kind of humor. It would be too much to expect society in general to be more particular than its head, or to make wry faces over what he swallows without winking. To ascribe in any degree to "American influences," therefore, English social *défaillances*, which good Americans witness with mingled wonder and indignation, is really a little too bad; and to expect the reprobates of American society not to go to the only city in which they find a cordial welcome, is asking too much of these droll and amiable creatures.

What is most needed for English social reformation is a Court which takes life seriously, and does some hard work. As long as the English reverence for royalty exists, the Court must be the most powerful influence on the manners and morals of the wealthy class. That "modern Radicalism" can compete with it sounds very like a joke. There is probably nothing which moulds morals more rapidly than the example of those we admire or envy. The capacity of courtiers for imitation is one of the commonplaces of history, and nearly every man or woman in England in our day, who has over £1,000 a year, is a courtier; and a very large number, when they begin to feel the rays of Court splendor, rapidly get into the way of thinking that to be "jolly" while you may is the true rule of life, and of feeling deep gratitude to the man or woman who kills time for them pleasantly. They are not responsible for his frauds, or his debts, or her slips and misdeeds, or shabby career, they think; and the songs, and mots, and ways of putting things of both of them are *so* delightful.

VITROLLES AND THE BOURBON RESTORATION.—II.

PARIS, February 14.

WHILE M. de Vitrolles was making frantic efforts in favor of the Bourbons, among the Kings and Emperors of the Coalition and their ministers, France hardly knew who these Bourbons were or where they were. M. de Vitrolles himself had much to learn on this subject. At Nancy he instructed Monsieur (the Comte d'Artois) concerning the principal political personages of France, and Monsieur instructed him concerning his own family. The King lived quietly at Hartwell, like a landlord; the Queen was dead, and the Countess of Narbonne, who became afterward the Duchess of Narbonne, was the object of the attentions and of the preference of the King. The Duke of Angoulême and Madame lived also at Hartwell. The Comte d'Artois and the Duc de Berry lived in London; the latter had been captivated by an English lady. In his exile, the King had kept up all the appearances of a court: he had two captains of his guard (though he had no guard), the Duc de Gramont and the Duc d'Havré; gentlemen of the chamber, viz.: the Dukes of Fleury, of Aumont, of Duras. Moreover, he had a favorite, the Comte d'Avaray, who had helped him to escape from France at the time of the flight to Varennes. The King had made D'Avaray duke immediately after the death of Louis XVI. D'Avaray became consumptive, and was obliged to go to Italy, where he met M. de Blacas, of an old house of Provence, who was a poor *émigré*, and whom he took back with him to the little court at Hartwell. After the death of D'Avaray (he died on the island of Madeira), M. de Blacas became the factotum of the King, and a favorite in his turn. The King was very gouty, and could not walk. When M. de Vitrolles heard of this, he was horrified. "What! the King cannot walk? At least he can ride?" "No," said Monsieur. "Good God! what will become of us? Well! we must ride for him." He remembered the words of Burke, speaking of the King: "He must not think of sleeping on velvet cushions. . . . He must go through his provinces—be always on horseback; he must add to the rights of legitimacy all the qualities necessary to an usurper." What were the plans of the King? what was his programme? M. de Vitrolles asked many questions on this subject. Surely, he thought, the King must have meditated on the political situation of France during the tedious days of his long exile; he must have found some way of reconciling old France and new France. The Comte d'Artois could give him but little information; he did not much like the name of "States-General." "Have the States-General not brought us to a subversive National Assembly and to a regicide Convention? The clergy is a highly respectable body, but why should it have a political existence? The parliaments have always been a nuisance and an impediment! The provincial assemblies were an invention of Turgot and Necker." Such were the remarks made to M. de Vitrolles when he offered any suggestion. He soon found that the Princes had no plan, no programme, no system. They claimed France as a proprietor claims his domain. They meant to be good, to be just, but they knew no more about the art of government than the unfortunate Louis XVI.; at any rate, Monsieur seemed to avoid all general discussions—he cared only for men, and was insatiable of details as to all persons.

A battle had been fought on the 31st of March at Arcis-sur-Aube, and Napoleon, instead of going back to Paris, had attacked the enemy's lines of communication, and thrown himself on Saint-Dizier, in the hope of drawing to himself the garrisons of Lorraine and Alsace. Monsieur was still at Nancy. He gave letters to Vitrolles, accrediting him with the allied sovereigns in the name of the King. He was instructed to negotiate for the recognition of Louis XVIII. and for immediate peace. Monsieur gave him also a copy of the letters-patent which bestowed on himself the title and powers of Lieutenant-General of the kingdom in the absence of the King, a nomination in blank of a Governor of Paris, and several commissions in blank for generals. The intention of Monsieur was to give the governorship of Paris to Talleyrand. With these important documents, M. de Vitrolles started for Paris in a carriage with Baron Weissenburg, an aide-de-camp of Prince Paul of Würtemberg, who commanded a division of reserve in the Russian army. They were unknown to each other. They had an escort of Bavarian soldiers. Their carriage was followed by several others, containing officers who were on their way to the headquarters of the allies. The little caravan was arrested in a village by peasants armed with guns and sticks. All the prisoners, with a new escort of Frenchmen, were conducted to Chaumont. M. de Vitrolles, during the journey, had time to destroy all the papers which had been confided to him; if they had been seized by the French officers who cross-examined all the prisoners at Chaumont, he would probably have been shot as a spy. He gave himself out as the servant of Baron Weissenburg, who had shown him much kindness on their dangerous journey, and even helped him to destroy all his papers. It was decided that Weissenburg and all the other officers should be sent to Saint-Dizier, where Napoleon was; as for the servants, they were left behind, and taken from prison to prison. Vitrolles succeeded in making his escape and in going back to Paris. His journey was a true Odyssey, and all his friends thought him lost. Nesselrode said to Dalberg, who inquired for him: "We do not know what has become of him, but we owe it to him that we are here."

Vitrolles had been absent, thrown in the shade, during the preliminaries of the Restoration. He learned on his return that the Duc d'Angoulême had been received at Bordeaux with acclamations; that Paris had not risen at the appeal of the supporters of Napoleon. Talleyrand had not followed the Empress Regentess or the Council of Regency to Blois; he had played a little comedy, and had been arrested at the barrier of Paris by men whom he had himself paid, when he was apparently going to join Marie Louise. Under the presidency of Talleyrand, the Senate had appointed a provisional government. He did not wish to throw himself at the feet of the Bourbons; he wanted to treat with them and to obtain a Constitution. He used all his influence in order to win over to his views the Emperor Alexander, who had arrived in Paris. Alexander was still reticent, and had not yet pronounced the names of the Bourbons. All was still in suspense. Napoleon was at Fontainebleau, collecting the remains of his army, white cockades were showing themselves, but no solution was certain.

Vitrolles had been thus far an instrument of Talleyrand. He went to see him, and was well received, and complimented on his lucky escape from so many dangers. He was taken to the apartments of the Emperor Alexander, who was staying in his hotel in the Rue Saint-Florentin. "Well," said the Emperor, "do you think that our conversation had results enough?" amiably alluding to their first conference. Talleyrand, when he was again alone with Vitrolles, put him many questions as to the Comte d'Artois. They dined with the Emperor. Alexander looked embarrassed. He listened to the eulogy of Monsieur by Vitrolles, but said nothing. He had not made up his mind; he was alone, separated from the Emperor of Austria; he enjoyed the applause of the Parisians; he was popular; he thought himself the king of kings. Vitrolles hoped that the immediate arrival of Monsieur in Paris was a necessity; it would make the balance turn. But in what character would he come—as representative of a King who was not yet recognized? or at the call of the Provisional Government? In what uniform? with what cockade? These questions preoccupied Talleyrand. He was anxious to find a *trait-d'union* between the Senate and the Bourbons, a link between the men of the Revolution and the *émigrés*. He thought of himself, he thought also of France; he wished to make his weight felt; he wished also to find a new basis for the ancient dynasty. His views were undoubtedly those of a statesman; the views of Vitrolles were those of a partisan. The first was the most intelligent, the second the most loyal. The struggle which began between these two men is the same which has continued since the French Revolution, and which has not ended yet.

The Emperor Alexander was honestly trying to find out the real sentiments of France. He was placed between Talleyrand, who was really in his own person the whole Provisional Government, and the Senate, which was composed of men who thought only of saving their own situation. The marshals abandoned the cause of Napoleon, one by one; all the great bodies of the state asked for the return of the legitimate monarchy. Sieyès, the maker of constitutions; Carnot, the member of the Comité de Salut Public; Barras, Garat, and others, pronounced for a solution which seemed the last resource of France. The return of Monsieur to Paris was decided. Napoleon, feeling himself abandoned, and hearing of the adhesion of Ney, of Macdonald, of Cambacérès, of the Duc de Vicence to the Provisional Government, signed his abdication at Fontainebleau. Vitrolles was sent to Nancy, in order to bring back Monsieur to Paris. His carriage was full of royalist pamphlets, which he scattered on his way. He was the only traveller who had been seen for a long time, and he confesses that the passport given to him by Prince Volkonski, the Chief of Staff of the Allied Armies, was more useful to him than the passport of a Provisional Government which nobody knew. "Is the Emperor dead?" was the universal question. "Does Paris still exist? has it been burned and sacked?" Nobody would believe that all was quiet in Paris. The traces of war were visible everywhere. Vitrolles promised peace to all whom he met—"peace and the Bourbons." "The end which I announced was new, unexpected, and seemed uncertain. Nobody dared to give himself up to his natural impressions; they all feared to be mistaken—deplorable result of the Revolution, which has taught the most open and expansive people to conceal its sentiments and to conform them to the dominant opinion."

Monsieur was not pleased by the news brought by Vitrolles. He was anxious, however, not to act completely at the dictation of the Emperor Alexander, and he sent for M. de Bombelles, the Minister of Austria, and informed him of the situation. He left the next day for Paris. Vitrolles had brought for him the uniform of the National Guard; the Prince consented to make his entrance into Paris in this popular uniform. Before leaving Nancy, the Comte d'Artois appointed M. de Damas "governor of the province of Lorraine and of the three bishoprics (Toul, Verdun, Metz)"; he did not even know the names of the departments and returned naturally to the old denominations. Meanwhile, the Senate had framed a Constitution, in great haste the Corps Législatif had assented to it, Napoleon had accepted the Island of Elba. The Senators pronounced themselves irremovable, changed themselves into Peers of the Kingdom, and called voluntarily (*librement*) to the throne of France Stanislas Xavier, brother of the last King. Talleyrand had succeeded, and Vitrolles was very indignant. The entrance of Monsieur was a real triumph, but Vitrolles never forgave Talleyrand: he had dreamed of something else than a bargain between his Princes and the Senators of Napoleon. Men, women kissed the knees of Monsieur, kissed his boots, his horse. "What I saw," says he, "happened in the presence of 500,000 witnesses. Many have forgotten it, so much so that they do not believe any more in what they have seen, in what they have felt."

Correspondence.

GENERAL OVERPRODUCTION.

To the Editor of The Nation:

Sir: In a communication from "U. H. C." (dated Feb. 9), in regard to the cause of the present depression in business, he discredits the theory of "special overproduction" which has as a remedy the "redistribution of employments," because it involves, seemingly, a condition which is wholly at variance with existing facts. To argue that if, having produced what is not wanted, you subsequently turn around and produce what is wanted, all will go well again, implies, he says, that "certain wants and demands are now unsatisfied and unsupplied, not because of the *lack of means to purchase*, but because of the *scarcity of the thing to be purchased*." On the contrary, either of these facts can be the cause of certain wants and desires remaining unsupplied. If the scarcity of certain things desired does not actually exist, still the lack of means to purchase can exist, and prevents the want from being satisfied. Thus if A produces iron not wanted by B and C, who produce respectively wheat and coal for each other and for A, then it must follow that A's demand for wheat and coal must remain unsupplied if B and C do not want his iron: and for this cause rather than because wheat and coal are scarce. From now on, B and C will only produce enough wheat and coal for themselves alone, unless A can discover something to produce which they desire and cannot now obtain. In the absence of this, A is still in need of wheat and coal, to obtain which he must change his employment, giving up the production of iron and taking up either of the others. In this case A's wants are unsupplied because he lacks the right means of purchase. An exchange cannot be made unless the parties to it desire each the articles possessed by the other.

What is the difficulty in harmonizing these statements with facts? All commodities—iron, cloths, grain, and the like—seem to exist now in abundance, and is not this abundance another name for "general overproduction"? As long as there are men in want of the necessaries for sustaining life, these necessaries cannot be said to have been overproduced. The laborers out of employment, the capitalists receiving no return for their investments, *have been* engaged in producing an amount of certain commodities *the ratio* of which to the amount of other commodities is too great. We have to-day too many factories, furnaces, and railroads in proportion to the food we produce. The Fall River strikers and the community would both be better off had the strikers been engaged in agriculture for the past year rather than in manufacturing. Corn and wheat are both more nutritious than cotton cloth.

To rectify the present state of affairs will probably take considerable time, as the redistribution of employments and investments is not the work of a day. The change also involves considerable friction. B. J. S.

Cincinnati, February 26, 1884.

THE SINS OF THE REVIEWS.

To the Editor of The Nation:

Sir: Might not the critic of the *Saturday Review* who writes so genially on "Anglo-French and Franco-English," find a most appropriate—nay, a perpetual—text in the French of the *Westminster Review*? If any of your readers care for the most delightful specimens of the "French of Stratford-atte-Bow" satirized some hundreds of years ago by Chaucer, just turn over the leaves of the October number of this famous review and quote *ad infinitum* for their delectation. Here you will find in the article on Henry Gréville's and Lord Ronald Gower's Reminiscences such "Gallicism" as would disgrace the school exercises of our primary academies; such orthography and grammar as may be found in an unmodernized Montaigne, or in an Englishman's Franco-English diary; such idiom as has never been heard except in the precincts of Westminster.

Is it not a shame that the review of John Stuart Mill and George Eliot should not do better? and is it not worse still that the *Saturday Review* should point its moral and adorn its tale not with the lingo of Paternoster Row, but with the harmless jargon of "a far Western hotel"? J. A. H.

Lexington, Va., February 23, 1884.

To the Editor of The Nation:

Sir: The *Edinburgh Review* for October, 1883 (p. 295), in speaking of Sedgwick's attack on the heights back of Fredericksburg in May, 1863, says: "He ascended these blood-stained heights, then held by only a couple of slender battalions, numbering 800 men, who were eventually made prisoners, at a cost of 1,000 killed and wounded." This is a grave error. The heights were held by about 8,500 rebels. Early himself, in a communication to the Richmond *Whig*, said he was there with his own division and Barksdale's brigade, and a battery. In all he says he had seven brigades. Doubleday places the number at 9,000. The Committee on the Conduct of the War, after hearing all the testimony, called it 10,000. Barksdale's entire brigade first held the particular part of the heights known as Mary's Hill, and before the attack Early sent Hay's brigade to support him at this point; while the other brigades were close at hand and were attacked at the same time. The 18th and 21st Mississippi regiments were captured almost intact. In all, over 1,000 men were taken, besides the killed and wounded, showing how absurd must be a statement that Sedgwick was confronted by only two battalions of 800 men. In five minutes he lost in killed and wounded nearly 1,000 men, which could not have been the work of 800 men on the other side.

I call attention to this because I have before seen so many underestimates and misstatements about this battle. W. S. N.

SALEM, February 27, 1884.

THE SITE OF TROY.

TO THE EDITOR OF THE NATION:

SIR: Your review of Dr. Schliemann's new book proves one thing clearly, that any literary criticism of the Doctor's theory and work is necessarily futile. I believe that if, from the literary standpoint, there was any chance to prove or disprove the assumption made in 'Troja' as to the Schliemannian theory of Ilion, your reviewer would have done one or the other. What he does prove is, that no literary criticism can touch the heart of the question. Every argument by which in his view the identity of Ilion with Hissarlik is shown, tells with just the same force in favor of an hypothesis of the identity of the Hissarlik town with that founded by Crœsus, which is, according to Strabo, the first historic foundation on the site of the Novum Ilium. Start with the theory that this Lydian city was what Schliemann was looking for, and every argument thus far is as applicable as to Homer's Ilium. I believe that Professor Jebb, in the 'Hellenic Studies' and *Fortnightly*, has done all that can be done from the literary point of view, and that his conclusion that Homer's topography was eclectic is that which is most clearly shown to be the most probable, looking at the matter in the light of all the literary evidence we possess.

What Dr. Schliemann says of "the Lydian city"—"all that I am able to show of this city is its pottery; there is no wall of defence, nor even any house walls, which I could with any probability attribute to it"—shows that that city was not in any probability the Lydian city built by Crœsus, which was most unlikely to have been without walls and important buildings. On the contrary, it is more likely to have been so provided than Ilium itself; and what is the most significant item in the evidence—the use of bricks in the walls—is, from the purely archæological point of view, a proof conclusive, so far as our present knowledge goes, that this city was not Homer's Troy, and was the town of Crœsus; for bricks are unknown in the whole series of heroic cities: there is not a single case known of the employment of bricks in the epoch at which Troy must have been built if it be the city of our poetic traditions.

The real demonstration of this question remains purely archæological, and no *authority* in archæology has pronounced in favor of Dr. Schliemann's theories. Dörpfeld and Höfler are not archæologists, Sayce is an Assyriologist; and all archæologists at Athens know that Schliemann's education and judgment in archæological matters are absolutely *nul*. He has not a scientific fibre in his brain, with all his enthusiasm and devotion to antiquity. A great deal has been said about Dr. Schliemann's "intuition," but we need not forget that he proved the first Troy quite as much to his satisfaction as the second; that his "intuition" led him first to excavate on Bunarbashi before Hissarlik, and that years ago he examined Mykenæ carefully and pronounced excavations there futile. He has perpetrated more blunders in purely archæological matters than are permitted to a tyro, while his knowledge of Greek may be guessed at from his explaining, in the preface of 'Troja,' that a friend had called his attention to the fact that in translating the passage describing the Trojans assaulting the Greek camp, he had made them attacking their own wall instead of that made to defend the camp.

To Dr. Schliemann every fact which goes to confirm his theory is good, every one opposed is of no weight. He sees, and has always seen, what he wants to see. The fact is that he has no conception of the value of a scientific discovery, or conscience in his statement of what he has found; and so he states as fact what is his mere conjecture (*vide* Comparetti's report to the Lincei on an Ithacan inscription transcribed by Schliemann). The battle about Troy will wage many years more unless it is concluded by an archæological demonstration. Bunarbashi must be as thoroughly excavated as Hissarlik has been. Excavations on the plain are also possibly necessary, and behind the whole controversy lies the possible solution that the Trojan war was a myth.

I have studied the construction of prehistoric and historic walls for twenty years, and may claim a right to pronounce an opinion on such matters; and I do not hesitate in offering one, viz.: that the construction of the wall which Dr. Schliemann describes as that of the Troy of Homer cannot be placed further back than the Lydian dynasty. W. J. STILLMAN.

THE POSTAL NOTE.

TO THE EDITOR OF THE NATION:

SIR: If every one should voice his dissatisfaction with the new postal note, it would be speedily discontinued or amended. To contribute my share to that end, allow me to call attention to one disadvantage of the note which I have not seen mentioned. Postmasters frequently make them out on offices that are not money-order offices. I have received three such notes within as many months. There is no remedy but to return the note to the issuing office, or to the sender, which involves a double risk, a long delay and an extra charge.

I believe the country would welcome a limited issue of fractional currency, large enough to facilitate the mailing of small sums, such as are included in the limitations of the postal note. Or else let the notes be made payable at *any* office. Wherever the office is so small as to receive very few orders, the trouble of meeting them would be correspondingly light; and any office that would use many of them is large enough to meet the heavier demand.

H. H. BALLARD.

Notes.

FUNK & WAGNALLS announce as in preparation 'The Fortunes of Rachel,' by the Rev. E. E. Hale, and 'Prince Saroni's Wife,' by Julian Hawthorne.

Thomas Whittaker will shortly publish American editions of 'The Authority of Scripture,' by the Rev. R. A. Redford; and of 'Characteristics of Christianity,' by Dr. Stanley Leathes, Prebendary of St. Paul's.

The promised 'Biography of the Hon. Ezra Cornell,' by his eldest son, ex-Governor A. B. Cornell, will be issued by A. S. Barnes & Co. on April 1.

Jansen, McClurg & Co., Chicago, have nearly ready the fourth volume in the series of translations of Topelius's "Surgeon's Stories," namely, 'The Times of Frederick I.'

Chas. Scribner's Sons will begin publishing this month a collection of "Stories by American Authors"—the most noteworthy *short* stories contributed during the last ten to twenty-five years to our periodicals. The quality of these, we apprehend, will rank very fairly with that of any of their class. A large number have been the productions of women.

The second volume in the new and uniform edition of the works of the late Dean Stanley, now publishing by Charles Scribner's Sons, is his 'Lectures on the History of the Jewish Church' (vol. i.). Besides maps and plans it contains a beautiful steel portrait of the Dean.

A new edition of the 'Works of Alfred Lord Tennyson, Poet Laureate,' has just been issued at a popular price in one volume, 12mo, by Macmillan & Co. It contains a few poems which have been withheld from similar collections for half a century—*i. e.*, since their first printing in 1833. Tennyson has, we are told, corrected the present edition throughout; and having done so much it is a pity he did not affix a date to every piece, if only in the table of contents. This particular service is one which poets ought to feel bound to render posterity, because they can do it most easily. As in the work last mentioned, there is an admirable steel portrait of the author.

The Franklin Square Library, No. 366, is Queen Victoria's 'More Leaves from the Journal of a Life in the Highlands—1862-1882,' a curious psychological study. "A thick, misty, very threatening morning" was Monday, Oct. 9, 1865. "There was no help for it, but it was sadly provoking. It was the same once or twice in former happy days, and my dear Albert always said we could not alter it, but must leave it as it was, and make the best of it." Friday, Sept. 12, 1873, on the contrary, was "a most beautiful bright sunshiny day. . . . At eleven drove to and through *Fort William*, . . . passing the celebrated *Ben Nevis Distillery*, which is two miles from here, and . . . by an old, very neglected graveyard, to the right, in which is an obelisk to McLachlan, a poet, and past the *Belford Hospital*, a neat building, built by a Mr. and Mrs. Belford."

We are glad to receive from the *Forest and Stream* Publishing Co. a second edition of Judge Caton's 'Antelope and Deer of America,' a study in natural history of a kind much too rare not to be welcomed again and again. The work is plentifully illustrated, and is most interesting reading.

A fair book of about three hundred pages, entitled 'The Adventures and Discourses of Captain John Smith,' comes to us from the press of Cassell & Co. It is the story of the founder of Virginia, as gathered from the printed works of that accomplished hero, and "newly ordered" by John Ashton, author of 'Social Life in the Reign of Queen Anne,' etc. In this shape the narrative is presented as if related by Captain Smith himself to a group of listening children, and very welcome it will be to English-reading children everywhere, for, as an American biographer has written, "Poetry has imagined nothing more stirring and romantic than his (Smith's) life and adventures, and History upon her ample page has recorded few more honorable and spotless names." The engravings contained in Mr. Ashton's book are barely tolerable facsimiles of those found in Smith's 'True Travels, Adventures, and Observations' (London, 1629) and his 'General History of Virginia, New-England, and the Summer Isles' (London, 1627), and are very much inferior to those in the Richmond edition of these works, printed in 1819 at the expense of John Randolph of Roanoke.

Fords, Howard & Hulbert have made a neat pamphlet of Mr. Beecher's commemorative discourse on the late Wendell Phillips, adding a passable woodcut likeness of the great orator.

Mr. Wm. H. Tillinghast, of the Harvard Library (as we learn from the January *Bulletin*), has undertaken "an index to maps contained in geographical periodicals, collections of voyages, and other extensive works of a geographical nature to be found either in the University

Library or in the larger libraries of Boston." This has already been done for the *Bulletin de la Société de Géographie* of Paris, and begun for the *Annales des Voyages* and the *Nouvelles Annales*.

A paper touching the duel between Burr and Hamilton, and the relations to it of Rufus King, as the friend of the latter, is the most significant contribution to the current *Magazine of American History*. Mr. King's opposition to and dissuasion from the duel seem established beyond doubt.

In the February *Shakespeariana* Mr. F. G. Fleay adduces evidence of allusions to Shakspere's plays in Marston's, and finds, for example, confirmation of his own conjecture that "Troilus and Cressida" dates back in its earliest form to 1598-99. Mr. J. Parker Norris, continuing his interesting papers on "The Portraits of Shakspere," discusses the famous death-mask, in the authenticity of which he is disposed to believe.

On April 15 J. H. Chambers & Co., St. Louis, will issue the first number of a monthly *American Journal of Ophthalmology*, edited by A. Alt, M.D.

The *Art Amateur* for March comes with a freight of designs of all kinds, *e. g.*, capital process illustrations of the Water Color Exhibition, and a delicate "process" of that most indelicate nude statue, Power's "Greek Slave"—a work which has so little of any of the great qualities of sculpture, or of any very remarkable quality except that of utter and conscious nudity, that it is scarcely creditable to the taste of the day that five replicas of it are in existence. Some spicy and relevant editorial comments are made on the Mackay-Meissonier broil—which, by the way, promises to develop into a social feud—and there is a notice of the Brooklyn Loan Exhibition, by Clarence Cook.

De Gubernatis's new *Revue Internationale* (Trübner) has a chapter from a work by Tullo Massarani on Charles Blanc and his work, here entitled "La critique d'art depuis Diderot," and of which the most just and intelligent part is that which is devoted to a really great and learned art critic, Théophile Gautier. As for Charles Blanc, his highest merit is that he knew how to use appreciatingly and edit cleverly the ideas of people who knew art better than he, but not always without gross blunders which showed that he was not *au fond* a true critic. When he ventured alone he fell. There is no vertebral uprightness in his work, no real integrity in his system; he was a master of phrase-mosaic, little else. To write a book on what he wrote is necessarily waste of words, whether it be to praise or blame.

Frederick Keppel & Co. send us the etching by A. J. Martial from the "Cancalaises," by Feyen Perrin—a charming work, to which incidental allusion was made in our review of the Etching Club. The subject is the annual festival of the people of Cancale (where are the great oyster beds of that district on the coast of France) to which on one day in the year all the Cancalaises are allowed access, with the privilege of taking as many oysters as they can carry away. It happens during the autumnal low tides, and as the rise and fall of the tide is very great, an enormous expanse of shallow water lies between the seaward limit of the beds and the shore, through which, coming back from their quest, the multitude of Cancalaises are marching towards the spectator on dry land. The rich ladies of the Cancale sometimes avail themselves of the privilege, and this will serve to explain why in the front of the long line of fisher people walk two who are evidently too delicately bred to be peasants or fishwives, and the refinement of whose faces has been the special study of the etcher. The etching is, in all the best qualities of the art, the finest large plate which has come under our notice. The exquisite delicacy of the distance of sky; the faintly marked sails of the fishing boats on the open sea; the breadth of the masses; and the extreme tenderness of all the gradations, from the artistically placed black of one of the leading figures out to the far-away stragglers just inside the surf—are the result of a firm and painstaking use of the needle, which our young etchers ought to be glad to see and proud to imitate. The recent death of the etcher makes the examples of his work the more valuable. The study of the three leading figures will teach a beginner in etching more of the art than a year's etching out of his own head.

Mr. James Clephan, of Newcastle-on-Tyne, reprints from the *Archæologia Eliana* a pleasantly discursive paper on "Some Old Forms of Law," in which he passes in review the ancient customs respecting the wager of battle, the *peine forte et dure*, and the repressive laws against the gypsies, taking as his text various incidents in the history of the Palatinate of Durham. Of course, in the compass of twelve pages no exhaustive treatment is possible, but the pamphlet contains several curious anecdotes well worth preservation. The fortitude with which Anthony Arrowsmith in 1597 submitted to the horrors of being pressed to death, in order to avoid the forfeiture of his estate and transmit it to his children, might well serve as the groundwork of an historical novel, if historical novels were not out of fashion; and even the admirers of Mr. Froude might question his admiration for the wholesome rigor of Tudor legislation, when tested by the hanging in 1592 of five "Egyptians," simply for the crime of being gypsies, under statutes which were not repealed until 1783.

There comes to us, from the Chilian Department of Commercial Statistics, a large and handsome volume pertaining to the year 1882, in which a marked gain is exhibited over the transactions of the preceding year. While Valparaiso, as the metropolis, is credited with four-ninths of the foreign commerce, the port of Iquique, one of the four acquired by annexation during the late war, stands for one-seventh, and the other three together for about one-sixth. An ironical feature of our American dealing with a nation whose commerce we aim to cripple by our tariff, is the fact that five-sixths of the timber for ship-building in Chili comes from the United States.

The report on the trade between the United States and Mexico, just elicited from the Bureau of Statistics by a resolution of the House of Representatives, is accompanied by a map of Mexico, colored to show the differences of elevation, and indicating also the lines of transportation between the two countries—finished and projected. The appendix is very full of information.

— Mr. Irving's visit furnishes a topic to two magazines this month—the *Atlantic* having an article on him by Mr. Henry A. Clapp, the *Century* another by Mr. J. Ranken Towse. Both critics take fundamentally the same view of Mr. Irving—that he is not an actor of the first rank, and that his intellectual conception of the parts he plays is far better than his actual delineation of them. One difficulty in arriving at a just estimate of Mr. Irving's powers arises, as in the case of most distinguished actors, from a lack of agreement as to the facts on which criticism is based. Mr. Clapp dwells at some length upon the "peculiarities of his delivery," and thus attempts to convey to the reader an idea of what they are:

"His oddities of utterance are no more English than they are Choctaw; sometimes they suggest Cornwall, sometimes Devonshire, occasionally Northern Vermont. But such hints are given by fits and starts; the dialect is always substantially his own—an Irving *patois*, developed out of his own throat and brain through the operation of the familiar law of the survival of the unfittest. An alternate swallowing and double-edging of consonants, a constant lapse into an impure, nasal quality, an exclusion of nearly all chest tones, the misdelivery of the vowels by improper prolongation or equally improper abbreviation, an astonishing habit of confounding and confusing different vowel sounds, are the most marked of his disagreeable peculiarities. The great broad vowels are the ones which fare the worst in Mr. Irving's mouth, and the reform of his delivery must therefore be regarded as hopeless: an actor of middle age whose chief pronunciations of 'face' are fāāāce and fēāāce, and of 'no' are nāo and nawo, is past praying for in this regard."

Now, we did not ourselves see Mr. Irving in many parts, but his *patois* must necessarily be substantially the same in all, and we heard nothing in it more than may be heard in any cultivated Englishman's speech, colored by a very bad stage rant and drawl, which it appeared to us he had affected for the purpose of artificial invigoration. The result is peculiar, undoubtedly, but not nearly so peculiar as the delicacy of ear which enables Mr. Clapp to detect Choctaw, Cornwall, Devonshire, and even Northern Vermont in his tones. A partisan of Mr. Irving might feel disposed, after reading this article, to raise the not irrelevant question of what Mr. Clapp's own method of speaking English may be. The fact is, that unless we know this, we are not in a position to determine how well the critic can judge of Mr. Irving's departure from recognized standards. It should, at least, be said in Mr. Irving's behalf, that actors' English pronunciation of the present day, at least in this country, is not so good as to make us dread very much the effect of his example: most of them mouth, some rant, almost all betray want of early cultivation. On the other hand, if they all pronounced perfectly well, the effect would be probably very depressing, for the people who come to hear them are by no means purists in this matter.

— Mr. Towse goes into Irving's principal parts in considerable detail, and his criticism has a great deal of permanent value. A hundred years hence it will enable a theatre-goer, not exactly to compare Irving with the star who may be playing *Matthias* or *Shylock* then, but to get an idea of what our age looked upon with respect and sympathy in the representation of such parts. Mr. Towse directs the attention of his audience to a point continually neglected in modern theatrical criticism, that the main question to be determined is how well the actor delineates human passion—not how he dresses, nor how much the scenery or curtain costs. In all his parts Mr. Irving is tried candidly, and found wanting in the capacity to represent the emotion or passion of the character accurately, or indeed so as to arouse the correlated sympathetic illusion in the audience. He keeps it—or leaves it—cold. In *Matthias* Mr. Towse finds the illusion "never quite complete, and the attention of the spectators is sustained not by engrossing interest in the fate of the mimic personage, but by admiration of the executive skill displayed by the performer." In *Charles I.*, where passion was needed, "there was no ring of honest feeling in his voice; no suggestion of heartfelt impulse in his gesture, which was conventional, stilted, and unimpressive." In *Louis XI.* there is "no manifestation of passion." In *Shylock*, "there was not one single note of true passion, or one touch of genuine pathos, while the lines were often made almost unintelligible by the vilest of elocutionary tricks." Without going any further into detail, this may be said to be a fair sample of Mr. Towse's criti-

cisms on this point, and it will be perceived that they throw a most important light on the question of Mr. Irving's rank as an actor. For those who take the view of the dramatic art on which they are based—and it was until within a generation the only view that any one took—Mr. Irving's great reputation will have to be rested on different grounds from those which support the fame of Garrick, or Edmund Kean, or Mrs. Siddons, or Salvini. The one essential thing for a great actor he has not. Many things not essential—a keen eye for the picturesque and a great faculty for management—he has; but he is, after all, a labored actor, and the spark of genius has been denied him.

—*Lippincott's* has a good illustrated article on "The Berlin of To-day," by Anna Maynard Butler, which contains a passage of some interest with reference to the education of women:

"In the education of girls, Berlin has always shown deep interest. Perhaps the decided strides onward in this direction taken during the present reign are due to the thorough culture and love of study possessed by the Empress Augusta. Certain it is that several of the best *Stifte*, or institutes for girls, have the patronage and untiring interest of the Empress to thank for their prosperity. Far on as American women are supposed to be in matters of study, I venture to say that the German girl is better grounded, better drilled, and far more logically taught than they. She is undoubtedly less able to make use of her knowledge, seldom does make the most of it, and upon her entrance into society is *womanish* rather than *womanly*; nevertheless, the fact remains indisputable that until her seventeenth year her education is based upon a system thorough, progressive, comprehensive, which, if pursued until the age of twenty-one, would make the women of the upper classes of her country the best-instructed women of our time."

Any one who has ever seen an American girl subjected to the German process of education must have been surprised to find how much real drilling and discipline a girl will take without injury. The thing in which American girls exceed all others is not knowledge or accuracy, but social readiness and adaptability. This comes, of course, from their early habit of taking care of themselves, and sometimes of their socially helpless parents; and also from their being thrown from their earliest years into the society of the opposite sex in a familiar and pleasant way. They enjoy, if not co-education, at least co-recreation, almost from the beginning of their lives.

—*Harper's* has an illustrated article by Mr. T. W. Higginson on "The Early American Presidents," in which he dwells upon the fact, often noticed by writers who have taken up this period, that French influence had very little effect upon American politics till a good while after the Government was founded. It was in its origin and nature English, and our Frenchmen, though living at the time, did not show their hand till later. But the reason that they did not do so is plain. It was the French who caught the contagion of our example, and went far beyond anything that we dreamed of, and it was not until they had brought a good deal of odium upon liberty, fraternity, and equality, that Jefferson and his followers, demagogues as they were (though, no doubt, as Mr. Higginson says, reformers too), re-echoed their wild talk on this side of the Atlantic. That sane Americans should ever have dreaded the establishment of an American aristocracy seems now incredible enough, but they really did. The frontispiece of *Harper's* shows that Mr. Abbey is in danger of acquiring some of the English vices of illustration. It resembles the weak and careless work which certain eminent painters are in the habit of sending to English illustrated magazines. His second full-page illustration is scarcely better. The Yorkshire coast illustrations are excellent, especially the "Early Morning at Whitby." The portrait of John Adams, cut by Kruell, is an admirable piece of work—one recognizes the textures of Stuart in the engraving. The cuts for "Nature's Serial Story" are in their way delightful both as design and engraving. The article on "Domestic Decoration" is too prescriptive and arbitrary, in its attempt to lay down rules, to be generally very useful. It is absurd, for instance, to say that "the most universally [generally?] recognized rule for determining the height of a room is the sum of half the width and the square root of the length"! But the proportions of any room depend on the uses of it and the general disposition of the house and style of architecture. There can be no such rule admitted by an architect of originality. "To make a room appear *wider* is accomplished to a certain extent by making it appear lower, but when this is undesirable, etc., the effect can be reached by adopting a mural decoration on a graduated scale of form decreasing upward, etc." But this is to effect precisely the contrary: this graduated scale adds to the apparent height of the room, and so, by the author's rule, must diminish the width.

—The second (March) number of the *Foreign Eclectic*, which, like its predecessor, shows good taste in its selections from French and German periodicals, reprints from *L'Univers Illustré* a fine poem by Paul Déroulède, "Le Clairon," which irresistibly recalls Freiligrath's equally fine "Die Trompete von Gravelotte." The two patriotic effusions challenge comparison by their points of resemblance as well as of contrast, whether accidental or not. Freiligrath's verses, which have found a permanent place in German literature, relate a true and simple episode of the Franco-German war. After a dearly bought victory a trumpeter, ordered to give the signal for rest, finds his trumpet pierced by a ball, and the sound which it gives forth seems like a wail of sorrow over the fallen:

"Nur ein klanglos Wimmern, ein Schrei voll Schmerz
Entquoll dem metallenen Munde;
Eine Kugel hatte durchlöchert ihr Erz—
Um die Todten klagte die wunde!"

In Déroulède's poem the trumpeter himself is struck, but with his dying breath he still sounds defiantly the bugle:

"Il est là, couché sur l'herbe,
Dédaignant, blessé superbe,
Tout espoir et tout secours;
Et sur sa lèvre sanglante,
Gardant sa trompette ardente,
Il sonne, il sonne toujours."

It were easy to draw from these two poems a lesson in what is termed the "comparative psychology of nations," did not German sadness in victory and French defiance in defeat, as here interpreted, strike alike a common human chord.

—We congratulate the Bostonian Society on its first publication—'Abel Bowen, Engraver,' a sketch by William H. Whitmore. The collector of local guide books prizes few above the second edition of 'Bowen's Picture of Boston,' published in 1833. This volume, admirable for its contents, was illustrated by a large number of steel plates, mostly containing four views each of the principal buildings of the city. These views are remarkable for their delicacy and fidelity, and are among the most precious and authentic memorials of the edifices delineated. A portion of them, together with several of Bowen's woodcuts, including a portrait of himself, having been acquired for the cabinets of the Bostonian Society, the occasion seemed a proper one for rescuing a highly-deserving name from oblivion. Mr. Whitmore has discharged his task with characteristic accuracy and particularity, and his little brochure is adorned with impressions from all the cuts and plates referred to. One of the larger woodcuts (that on p. 23), faithfully copied after the English engraver Thompson, was selected by Mr. Linton, in his 'History of Wood-Engraving in America,' as a sample of Bowen's singular skill in such reproductions. Mr. Whitmore shows that this artist was the real founder of wood-engraving in Boston. In March, 1834, he became one of the incorporators of the Boston Bewick Company, "for the purpose of employing, improving, and extending the art of engraving, polytyping, embossing, and printing." Bowen was also one of the first to experiment with lithography after its introduction. His services in connection with Snow's 'History of Boston,' and with other works commemorating his adopted city, were worthy of a native. He was in fact born near Greenbush, N. Y. We cannot conceive of anything better calculated to attract support to the Bostonian Society than a series of antiquarian publications like this, of which the get-up is simple and inexpensive.

—Several causes have delayed mention, on our part, of the initial volume of the Archives of Maryland, as undertaken to be published by the Historical Society of that State, by authority of the Legislature and at the public charge. The Society is now the custodian of the recovered archives, for which it has built a fire-proof receptacle; and the invaluable assistance of its librarian, Mr. J. W. M. Lee, has been freely given to the editor, Dr. William Hand Browne, librarian of the Johns Hopkins University, for the making of as creditable a reproduction of colonial records as any State can show. The first volume is a fine quarto of nearly 600 pages, and is entirely devoted to the Proceedings and Acts of the General Assembly of Maryland from January, 1637-38, to September, 1664. Such gaps as existed in the archives for this period were happily nearly all made good from duplicate documents found in the London Public Record Office, where, too, much else relating to Maryland was found and copied, and will duly see the light. A calendar of the archives, so far as these are in volumes, is here printed by way of preface. The utmost scrupulousness has been observed in transcribing literally, with the single exception that the abbreviation for *the* has been disregarded. There are four indexes—of bills read, and passed; of persons and places; of miscellaneous business—the last not sufficiently analytical, surely, and not to be compared with the topical indexes, say, of the Boston Record Commissioners. In all other respects, the execution of this task merits unqualified praise.

—What strikes one, in running through this body of early legislation, is the temporary character of it—a large part being enacted only until the next Assembly should meet, and having to be renewed from time to time. In extreme cases, as in the punishment of swearing, a term of three years seemed allowable. One advantage of this renewal of old statutes was the opportunity of improving them under better enlightenment. Thus, nothing gave more trouble during the period under consideration than the condition of white servants or apprentices, especially their bad habit of running away. The first "act against fugitives," passed in August, 1641, denounced their action as felony, punishable with death or servitude. After one or more renewals, in April, 1649, nothing but fine and doubling of time of service was exacted. Punishments were not peculiarly barbarous. The first case of flight and theft by a servant dealt with by the Assembly showed a majority favorable to John Richardson's being

whipped three several times, but "Mr. Greene to be hanged; Mr. Giles Brent to be whipd very severely; Mr. Fulk Siliter [similiter]; The Captain: to be whipped provided that he be Sorrowful for his fault; The President: to be laid in Irons and whipped three several times very severely." For treason, it was proposed that a man should be hung and quartered, a woman drawn and burnt. Acts of September-October, 1663, provide for erecting a pillory, stocks, and ducking-stool in every county of the province, and furnishing irons for burning malefactors. An act read but not passed at the session of February-March, 1638-9, "for allowing booke to certain felonies" (including runaways), adjudged "death by hanging except the offender can read Clerk like in the judgment of the court." The first "act concerning negroes and other slaves" was passed in September, 1664, and was an effort to put a stop to amalgamation; free women who consented to bear children to slave fathers being made slaves during their husbands' lives, and the offspring following the father's condition. "An act for the liberties of the people," not passed (February-March, 1638-39), was on behalf of "all the inhabitants of this province being Christians (slaves excepted)." Indians are more often referred to than negroes, as in "an act touching pagans." The morals of the "servants" are reflected in acts against bastardy, and in the curious case of defamation, reported at length, of Spinke *vs.* Barber; the Assembly, on a technicality, reversing the decision obtained by the "light carryaged" Mrs Spinke against her former master. Engrossing and forestalling, and "lawfull tender," were still other subjects of legislation. In measures, the "Winchester Busshell" was adopted in 1641. And in 1638-39 it was enacted that "all contracts made for paymt. in Corne shall be understood of Corne shelled, & a barrell of new Corne tendred in payment at or afore the fifteenth day of October in any Year shall be twice shaked in the barrell and afterward heaped as long as it will lye on; and at or before the feast of the nativeity shall be twice shaked and filled to the edge of the barrell or else not shaked and heaped as before. And after the said feast it shall not be Shaken at all but delivered by Strike."

—Few numbers of *Le Livre* have been of better quality than that for February, the fiftieth. It opens with an article by M. R. Chantelauze, on "The Last Love of J. J. Rousseau," which introduces to us a professed copy of a hitherto unpublished letter addressed by the philosopher on March 28, 1770, from Monquin, to Lady Cecilia Hobart, an English flame. This epistle, carefully written in a hand assigned to the close of the last or the beginning of the present century, is mainly a justification of suicide, conformably to the mood of his correspondent and her English lover (not Platonic), but indulges in rhapsodies about love in general and the writer's for her in particular, in a manner of which Rousseau was certainly capable, and in a style which is not obviously not that of the author of the 'Nouvelle Héloïse.' Lady Hobart has not been notorious among Rousseau's acquaintances, though she must have been a tremendously bright spot in his dismal English experience, nor have M. Chantelauze's researches put her existence and identity past dispute. He relies, therefore, chiefly upon the internal evidence, and offers some interesting comparisons from the 'Confessions,' etc. We will mention a possible confirmation which he has overlooked. The letter to Lady Hobart is very long, and even so is fragmentary, lacking the conclusion. In the known correspondence of the period it can only be compared for length with the letter of Feb. 26, 1770, to M. de Saint-Germain, which has very properly been styled the complement of the 'Confessions.' Now, on the same day that he was writing to Lady Hobart, he wrote to M. Moultou a much briefer note, cutting it short with the excuse, "Le papier me manque"; and it is small wonder if his stock of paper gave out after so prolonged a drain upon it as the Hobart letter called for.

—The second article, by M. de Saint-Heraye, describes the late Henri Martin's curious entrance into literature as a novelist, poet, and journalist. This is accompanied by a striking pen-sketch of the historian, made about 1860. The third article, by Adolphe Racot, is an entertaining review of the origin and development of the *Revue des Deux Mondes*, apropos of its recent removal to new offices at No. 15 rue de l'Université, in the venerable hôtel once occupied by Joseph de Beauharnais. No one can read this narrative without a feeling of admiration for that *paysan du Danube*, François Buloz, and his able lieutenants, the grim Gerdès and the diplomatic Bonnaire. We pass over the "Recent Studies on Jacques Casanova," of whom a newly discovered bust is engraved expressly for this number. The editor, M. Octave Uzanne, takes the floor in a chat about men and things which promises to be a useful innovation in the scheme of *Le Livre*. He falls foul of the much lauded Lami-Lalauze designs for Musset, which he declares destitute of originality or fitness, and much inferior to Bida's. To accompany them, however, the publisher, Lemerre, contemplates a quarto *édition de luxe* of Musset's works, and M. Uzanne improves the opportunity to show how ill edited this author has been. In its amiable attention to American affairs, *Le Livre* makes this month the pardonable error of transplanting "le célèbre historien G. Bancroft" to Mexico, where he is said to be gathering observations for his great work on the aboriginal populations of America; Mr. Hubert Howe Bancroft being certainly intended.

—Cowen, Moszkowski, Brahms, and Liszt were the very modern names on the programme of Saturday's Philharmonic concert in Brooklyn. Cowen was represented by his "Scandinavian" Symphony, and Brahms by his Variations on Haydn's Chorale St. Anthony, both of which compositions were heard at the last Philharmonic concert in this city. Of Liszt, the familiar symphonic poem, "Tasso," was given — one of the most original and most superb of modern compositions, sorrowful and weird in the "lamento" part, while the "trionfo" is an outburst of exuberant feeling that places it on a par with the most inspired national hymns. The novelty of the concert was Moszkowski's violin Concerto opus 30. In listening to this work it is difficult to realize the fact that the author has not yet reached his thirtieth year. It is easy to predict that his name will be very prominent on the concert programmes of the next twenty years and thereafter, if he fulfils the expectations raised by his compositions that have so far appeared. Some of his piano-forte pieces already enjoy a deserved popularity. They reveal the influence of the three most potent factors in modern musical life—Chopin, Schumann, and Wagner, coupled with a distinct reminiscence of Bach. Moszkowski's music, like his blood, unites Polish and German elements, his father having been a Pole, while he himself was born at Breslau. His violin concerto is a most valuable addition to the limited repertory for that instrument. In its orchestral part it frequently suggests "Tristan and Isolde" by its modulations and instrumental combinations. The theme of the first movement is vigorous, original, and finely elaborated; the second movement is a sweet, dreamy andante; the third appears of less musical value, but gives the soloist many opportunities to display his powers. The difficulties of execution are frequently very great, as they are not merely of a technical nature, but arise in part from the necessity of connecting the ever-changing harmonies by clearness of phrasing and correctness of accentuation. Mr. John F. Rhodes played the solo part with technical ease and elegance, pure intonation, and graceful and delicate movement of the bow. Far from being afraid of difficulties, he chose them where an easier version is offered for choice in the score. A broader and more sonorous tone would have been acceptable in some of the cantabile passages. The novelty was well received by the audience.

GREEN'S 'CONQUEST OF ENGLAND.'

The Conquest of England. By John Richard Green, M.A., LL.D. Harper & Bros 1883.

J. R. Green once said of himself: "I know what men will say of me—'He died learning.'" Nothing in the whole of his works affords a more striking instance of his penetrating insight than this casual remark, recorded in the prefatory memoir which precedes the 'Conquest of England.' "He died learning." These three words, like all true sayings, have a profound application; they hit exactly the most noteworthy, and yet perhaps the least noted, features of Green's rare and admirable genius. We may indeed doubt whether, like all men of vivid imagination, he did not overrate the intelligence of others. It is quite possible that critics might not of themselves have said of our author what he has said of himself. But the words, once uttered, are a revelation. Any person of ordinary acumen can see their truth. The true source of all that was best in J. R. Green's work was that he died, and one must add also *lived*, learning.

The saying we have cited has two sides. It points, in the first place, to the rarest among the many rare gifts possessed by the deceased historian. Every line of his writing, and even those passages which savor most of paradox, or may on other grounds be open to fair criticism, show that he never lost the inestimable capacity for learning. His mind remained, to the day of his death, open to new truth. He retained, to the end of life, a keener glance for new facts than is generally possessed even by men of high talent or true genius in the vigor of early youth. To compare the author of the 'Conquest of England' in this respect with living writers, would be invidious. But one may be allowed to illustrate his preëminence in respect of the capacity for receiving new ideas, by comparing him with men whose fame, like his own, has become a portion of English literature. Hallam and Macaulay have each attained a rank among the writers of their country of which a premature death has deprived J. R. Green. One whose course was only beginning can never, from the nature of things, accomplish those lasting results of life-long labor which can be achieved by men to whom nature has given rare gifts of intellect or imagination, and to whom fortune has granted the full length of days during which these gifts may be cultivated and developed. But though our author cannot exhibit such fruits of his labors as have been produced by the writers whom we have named, he may boldly compare with them in respect of openmindedness. Of neither Hallam nor Macaulay would any competent critic speak except in terms of profound respect. Yet whoever has studied their works will see that neither of these eminent men retained at the end of his career the peculiar capacity for receiving new

light which distinguished J. R. Green. Long before Hallam or Macaulay had ended his career, every one knew the way in which each of them would look at the problems—we may almost say at the facts—of history. They each exhibited, to the end of their lives, extraordinary power for seeing and expressing certain aspects of the topics with which they each dealt; they were each assiduous and conscientious workers; they each, therefore, accumulated additional stores of information. But of neither of them could it be said, in the same sense as of Green, that he died learning.

To say this is not to cast a slur on writers worthy of the high fame they have attained. But to point the contrast between them and the author of the 'Conquest of England' is a fair mode of calling attention to one of his noblest qualities. To men of even greater fame than he, the period of growth or development comes to an end at a very early time in their career. They spend the rest of their lives in using their full-grown and matured strength. They develop and work out ideas which came to them in the period of youth and of growth. Green never seems to have stopped growing Increase of years might no doubt have brought with it some pause in mental development; but those who recall the animated, unresting activity of a mind which seemed more alive at the very point of death than are the souls of most of us in the midst of full health and life, may well believe that age itself would not have dimmed the brightness of that light-loving spirit. One may well suppose that he, like Walter Bagehot, might, however long his life, have remained to its end capable of receiving all the new lessons which might be suggested by new discoveries and new theories. It is, at any rate, clear that his last volume was written by one who, in the midst of a desperate struggle for existence, could not, if he would, have diverted his mind from entering into every new path of speculation which opened to his view.

In nothing, for example, have even the best of English historians shown themselves, with some very rare exceptions, more lamentably blind to important phenomena than in their propensity to neglect the legal aspect of English history. So far has this negligence been carried that at the present moment we may fairly say that the speculations of lawyers are forcing new fields of inquiry upon the notice of historians. It is no marvel that in his earlier works J. R. Green should have been guilty of an oversight shared by writers of high standing and established reputation. What is noticeable is that unmistakable signs are contained in his last volume that he had opened his eyes to the vast importance of law as an explainer of history and as a part of history. The passage on early English jurisprudence, and the chapter on the "England of Ecgberht," put side by side with another passage contained in the chapter on "Wessex and the Danelaw," show plainly enough that our author had turned his mind towards the influence of law. Here, as elsewhere, he was learning to the last. Exactly the same characteristic exhibits itself in a somewhat different form when he is treating of a very different topic, namely, the character of Danish warfare. Any student who has read with any thoughtfulness the accounts of the attacks made by the Northmen on different parts of Europe, must have felt a vague kind of perplexity about the question how it can have happened that hordes of pirates harassed, alarmed, and in many cases conquered countries occupied by settled and comparatively civilized populations. To remain in this condition of vague and uninquiring perplexity was utterly foreign to Green's genius. One can see at a glance that he brought the whole stores of his knowledge, and the whole force of his vivid imagination, to the solution of a question of which many writers only half realize the difficulty, and therefore leave without a satisfactory reply. We do not assert that Green entirely solves a problem which, even after studying his pages, seems to us to present considerable difficulty; but we do assert that these pages throw great light on an obscure point. As you read Green's account of Danish warfare, the success of the Danes becomes at least comprehensible, and one for the first time realizes all the horror which this success excited in the minds of men who saw civilization itself menaced by a new attack of heathenism and barbarism.

This capacity for taking in at a glance the new and striking aspects of his subject was the main cause of Green's extraordinary literary success. A book written as a manual for students became suddenly one of the most popular works of the day. The 'Short History of the English People' had not been long published before it occupied on every drawing-room table the place generally filled by the last popular novel. The book was not written in the interest of any party; its author was not the assailant or apologist of any set of opinions; he propounded no new paradox; he did not tell a new story, but repeated a tale which had been told scores of times before. What, then, was the cause of the triumph achieved by his work? It was to be found in his invention of a new style in narration. He made a "short" history interesting by bringing into relief the salient and the noteworthy aspects of his subject. To do this with effect required, no doubt, remarkable command of all the resources of language; but something much more was needed than mere literary skill. The one quality which was absolutely essential to the due performance of the task Green had set himself, was a clear eye for the great outlines—for the important, and therefore interesting, aspects of English history. In this keenness of vision Mr. Green surpassed almost every other author who has tried to tell the tale of England's greatness. No doubt, with him as with other men, the strong and the weak side of his genius were closely connected together. While his attention was fixed on the great matters which interested himself and his readers, he occasionally fell into minor errors, which were detected by persons of not half his substantial knowledge. But let any critic who remembers Green's description of the effect produced by the translation of the Bible, say whether any one has ever excelled our author in the capacity for making clear to his readers the true signifi cance of the change, which opened to the whole people of England the hitherto-concealed treasures of Hebrew literature.

The 'Conquest of England' deals with a period which gives little scope for the full display of Green's special talent. His art as a narrator conceals from his audience how imperfect is our knowledge, and, we must in common honesty add, how dreary are the details, of the struggles between barbarians and settled races only a trifle less barbarous than their invaders. But whenever the opportunity arises for using his special talent, Green shows at once that the approach of death did not dim the brightness of his historical imagination. Cnut is, next to Alfred, the greatest of the rulers who come before us in Green's last volume. To most Englishmen he is little better than a name; but students who read these pages will, we are convinced, often feel that they for the first time understand the position and the greatness of the Danish monarch who identified himself with the national feeling of the people to whom by race he was a stranger. Green, we find, had till the very last day of his life something new to teach us. He died teaching, because he died learning.

But the saying with which we commenced this article has another and deeper significance. It calls our attention to Green's mass of learning and information. His talent as a writer has excited so much admiration that it has indirectly caused some injustice to his eminence as a master of his subject. His knowledge is so much part of himself that uncritical readers hardly realize how great his knowledge in reality was. They do not see that the vigor, the effectiveness, the very brilliancy of his style, is due in no small measure to his complete command of facts. A writer very different from the author of the 'Conquest of England' suffers at the present moment in popular estimation from much the same cause as that which unfairly diminishes Green's reputation for learning. The decision, the resonance, the ring of Macaulay's style strikes every one. It is natural enough that the qualities which for the most part evoke popular admiration are really the source of Macaulay's influence, and more than one imitator has imagined that to catch Macaulay's style was to seize the secret of his power. But whoever has tried the experiment must have found that while to imitate or parody the vices and even the merits of Macaulay's style was easy enough, such imitation always ends in the dreariest of failures. The imitator has seized the form, but has lost the spirit which alone made the form bearable. Macaulay's force lay at bottom in his minute and, so to speak, personal acquaintance with the times in which he wrote. This personal relation to the men of past ages, which occasionally displays itself in the prejudices and passions of a person who might have been actually contemporary with Penn or Marlborough, or Addison or Johnson, produces that fertility of allusion, that aptness of trenchant and superabundant illustration, which is the permanent charm of the celebrated 'History of England,' or of the even more charming 'Critical and Historical Essays.' Yet the majority of the world, because they fancy that Macaulay's real power lies in his style, deny or overlook the amplitude of his knowledge. So it is too apt to be with the current critics of J. R. Green. He is so brilliant as a writer, his skill in presenting to our view the most striking aspect of his subject is so obvious, that even intelligent students overlook, even if they do not deny, the compass of his knowledge. He never plays the pedant, and therefore he never gets with the public full credit for learning. But whoever reads Green's notes on the condition and history of English towns—notes which, as we understand the matter, have not received the last touches that would have been given them by their writer if he had lived—will easily see that he was, in spite of the brilliancy of his style, something much better and greater than a striking writer, and that he died learning because he had lived the studious, concentrated life of a learned man devoted to learning.

BEAUREGARD JUDGED BY HIMSELF.

Military Operations of General Beauregard. By Alfred Roman. In 2 vols. Harper & Brothers.

THIS book contains much of interest and value. General Beauregard was one of the highest officers in rank in the Confederate service, and was concerned in many important operations during the civil war. The narrative throws light on not a few of the great junctures of that struggle, and is enriched by a mass of official documents, many of which are published for the first time. The arrangement is clear and the style easy and attractive.

When this much has been said, there remains

but little more in praise of this book. Its faults are too many and glaring to be overlooked. The chief sufferer from its publication is likely to be General Beauregard himself, and it had been better for his reputation if he had assumed less directly the responsibility for Colonel Roman's work. The book is not so much a history of General Beauregard's career as it is a fulsome panegyric of him, an overstrained and often disingenuous defence of everything he did, or did not do, during the war, and an unfair and ill-natured critique upon the conduct of his superiors. We believe there is not a single superior officer of General Beauregard that is not disparaged in this book, and accused of damaging, at one time or another, the cause of which General Beauregard is represented as the only ever wise and ever unselfish defender. The object of our author's special hostility is Mr. Davis, but the Confederate Secretaries of War, the chiefs of the war bureaus in Richmond, and Generals Cooper, Lee, A. S. Johnson, J. E. Johnston, besides many of lower rank, come in for their share of criticism; a criticism often ill-judged, in most cases partial, and nearly always truculent.

The author's mode of dealing with history is illustrated by his account of the first battle of Manassas. The facts in regard to this are simple. In July, 1861, the Confederate Government had two principal bodies of troops hastily collected to oppose the invasion of Virginia, threatened by the as hastily gathered levies of the Federal Government. The larger of these, under General Beauregard, held the line of Bull Run, and in its front was the principal Federal army under General McDowell. Beauregard's force was being augmented by new regiments as fast as they could be armed and equipped out of the meagre supplies the South could then command, and by the middle of July numbered about 20,000 men. The other Confederate army, of about 10,000 men, under Gen. J. E. Johnston, was opposing General Patterson's advance into the Shenandoah Valley. Besides these, General Holmes had a small force on the lower Potomac. Both of the larger bodies were greatly inferior to the Federal forces opposing them. McDowell had about 35,000 men and Patterson about 20,000. As McDowell's was the principal Federal army, it was pretty clear that the first serious advance would be made by it. It was also evident that the Confederate forces at Manassas would not grow fast enough to place it on an equality with the army in its front, and therefore General Beauregard suggested the expediency of uniting the forces of Johnston and Holmes with his own for a sudden attack upon the Federal armies in succession. This proposal Beauregard submitted through one of his staff to Mr. Davis on the night of July 14. Generals Cooper and Lee were called in conference by Mr. Davis. The plan required that General Johnston, who was seventy-five miles away, should leave 5,000 men to hold Patterson in check, and rapidly join Beauregard with 20,000. This would double the Confederate force at Manassas and make it superior to McDowell, who was to be attacked and beaten. Then Johnston was to return with his own and 10,000 of Beauregard's men and overwhelm Patterson. Beauregard thought a week would suffice for this, after which Johnston was to reinforce Garnett in West Virginia and destroy McClellan. Then Johnston's and Garnett's forces were to cross the Potomac and attack Washington in rear, while Beauregard assailed it in front. This scheme was rejected as impracticable by all present at the conference, because, 1, Johnston had hardly 10,000 men, instead of 25,000, which Beauregard's plan assumed; 2, McDowell's army was too close to Washington to permit of its being crushed in the way indicated. If pressed, it could readily fall back to that city and its reserves. Another reason General Beauregard might himself have added: neither of the Confederate armies was supplied with transportation or stores sufficient for the complicated movements mapped out.

On July 17, the third day after this conference, McDowell advanced, and Beauregard telegraphed the fact and asked for reinforcements. Johnston was then ordered to join him if practicable with his effective force, and Holmes was also sent up. Next day occurred Tyler's attempt at Mitchell's Ford, ending in a Federal repulse. Beauregard's report apparently caused the Confederate authorities to think that McDowell had been severely checked, for next day (19th) Beauregard was telegraphed as follows: "We have no intelligence from Gen. Johnston. If the enemy in front of you has abandoned an immediate attack, and Gen. Johnston has not moved, you had better withdraw the call upon him, so that he may be left to his full discretion. . . ." Beauregard, seeing that the Federal army in front was only perfecting its plans for attack, of course did not stop Johnston, who reached Manassas on the 20th, followed by his troops during that night and the next day. As Johnston had merely eluded Patterson, who must soon learn of his movement, both Confederate generals felt that no time was to be lost in fighting McDowell. Johnston was senior, and in command, but, having no time to learn the country or disposition of the troops, adopted Beauregard's plan of attacking McDowell at Centreville next day (21st). The aggressive movements of the Federals early on the 21st prevented the execution of this plan. Beauregard then proposed to check McDowell's movement against the left by attacking with the Confederate right. This, too, was approved and adopted, but the orders sent by Beauregard failed to reach the Confederate right in time. Meantime, McDowell had turned the Confederate left and was pressing back with overwhelming force the troops there stationed. All plans of aggression were now abandoned in order to resist McDowell's attack, and a battle, unforeseen in character, location, and disposition of troops, ensued. Both generals hastened to the point of danger and exerted themselves successfully to stay the progress of the Federals. Johnston then left Beauregard in command of the troops engaged, and, taking a position with reference to the whole field, devoted himself to hastening forward reinforcements. These came up so promptly that Beauregard, taking advantage of the check which Jackson's stubborn stand had wrought, was soon able to resume the offensive, and within a short time the Federals were not only defeated but routed and driven with fearful panic across Bull Run.

Mr. Davis reached the field after the battle was over, and that night, when the panic of the Federal army had become partially known, was anxious for an immediate advance toward Washington. Both generals thought this inadvisable, so great was the exhaustion and confusion in the Confederate ranks produced by the battle, and so inadequate the stock of supplies and transportation then available. On the night of the 22d, at another conference, the generals declared it was impracticable to cross the Potomac or to advance at once on Washington in the wake of the defeated army. Mr. Davis seems to have been satisfied with the propriety of this judgment, and the idea was abandoned.

Such are the facts. Let us see what Colonel Roman makes of them. On the basis of the reduction of Fort Sumter, General Beauregard's skill and reputation are spoken of in the most extravagant terms. He then describes the proposal of July 14 as a troke of genius, and says: "A high tribunal, composed of the President, Generals Cooper and Lee, took upon itself to check and render barren the strategic powers so greatly developed in General Beauregard, and in which the immortal Jackson alone is acknowledged to have been his peer." Over and over again, with tiresome iteration, are Davis, Cooper, and Lee denounced for not committing themselves without hesitation to a scheme utterly impracticable as Beauregard put it, since it assumed nearly three times as many troops with Johnston as he actually had. Had the troops been at hand, half-drilled, inexperienced, badly equipped, with insufficient transportation, as they were, the chances of success would not have been more than one in one hundred, and there is nothing in General Beauregard's subsequent career to lead to the conviction that he was the man to seize that single chance. Again, the despatch of the 19th is tortured to mean a withdrawal of assent to the union of Johnston and Beauregard, and the latter is highly praised for pocketing the despatch and thus insuring the junction of the two forces, while Mr. Davis is unsparingly condemned for sending it. The despatch shows for itself. Johnston was not to be stopped unless McDowell had abandoned his immediate attack, and even then discretion was left with Johnston (the senior officer) as to his movements. McDowell had not abandoned his attack, and therefore Beauregard did simply his duty in holding the despatch. Colonel Roman goes on to say:

"We assert it as an incontrovertible truth, fully proved by later events, that the President of the Confederacy, by neglecting to compel his Q. M. General to procure the transportation which could have been easily procured more than a month before the battle of Manassas; by refusing, as early as the thirteenth of June, to assent to General Beauregard's urgent request that authority should be given to concentrate our forces at the proper moment at Manassas Junction; by again refusing, on the fifteenth of July, to allow him to execute his bold, offensive plans against the enemy, the certain result of which would have been the taking of Washington—that the President of the Confederacy, by thus persisting in these three lamentable errors, *lost the South her independence.*"

It is hard to tell whether the absurdity or the vanity of this statement is most striking. That the Quartermaster and Commissary, as well as all other departments of the Confederate Government and army, were new and in many respects inefficient, was certainly the case; but probably no country without any military establishment or central government, and peopled by citizens untrained to war for generations, ever acted with greater energy than did the South in the three months between the opening of the war and the battle of Manassas in raising and supplying armies. The victory of Manassas is itself one of the best proofs of this. General Beauregard is entitled to a large share of credit for this remarkable victory, and we think this has been accorded to him; but it must have been under some malign star that he allowed his biographer to make such claims as we have quoted.

Our author continues in the same strain in regard to Beauregard's position on the field of Manassas, about which there is no proper room to doubt. He was second in command under Johnston, who adopted his plans until McDowell's advance checkmated them, when each in his sphere did his best to secure success—Beauregard as commander of the troops engaged, and Johnston as commander-in-chief. After the battle Johnston was strongly opposed to advancing, and so, too, was Beauregard for a time. But Colonel Roman, through many pages, labors to prove that Johnston had nothing to do with the battle of Manassas except to act as a

dead weight upon the soaring genius of Beauregard; and he only ceases to abuse Mr. Davis and the Quartermaster-General for not permitting him to take Washington, in order to criticise (in milder terms, it is true) General Johnston for the same fault. Yet while there are plenty of complaints of others, and numerous suggestions as to matters beyond his jurisdiction, there is no practicable plan of offensive campaign, after Manassas, proposed by General Beauregard.

A similar tone pervades the whole book. When General Beauregard is sent to the West, he finds everything wrong in Gen. A. S. Johnston's department. The line of defence has been badly chosen, the works to strengthen it have been laid out without judgment, the vital importance of the defence of the Cumberland and Tennessee Rivers has not been foreseen or properly provided for. General Beauregard promptly proposes a plan of operations to counteract these blunders. It is not adopted, and hence follow, in his opinion, the fall of Donelson and the subsequent disasters of the Confederates. Again, it is General Beauregard who, in spite of the indifference or opposition of his Government, and without the aid of his commanding officer, collects and organizes an army at Corinth, urges and finally induces General Johnston to unite his forces with it, and plans and does everything about the battle of Shiloh—except to fight it. General Beauregard is made to stand out as a solitary rock in a sea of incompetency and petty jealousy. Yet when the chief command devolved upon Beauregard, by the death of Johnston, we see little to justify Colonel Roman's estimate of his ability. A great victory was just within the grasp of the Confederates. It was allowed to slip away from them. Next day the tables were turned, and Beauregard was forced to retire to Corinth. Weeks followed, during which not a single stroke by the Confederates checked the onward progress of the Federal arms in the West. Beauregard's strategy consisted in sacrificing garrisons along the Mississippi, and in waiting at Corinth until the advance of the Federal army made a retreat necessary. He then fell back, with losses the amount of which is matter of dispute, to Tupelo. Yet these feeble operations are extravagantly lauded by our author.

One of General Beauregard's striking propensities seems to have been to draw up elaborate plans of operation on every possible occasion and for everybody. These schemes are usually based upon the maxim that it is wise to concentrate one's own masses against the fragments of the enemy. This rather obvious maxim is repeated time and again, as if it were not apt to occur to any one besides General Beauregard himself. The maxims of war are simple enough, the difficulty lies in their application. There is nothing in the retreat from Corinth, and still less in the retreat before Sherman through South Carolina, to show exceptional readiness or skill on the part of the Confederate leader in the application of his own maxim. But so large were the views of General Beauregard that they were seldom confined to his own department. He was ever ready, without solicitation, to prove to his superiors, from the President down, that he knew their business better than they did themselves, and Colonel Roman is never tired of assuring us that the result of the war would have been different if General Beauregard's genius had been allowed full scope. Prophet-like, Beauregard continued to deliver his message, whether heeded or not; and even when the Confederacy was *in extremis*, and when all his energy should have been directed to concentrating the troops of his department on Sherman's front, he found time to say to Mr. Davis: "I earnestly urge a concentration, in time, of at least 35,000 infantry and artillery, at Salisbury, if possible, to give him battle there and crush him; then to concentrate all forces against Grant, and then to march on Washington to dictate a peace. . . ." Colonel Roman zealously defends this proposition against the criticisms of Badeau, who attributed it to ill health. Sometimes a man's enemies are kinder than his friends.

General Beauregard's ideas of official propriety were in some respects singular. He early became engaged in controversy with Mr. Davis about his report of the first battle of Manassas, to which he prefixed unnecessary and improper statements. Most remarkable, however, is the complaint made about his removal from command after his retreat from Corinth. The Confederate army had just fallen back before overwhelming forces, the Mississippi seemed about to fall into Federal hands. It was the first of June, when the Union armies might be expected to push their advantage with increasing vigor. At this juncture, without conference, and without any notice beyond a telegraphic despatch to his Government, General Beauregard proposed to leave his army, on a surgeon's certificate, to seek rest and recuperation at a distant watering-place. General Bragg, the next officer in rank, had been ordered elsewhere by his Government, but General Beauregard retained him, turned over the command to him, and actually left his post for the purpose indicated. The Richmond authorities promptly relieved Beauregard and placed Bragg permanently in command, and yet Colonel Roman, with the sanction of General Beauregard, bitterly complains of the injustice and harshness of the Confederate Administration! Mr. Davis has always been represented as being possessed of no little infirmity of temper, but after reading this book we have come to the conclusion that his faults in this respect have been grossly exaggerated.

Colonel Roman's book is so filled with indiscriminate praise of General Beauregard, and indiscriminate blame of nearly everybody else, is so taken up with showing what "might have been," and in pointing out how it was always somebody else's fault that General Beauregard's splendid schemes failed of their end—how, for instance, it was the lack of the car-load of generals, which was denied him, that paralyzed the Confederates at Shiloh; how it was Whiting that saved Butler from ruin at Petersburg; how it was Hood alone that destroyed the Confederate army in Tennessee; how it was Hardee that lingered in Charleston so long as to defeat a concentration in Sherman's front—that we are apt to lose sight of General Beauregard's real achievements. These were solid. The defence of Charleston, on which General Beauregard's military reputation will rest most firmly, was a fine exhibition of engineering skill and of indomitable energy and determination. It will give him a high rank among military engineers long after the extravagant claims set up by Colonel Roman in regard to his skill as a strategist shall have been forgotten.

MINOR FAUST-LITERATURE.

Goethe und Kein Ende. Rede bei Antritt des Rectorats der Königl. Friedrich-Wilhelms-Universität zu Berlin am 15 October 1882 gehalten von Emil du Bois-Reymond. Leipzig. 1883.

Die vegetarische Weltanschauung in Goethe's Faust. Vortrag gehalten am 22 Januar 1883 im Musiksaale der Königlichen Universität zu Breslau von Max Engelmann. Breslau. 1883.

Das Buch Hiob und Goethe's Faust. Vortrag gehalten im Kaufmännischen Verein zu Darmstadt von Dr. Julius Landsberger. Darmstadt. 1882.

PROFESSOR DU BOIS-REYMOND'S address consists of several lines of reflection suggested by passages in "Faust," and is especially interesting as containing the conclusions of its author concerning the merits of Goethe as a scientific investigator. Commenting first upon the saying of Mephistopheles:

> "Grau, theurer Freund, ist alle Theorie,
> Und grün des Lebens goldner Baum,"

the speaker points out the real diabolism of such doctrine for the university student, and then passes on to notice the fact that Goethe is constantly pressing this antithesis between theory and life, and always at the expense of the former. He is forever preaching his gospel of practical activity and physical enjoyment, and seeming to set these above mental toil and the joys of the lonely thinker. But surely the mass of men are sufficiently inclined to pleasure by nature, and as for work, they are compelled to it. How then is Goethe's oft-repeated counsel to be justified or even understood? By way of answering this question the address propounds a theory that Goethe's gospel of work was due to an original defect in his own endowment. Instead of possessing that perfect equilibrium of powers which has been so much wondered at, he was by nature indolent, and his philosophy of life was influenced by his own conscientious effort to overcome this weakness. He assumed that others were like himself, and hence his frequent and urgent advice, so superfluous to the great majority, "resolut zu leben." (But the question is, after all, whether laziness like that of Goethe is not a more widely diffused fact of human nature than the Berlin professor supposes.)

Attention is then drawn to the "psychological untruth" of Faust's character. He purposes to end his life because he sees that "we can know nothing." But the will to live is always stronger than the desire of knowledge, and then, too, Faust's *ignorabimus* has no sense. He believes from the outset in a spirit-world, he talks with spirits, yet he professes to be in doubt about a future life, and he bewails the loss of his early religious faith. What need of faith in one for whom sight has already solved the all-important questions? Or why should one who is cheek by jowl with a personal devil refuse, when catechized by Margaret, to admit a personal God? The explanation offered for these incongruities—and it may be said in passing that neither the difficulty nor the solution is at all new—is that the supernaturalism in "Faust" is a part of its sixteenth-century *costume*; beneath the costume we find people of a later time.

The discussion of Goethe's scientific standing comes apropos of the lines in "Faust" beginning:

> "Ihr Instrumente freilich spottet mein."

It is remarked that these lines express Goethe's deep-seated aversion to the methods of the laboratory—that is, to physical experiment and the mathematical treatment of the same. This aversion is the occasion of the polemic against Newton. What Goethe lacked—so Du Bois-Reymond judges—was the idea of mechanical causality, an idea which from the very nature of the human mind must lie at the basis of physical science. But Goethe took no interest in causes. He confined himself to a purely graphical description of facts, or, in his experimenting, he merely tried to bring one phenomenon out of another and to note the result in much the same temper as one watches the transformation of one cloud-image into another. In spite, there-

fore, of Goethe's undoubted successes in lines of investigation where this sense of mechanical causality is of less importance, and where the artistic sense of form is available as an instrument of research, that is to say, in animal and plant morphology. Du Bois-Reymond is of the opinion that "without Goethe's efforts science would be just as far advanced as it now is." Objection is made to Haeckel's regarding Goethe as a precursor of Darwin; for though the poet certainly had the idea of the kinship or common descent of all living forms, yet the essential and important thing was not to get hold of this idea, but to find the proofs of it. From Darwinism, as we understand it, Goethe would have turned away in disgust. But what need any one care—the address asks in conclusion—about the exact value of Goethe's scientific studies? Like the poetry of Frederick the Great, the science of Goethe should be allowed to rest, and not be continually extolled to the uncritical multitude to the provocation of those who know better.

Thoroughly pleasant is the impression which Herr Engelmann's address leaves upon the mind, although an attempt to present Goethe as an apostle of vegetarianism might seem in advance a little precarious. But the vegetarianism of Herr Engelmann, we are assured, is no mere question of the stomach: it is a "poetic principle in the fullest sense of the word"; the "only possible solution of the social question"; an "important philosophy which is now victoriously advancing everywhere, opposing itself alike to fantastic idealism and to crass materialism." After a preliminary clearing of the ground, Herr Engelmann defines the vegetarian position about as follows: We can recognize no better or higher aim in life than to enjoy that life with every fibre of our being to the last breath, and that the rather since the most of us do not believe in a future life for the individual. The gaining of eternal bliss does not interest us, since we can form no conception of it, and the idea of non-existence affords us an equal satisfaction. The earth, in its manifoldness, suffices us. Nature is our paradise, for we understand her language and submit ourselves joyfully to her laws. That which others call the universe or God, we silently honor as the Eternal Riddle. For the vegetarian, therefore, as for Faust, the supreme question is the question of enjoyment; and, like Faust, he finds this at last in simply accepting the human situation, ignorance and pain included, and going briskly to work for the comfort of his neighbors. Herr Engelmann goes through the entire drama, to conclude ultimately that it is "a history of the development of the vegetarian—that is, of the healthy, natural philosophy which shuts out all extremes."

Rabbi Landsberger's oration draws an interesting parallel between "Faust" and the book of Job. Each poem has its prologue in heaven. Each is founded upon a popular religious saga already in existence. Both heroes are tempted by the devil in the direction of moral ruin, and the devil is in each case commissioned by the Lord, with definite restriction of powers. In the one case, the tempter's instrument is misfortune; in the other, it is pleasure. Both heroes succumb temporarily, and both are finally saved by one and the same power—namely, love.

When one sees what all can be, with more or less plausibility, read out of or read into Goethe's wonderful drama, one is reminded of the Manager's words in the prelude:

"Ein jeder sucht sich endlich selbst was aus.
Wer vieles bringt, wird manchem etwas bringen,
Und jeder geht zufrieden aus dem Haus."

Mozart. By Dr. F. Gehring. [Hueffer's Great Musicians Series.] Charles Scribner's Sons. 1883.

Dr. Gehring's monograph on Mozart consists of 130 pages, and forms a useful addition to Dr. Hueffer's series of musical biographies. It does not contain much that is new, but collates the well-known facts, with occasionally an excessive regard for insignificant dates and details. The greater part of the book relates to Mozart's early life, which gives rise to the suspicion that the author commenced his work on too large a scale, and was subsequently forced to economize space. But the truth is, that more is known of Mozart's childhood than of that of any other composer, owing to the preservation of the valuable family correspondence; while later in life his operas and concert pieces did not receive that attention in the political and musical press which similar compositions would receive at present. Mozart enjoyed considerable popularity during his lifetime, but few had an idea of the greatness of his genius. Among his chief admirers were Haydn and Gluck. On one occasion, after playing the violin part in some new quartets, Mozart taking the viola, Haydn exclaimed to Mozart's father: "I tell you, by God, and as an honest man, that I acknowledge your son to be the greatest composer of whom I have ever heard; he has taste, and possesses the most thorough knowledge of composition." And it is reported that his great rival and enemy, Salieri, said, after Mozart's death: "It is indeed a pity for the great genius, but well for us, that he is dead; for, had he lived longer, no one would have given us a crust of bread for our compositions." At the present day no one would give a crust of bread for a composition of Salieri's, nor for the opera "Cosa Rara," by a musician named Martin, which supplanted Mozart's "Figaro" after its ninth performance. Very curious are the opinions passed on an earlier opera, "Die Entführung aus dem Serail," which has now almost completely disappeared from the stage, as its music appears too "thin" for modern taste. In 1782 it was judged differently. "A great deal too many notes, my dear Mozart," said the Emperor; and Mozart replied, "Exactly as many notes as are necessary, your Majesty." It was also urged that the accompaniment overpowered the singers! These criticisms probably originated among the ancient Greeks the first time a voice was accompanied by one or two instruments in unison, and have been urged ever since against every noted composer by his contemporaries. And yet it is often asserted that man is a reasoning animal, who learns by experience to avoid the follies of his ancestors.

Those things in Mozart's compositions which were most severely criticised in his day we now admire most; and those which he wrote to please his contemporaries are consigned to oblivion. That he often did make concessions to the prevailing taste is clear, and we have his own word for it. His father once urged him to bear in mind the unmusical public, and not forget the "Popolare," that tickles long ears. Mozart replied, "Do not trouble about the 'Popolare,' for in my operas there is music for all sorts of people, not excepting those with long ears." The necessity of working for a living and attaining a certain amount of popularity may excuse these concessions to some extent; but to us they render many of Mozart's works, despite occasional tidbits, unpalatable in their entirety. It might be supposed that the excitement-loving, pessimistic audiences of our day would be fond of Mozart for a change; but his uninterrupted good humor and placidity are almost exasperating. Perhaps they would be more relished were it not for the monotonous, stereotyped cadences which break up his compositions into regular eight-bar divisions, like the independent segments of some of the lowest animals, which are not inseparably united with the rest of the body, but are capable of leading an independent life if severed from it. Owing to their artificial, *inorganic* form, most of Mozart's pianoforte compositions and symphonies are dead, notwithstanding the exquisite passages which many of them contain. He will live chiefly through some of his chamber compositions and his three best operas: "Don Juan," "Magic Flute," "Figaro." These have in them the elements of immortality, and are at present, in Germany, second in popularity to Wagner's operas only. In the last act of "Don Juan," Mozart forsakes his lyric boundaries, and his style distinctly foreshadows the modern music-drama. He died at thirty-five. Had he lived another thirty-five years, and accepted the offer of the King of Prussia at a salary of 3,000 thalers, instead of starving and working himself to death in ungrateful Vienna, we might now have a dozen more "Don Juans," some of which would perhaps equal "Lohengrin" in dramatic truthfulness. For Mozart was essentially a dramatic composer, whose inspiration warmed with the intensity and interest of the situation. His chief mission was to irrigate the rich harmonic fields of German music with the limpid stream of Italian melody. He did little to develop musical form; but he advanced the art of instrumentation by many new and beautiful devices. He cultivated every branch of his art, but has been surpassed in every branch by other composers—by Beethoven, Schumann, Rubinstein, in chamber music and symphonies; by Weber and Wagner in opera. Schubert is a more original melodist; Bach, Chopin, Schumann, Liszt, and Wagner more profound harmonists.

Scientific Results of the Vega Expedition. (Vega-expeditionen vetenskapliga iakttagelser). 8vo, pp. 516, 32 pl. Stockholm, 1883.

The second volume of the observations and results of the *Vega* expedition around Europe and Asia has lately been issued, and in the variety and interest of its contents is not inferior to the first volume, which we have previously noticed in these columns. The contents, except when otherwise noted, are in the Swedish language, but will be translated into German for wider circulation ere long. Dr. Kjellman opens the volume by an account of the flowering plants of St. Lawrence Island, Alaska. One hundred and thirteen species are noted, of which eleven belong to the grasses and nine each to the Ranunculaceæ and Compositæ. Fifty-one species are common to Spitzbergen, and sixty-two to East Greenland; three new forms are figured. This is followed by an account of the plants of West Eskimo-land, in which the collection is compared with Seemann's memoir contained in the botany of the *Herald's* voyage. A new Draba is figured.

Nordqvist follows with an account of the mammals of the Siberian coasts. Interesting details are given in regard to the wild and tame reindeer, and the little tame reindeer of the north of Europe are compared with the fine animals of the Chukchi. The Chukchi hare, a new variety of the Arctic *Lepus timidus*, is figured and described. A bat is supposed to inhabit Chukchi-land, but in view of the absence of trees or caves, and the severity of the winter climate, this must be considered doubtful until specimens are obtained. The snow sheep of Eschscholtz (*Ovis nivicola*), which was heard of but not seen by them, is doubtfully referred to as *Ovis montana*, the American form, which it certainly is not. Altogether the region shows (not including whales) twenty-nine species, of

which seventeen or eighteen are truly terrestrial.

Dr. Nathorst contributes an important memoir on the fossil plants of Japan, illustrated by sixteen fine plates. Seventy-seven species are mentioned or described, of which about thirty per cent. are common to the leaf-bearing strata of Alaska.

Lieutenant Nordqvist gives us a general account of the language, religion, and physical characteristics of the Chukchi. Much of this has appeared elsewhere. He found the average height of the men to be about five feet five inches, and of the women five feet and half an inch. The height varied, however, among men from five feet eleven to four feet eleven inches, and among the women from five feet eight and a half inches to four feet eight and a half inches. Experience further south with the inland Chukchi gives the impression that they are taller, on the whole, than the above inhabitants of the Arctic coast. The proportions of the skull also varied from extreme dolichocephaly to sub-brachycephaly, as has been observed by previous travellers. Indeed, many of the heads of these curious people, especially among the Karaks, their near relatives and neighbors, seem almost unnaturally distorted, and would drive a phrenologist to despair.

Otto Pettersson reports on the properties of water and ice, and on the hydrography of the Siberian Sea, in the English language. The former paper excited much attention among hydrographers when a summary in Swedish first appeared under the auspices of the Academy at Stockholm. We have here the full report, written with admirable lucidity. The author devised special instruments for his investigations, and accompanied the Swedish expedition to Spitzbergen for the purpose of settling some moot points. Among the more important researches contained in it are those on the changes of volume of pure and impure water and ice under changing temperatures. Sea ice is found to expand enormously from the freezing point down to a certain temperature, which depends on the chemical impurities contained in the water. A very small admixture of saline matters alters in an extraordinary degree the physical properties of the ice. From the undefined point above mentioned, sea ice slowly contracts. Pure ice, on the other hand, expands from the freezing point to a point less than a degree lower, when it begins to contract slowly but continuously, and with great regularity. Hence the crushing and fissuring of salt ice by sudden fall in temperature is ascribed by Pettersson, not to contraction (as formerly supposed, and as is the case in fresh-water ice), but to the great expansion of the upper layers, away from the sea water. It was the opinion until recently that in the process of freezing the ice excluded its salts, and that such as remained in it were merely mechanically-entangled particles of brine or salt-crystals. Pettersson shows that ocean water is divided by the process of freezing into two saliniferous parts, a solid and a liquid, of different chemical constitution. The ice is richer in sulphates, the brine in chlorides. Cryohydrates also form in crystals almost as stable as the ice itself. Time and changes of temperature continue in the ice the processes which were begun in the water, and more and more of the chlorides are eliminated. Sea ice is the reverse of homogeneous, and in a state of nature is subject to constant change. A factor in the climate of the Arctic regions which has been overlooked is pointed out to exist in the latent heat given out by water at the moment of freezing. The water of the Gulf Stream, for instance, may arrive in the Arctic seas with a temperature of 32° F. only, yet on freezing, the latent heat given out (which has actually been carried from the tropics) must modify to a certain extent the superincumbent atmosphere.

In his second paper Pettersson discusses the hydrography of the Kara Sea and of the Siberian Sea. In the latter the main mass of the fresh water derived from any one of the large Siberian rivers was always found somewhat eastward from its mouth, while an influx of cold bottom water from northward was always drawn in to fill the vacancy. This indicates the easterly set of these waters beyond controversy. At Bering Strait the observations were rather sparse, but indicated the absence of any polar current. The aborigines stated that in autumn and winter the current through the strait was in a southerly direction, at other times it was the reverse of this. The warmest water encountered by the *Vega* in Bering Strait, away from the direct influence of the shores, was 45° F. (6.5 C.), which agrees very well with the Coast Survey observations.

Dr. Wirén discusses the Chætopod annelids of the expedition at considerable length, and his paper is illustrated by several plates. Several new or particularly interesting forms were obtained. Dr. Wijkander contributes a first paper on the magnetics of the *Vega* party, which is in the French language. Observations were made at twelve stations besides those in Sweden. They present nothing remarkable. At Pitlekai the diurnal variations were intermediate between the true Arctic and temperate types. The principal easterly maximum occurred at 9 A. M., and 9 P. M. There was a weak westerly maximum about 2 P. M. These results accord with those of Mr. Marcus Baker, of the U. S. Coast Survey, taken at various points in the adjacent region. The concluding paper of the volume, by Arvid Lindhagen, summarizes the determinations of latitude and time for localities between Nova Zembla and Bering Strait.

George Washington. By John Habberton, author of 'Helen's Babies,' etc. [Lives of American Worthies.] Henry Holt & Co. 1884. Pp. 345.

IN the preface to this work we find a justification of the aim and style of this "unconventional" series of books, with much of which we agree. We, too, would paint men and things as they were, without overmuch regard to the dignity of the historic muse; and we agree that Washington, like other heroes of the series, has suffered from being treated too much like "a tea-shop chromo." We do not suppose that the projectors of the series really intended "to belittle the great personages of American history." On the other hand, we cannot agree that famous men should be *written* about "in the manner that is the rule in familiar conversation about historic characters." Much easy rhetoric and off-hand jesting does very well in "familiar conversation," which reads poorly enough: just as we would not paint the portrait of Washington as he looked when just returned from a ride in a hot spring day over the muddy acres of his plantation. Mr. Habberton tells the story of Washington's life for the most part in good style and with an excellent spirit; but if some friend could have gone over his manuscript and run his pen through all the passages which appear to have been called out by the special requirements of the series, his book would have been vastly improved. It would then have been really an unconventional sketch; the funny parts are generally conventional. For example (p. 116), where Washington, "in his anger, even dashed his hat upon the ground, which was very injudicious, for new hats were not easy to get just then"—the joke is good enough in itself, and the fact it alludes to is worth mentioning; but the introduction of the joke at this point interrupts the narrative and diverts the attention of the reader. But we will do Mr. Habberton the justice to say that in the main he has kept his disposition to joke very well under control.

Wisdom, Wit, and Pathos of Ouida's Works. By F. Sidney Morris. Philadelphia: J. B. Lippincott & Co.

A VOLUME of extracts from "Ouida's" novels has at least the advantage of showing how small a proportion of her work will bear quotation, after the descriptions are counted out. These have always been recognized as beautiful and vivid; but of the good things we have in novels, good description (except of character) is the most abundant, so we care the less to have it cut out for us. Of such selections in general, there is a word needful as to the difference between taking from such an author as Ruskin (who was one of the first to be served up in this way), and from any writer of fiction. Of the first class, all comes from the writer's own standpoint. In a novel, he may speak in his own person or in that of any character, from the villain to the saint; so that the quotations, given as they must be without reference, may do gross injustice to the writer, as well as be false to reason and right.

BOOKS OF THE WEEK.

Adams, R. C. History of the United States in Rhyme. Boston: D. Lothrop & Co. 60 cents.
Alcott, Dr. W. A. Tea and Coffee. Fowler & Wells. 25 cents.
A Fool's Paradise: a Story of Fashionable Life in Washington. In rhyme. Washington: W. H. Morrison. 25 cents.
Ashton, John. The Adventures and Discovrses of Captain John Smith. Printed in old-style type. Cassell & Co. $1.25.
Barnes's New National Readers. Nos. 1, 2, and 3. A. S. Barnes & Co.
Barnes, T. W. The Life of Thurlow Weed. Vol II. Memoir. Boston: Houghton, Mifflin & Co. $7.50 per set.
Blackburn, F. A. The Essentials of Latin Grammar. Boston: Ginn, Heath & Co. $1.10.
Brehm's Thierleben. Chromo edition. Parts 113-120. B. Westermann & Co.
Caird, Sir J. India: The Land and the People. Cassell & Co. $1.50.
Caton, J. D. The Antelope and Deer of America. Second edition. Forest and Stream Publishing Co.
Croker, B. M. Pretty Miss Neville. A novel. Harper & Brothers. 20 cents.
Delitzsch, Dr. F. The Hebrew Language Viewed in the Light of Assyrian Research. London: Williams & Norgate.
Draheim, H. Deutsche Reime. Inschriften des 15. Jahrhunderts und der folgenden. Berlin: Weidmannsche Buchhandlung.
Ebstein, Dr. W. Corpulence and its Treatment on Physiological Principles. Brentano Bros.
Farm Conveniences. 212 illustrations. Orange Judd Co. $1.50.
Fricke, F. W. Erziehungs- und Unterrichtslehre. Mannheim: J. Bensheimer.
Green, J. R. The Conquest of England. Harper & Brothers.
Guyot, A. Creation, or the Biblical Cosmogony in the Light of Modern Science. Charles Scribner's Sons. $1.50.
Harland, Marion. Cookery for Beginners. Boston: D. Lothrop & Co. $1.
High, J. L. A Treatise on Extraordinary Legal Remedies, embracing Mandamus, Quo Warranto, and Prohibition. Second edition. Chicago: Callaghan & Co.
Household Conveniences: being the Experience of Many Practical Writers. 220 illustrations. Orange Judd Co. $1.50.
Hudson, J. R. Tables for Calculating the Cubic Contents of Excavations and Embankments. John Wiley & Sons. 75 cents.
Jeans, W. T. The Creators of the Age of Steel. Charles Scribner's Sons. $1.50.
Lowell, E. J. The Hessians and the Other German Auxiliaries of Great Britian in the Revolutionary War. Harper & Brothers.
McCarthy, J. A Short History of Our Own Times. Harper & Brothers.
McCosh, James. Locke's Theory of Knowledge with a Notice of Berkeley. Philosophical series. No. V. Charles Scribner's Sons. 50 cents.
The Miz Maze, or the Winkworth Puzzle. A Story in Letters, by Nine Authors. Macmillan & Co. $1.25.
Thorold, Rev. A. W. The Yoke of Christ in the Duties and Circumstances of Life. $1.25.
Toy, Prof. C. H. Quotations in the New Testament. Charles Scribner's Sons. $3.50.
Tracy, R. S. Hand-book of Sanitary Information for Householders. D. Appleton & Co.
Tufts, J. H. Rote-Songs of the Normal Music Course, with Accompaniments for the Pianoforte. D. Appleton & Co.
Turgenieff, Ivan. Mumu: and the Diary of a Superfluous Man. Funk & Wagnalls. 75 cents.
Williams, R. E. Cremation and other Modes of Sepulture. Philadelphia: J. B. Lippincott & Co. 75 cents.

Worman, Prof. J. H., and Monsanto, Prof. H. M. First Spanish Book. A. S. Barnes & Co.

Fine Arts.

MR. WALTERS'S ART GALLERY.

THE collection of pictures and Oriental bronzes, carvings, enamels, etc., etc., made by Mr. W. T. Walters has long been famous to connoisseurs as containing some of the most valuable examples of various branches of art, Eastern and Western, known to collectors. It opened last week to invited guests, and has been placed at the disposal of the Decorative Art Society on the Wednesdays of March and April, for public exhibition for charitable purposes. It is, for this hemisphere, unique and likely to remain so, and should, for its pictures alone, be sufficient to make any man famous, not only for its catholicity and the intrinsic value of the individual pictures, but for the number of pictures which have become classic or are known to be the *chefs d'œuvre* of their respective painters. There is Delaroche's small repetition of the Hemicycle of the École des Beaux Arts, the work which more than any other in existence represents the learning of the school of which Delaroche was one of the most illustrious examples, and at the same time the highest success in modern times of distinctly academical work in painting. The excessive (and in our way of thinking, disastrous) devotion rendered to the purely personal and individual qualities of art has brought Delaroche into a comparative neglect, which far more than balances the high popularity he attained in the day when he painted his "Queen Elizabeth," the "Princes in the Tower," and other works which were grateful to common-sense people bewildered by the state to which French Renaissance painters had brought their art, but who were not prepared to accept the romanticism of Delacroix or to consider the *tant soit peu* panoramic and realistic painting of Horace Vernet as true art. Delaroche was a distinct painter of history, but, as fortune would have it, rather a painter of historical ideals than of historical incidents. In the "Death of Queen Elizabeth" it was the type and character of the Queen which he rendered, without concerning himself in the least to procure, after the manner of the restorers of to-day, Elizabethan furniture for the room. He had intellectual rather than artistic ideals to realize, and while his work lacks the *brio* of such men as Delacroix, Géricault, Decamps, and other passionate painters, he had a serene and certain power, and a secure method which was far from weak or even without a certain technical inspiration. He was, in fact, a strong, deliberate painter, who united the best traditions of the Academy to great technical powers and thorough appreciation of the dignity and worth of orthodox Italian art, without being, like Ingres, a devotee to it. In the Hemicycle what imposes on criticism and makes the picture, in spite of its spectacular quality and its being composed entirely of second-hand material, a work of great and true art, is the nobility of pose and action of all the *picturæ personæ*, and the way in which the composer has managed the very difficult undertaking of grouping together an enormous assemblage of distinguished men, of whom none shall be permitted to lose their distinction, none shall be awkward, and none depreciated. Raphael alone, in the "School of Athens," has succeeded as well in such an undertaking, and he had liberty of choice in material, costume, type, and personalities which Delaroche had not. Every figure in Delaroche's picture is a portrait, in accordance with the best authority known, and this alone will show how great the difficulties and the success of the work. The *esthétique* of the work was inevitably sacrificed to a certain extent to such various and rigorous conditions as were imposed on the subject, but is still far from weak, the drawing of the figures being in many cases very beautiful, and the composition of the various groups dramatic and harmonious at once. The Hemicycle is too well known to need description or criticism, but it is a consolation, in the day of a morbid quest of individuality, often running into sheer and mere eccentricity, to look at work which was conceived in the Olympian calm and carried out in the gravity and deliberateness of this. It is a perpetual lesson to our petty, sparkling geniuses, inculcating the value of academic routine and hard unflinching labor.

The collection is rich not only in having good examples of various schools, but pictures which have marked phases of these schools and which belong to the history of art—part of the documents on which our art education has been based. Some of our readers can remember vividly the advent of the Düsseldorf Gallery here, and would recognize a marine, by A. Achenbach, which was one of its most striking pictures, and is now in Mr. Walters's collection. Others will recognize the "Lost Illusions" of Gleyre, the galley floating away into the twilight—visionary barque charged with angelic forms, the illusions of youth and hope, drifting into the land of dreams, the twilight of memory; a pathetic and poetical picture, as remote from the realism of our present art as the Hemicycle. Here, too, is the "Edict of Charles V.," by Baron Leys, one of the few modern painters to whom it has been given to produce a new type in art, and who stands alone among European painters of his time as master of that rare and precious quality in historical painting, the dramatic unity of his assemblages. A certain archaic manner of being, a resuscitated air, as if the company had just left the palace of the Sleeping Beauty, marks his personages and gives the picture the air of an awaking of the Middle Ages; but it derives from the inherent vitality and dramatic conception of the whole that this antique exterior strikes one with such vivid force. The composition seems but a chance market crowd, suddenly struck motionless by enchantment, every one where his own purposes had led him, with nothing academic or artificial in the getting together, but with such coherence as might be expected from a vivid imagination striking out the whole picture instantly. And the huddled, antique town behind has the same air, and makes one wish that Netherlandish towns were now what they once were. Of Isabey, one of the strong, original painters of the picturesque of the French school, antiquated now, having taken his first medal in 1824, there is a fine bit of dancing sea, with a fishing boat painted in a style which goes with that of Dupré, and two drawings which are admirable in their freedom and picturesqueness. Ary Scheffer contributes a drawing for the "Temptation on the Mount," a picture long become classic, in spite of great technical shortcomings, for its singular expression of the spiritual nature in the physical form; and another for the "Dante and Beatrice," of which Mr. C. C. Perkins has the finished picture.

Of Jules Breton a charming little picture shows his happiest vein, "The Close of the Day," two women standing in the sunset light, resting on their rakes in the grain field; and another, better in technique if not in subject, a girl coming down a sloping path with a jar of water, of which the landscape is excellently painted. A Calame, "The Jungfrau," is another of those distinctive forms of art which have in their time had their part in making the landscape painting of the day. Of these the painter painted few and is better known by his lithographs, of which he did many. But no gallery of modern art could be complete which had not a Calame. To Jalabert is credited a picture which is known as widely as any modern religious picture, the "Christian Martyr" of Delaroche, whose the original is (this being a replica commenced by Delaroche and completed by Jalabert); one of those few works of Delaroche's later time when, feeling the shadow of death coming, he began to paint pictures that expressed the deep religious feeling with which he awaited the eclipse—a sweet dead face of a young girl this, floated by the river as she drifts, with her hands tied, down the current, the halo of martyrdom above her head.

A flower piece and fruit piece of Saint Jean are models of true flower painting, and can hardly be surpassed in this vein, modest and naturalistic at its best. Nothing can tell better the transparency of the rose leaf, its fragility, and the moist heart of the full-blown flower, or the delicacy and perfect botanical character of a buttercup, given without laboriousness or loss of any most delicate trait.

Of Millet there is a magnificent picture, the "Flax Dresser," strongly marked by the painter's best qualities, exquisite in color, superb in action, and in execution all that he could make a picture; then a landscape—a wheat-field with a single figure seated, sharpening his scythe, a canvas full of harvest gold; and a group of figures, "potato harvesters," scarcely less fine than the flax dresser, but darker in tone and less simple in composition. Besides these there are several chalk drawings by Millet, most interesting as showing how he approaches his subject.

Of another school is a remarkable drawing by Green, member of the Old Water Color Society of London, "The Derby Day," one of those dramatic mob-pieces, huddles of men, women, and children of all classes and types, of which Hogarth set the example, and which no art has ever handled so well as the English—half literary, half naturalistic.

Of Alma-Tadema, a much overrated man, we are convinced, there are several examples, of which the Sappho, much belauded by English literary journals, is the worst. Alcæus reads to Sappho in a Greek theatre, the marble seats of which are so well painted that the figures make blots in the picture, and are lost and pale before the realism of the mere matter. No great painter ever made such a blunder. A small picture, "My Sister is Not Here," a theme borrowed from that true poet, Hamon, who told it with infinitely greater grace, is the best in painting, and least objectionable in its treatment throughout, of the seven pictures by this painter which Mr. Walters possesses, and is perhaps as good an example of his art as one could have. The "Catullus" is overloaded with detail of the still-life kind, and very much undercharged with animation and dramatic feeling. Of Gérôme, the best of the four (and to our mind, one of the painter's best) is an Arab boy holding two greyhounds in a leash on the desert—everything admirably painted, from the great drifted sandhills to the sharp-nosed hounds and the wind-blown garments of the boy. It looks alive, dogs and keeper alike.

The catholicity of Mr. Walters's collection is not one merely of schools, but of tastes. Difficult indeed must be the man who finds nothing here which satisfies his ideal. An important landscape by Durand, a South American sunset by Church, landscapes by J. M. Hart and H. B. Jones, figure subjects by Darley, Eastman Johnson, and Woodville, portraits by Elliott, Stuart, Stone, and Baker, with statuary by Palmer

and by Rinehart, a sculptor whose brief career, so full of achievement and promise of better, owed its spring to Mr. Walters's appreciation, represent American art, though the example of Church is hardly one which represents the best side of that original painter.

Among the more important works is a small picture by Decamps, "The Suicide," which, though not indicating the great power of the artist, is very remarkable for the massive effect of light and shade and its extraordinary facility of execution. The dead man lies on his cot, with a burst of sunshine falling on his chest and shoulder—a warm golden light, beyond which all is deep mysterious shadow, almost in monochrome, and in vigor of execution and chiaroscuro like a Rembrandt. De Neuville and Detaille are both present in characteristic and good examples. Both are of the class of painters whom we gauge more by what they tell than by how they tell it; truth of representation necessarily takes precedence of style where they cannot walk together, and probably the whole field of art contains no other work so true to the details of war as the works of these two painters. A shade of idealism in conception or treatment, or even a strong idiosyncrasy in the latter, would damage *pro tanto* the realism of such painting, which (not necessarily in the low sense of realistic treatment) is an essential to its success. Even the dash and rapidity of execution, which is, in De Neuville, so marked, helps by sympathy the impression of hurry and struggle which are indispensable as an element in battle-painting. A battle-piece in the deliberate and minute execution of Chavet or Plassan would hardly impress us as an event of actual occurrence, as do the pictures of these painters. Of their master, and the leader, in order of time, if not of talent, of realistic battle-painters, Horace Vernet, there is also in Mr. Walters's collection a picture which had already in 1830 determined the type of battle-painting. That which divides broadly Vernet and his school from the battle painters of earlier times is not the studying of the actual accessories, as against the nude heroics of David, because Benjamin West had already painted a battle in which this was done, but in the utter rejection of all the conventions of composition or treatment; and if an arrangement is invented it is a case of the rule of *ars celare artem*—the study to arrange must not be suspected.

In passing, we wish to put in a protest against the use of this maxim in the universal application generally given. Latin æsthetics were very one-sided, and made little if any distinction between *art* and *artifice*, so that unless we may accept the sense of the dictum as that the perfection of artifice is to conceal the artifice employed, it becomes a complete misleader. True art, in the sense of the quest of the ideal, cannot be hidden—no one could for a moment imagine that a landscape of Turner, a composition of Raphael, or a picture of Delacroix portrayed something that happened *just so*. And the higher and more unusual the character of the art, the further it divides itself from the mock presentment of the thing represented. The noblest composition is that in which the harmonies of line and form are carried to the greatest perfection, though we know that no accidental grouping can approach the best of art, and the color of a great colorist is the more perfect the further it is removed (always being in harmony and pure) from the actual color of nature. If it were necessary to insist further, the aid of the analogies of art may be called in, for as singing (*e. g.*, opera) is not, and cannot be, even in its simplest forms, confounded with speech, so its analogue, color, in its distinctive art relations, cannot be for an instant confounded with realistic painting. In Mr. Walters's gallery one sees this practically in the comparison between the Neuville and the Delacroix which hangs not far away. Delacroix's is also a battle-piece, but one feels in it none of the emotion which the realistic battle-piece is intended to raise. The colorist translates his "combat" into a world where only the emotions proper to art can come: his combatants have a "go" which is fury and dramatic passion, but we know all the time, as we do when we see a scene in tragic opera, that there is nothing coming of it. Illusion, horror, grief, and tears belong to the lower arts, where, only, illusion is possible. Delacroix's work is one of the unfailing line of protests of the ideal against the materialistic tendencies of art. As the ideal is truer than the actual, so too is idealism in art truer than realism—deception is not among its ends.

Another great name in the French school was that of Couture, who contributes to the collection a characteristic picture, allegorical, which was a weakness of the painter, and always a mistake in one in whom the technical ability dominates; but the peculiar system and facility of Couture may be well studied in it, and its technical qualities are sufficient without the allegory, or rather in spite of it. No picture should need explanation in words, and literary art is generally the weakest in its final hold on us, as it is generally the resource of inferior artistic faculties.

Belgian art is represented by Leys, Willems, Van Marcke, Van der Helst, Gallait, one of the most noteworthy of the historical school of the past generation, and Clays; German by the Achenbachs, Becker, Hiddeman, Kurzbauer, Pettenkofen, Preyer, Múnkacsy, Müller; Spanish by Zamacoïs (with a picture which shows all the bloody and repulsive excellence of the realistic art), Jiminez, Fortuny (with a piece of audacity which does not succeed in being artistic, a portrait on a flat vermilion background, chosen evidently for its difficulty, and not overcoming it), and Villegas (by a piece of brilliant, gem-like realistic painting); English by the Green already mentioned; a Wm. Hunt still-life (water-color); a Millais which the artist would never have allowed to leave his study if he cared more for his reputation than for his pocket; Herring; and an ambitious and theatrical picture by the most singularly overrated painter, so far as we know, in England, Briton Riviere. This is called "Syria, the Night Watch," an old lion prowling in the moonlight among some ruins, followed by some quadrupeds of which we could not decide whether they were bears or lionesses, but more like the former—all going their rounds like educated beasts in the circus under a stage moonlight and in a stage ruin. It does not possess one of the great qualities of art, and the circus function of the king of beasts must have been suggested by his restless rounds in the cages of the Zoölogical Gardens. The art of Riviere appeals to that shallow literary sentiment which with the English public is more powerful than any perception of art. To turn from these tame wild beasts to Barye's magnificent drawings of animals, of which Mr. Walters has thirteen, besides, among minor bronzes, a magnificent group in bronze, cast in *cire perdue*, of a tiger hunt, tigers and an elephant, is a lesson in art. Here is nature told in an art which has no need of artifice or extraneous sentiment—water-color used as a master uses it, to tell his facts; subtly modelled, every form told as in sculpture, no pettiness, hide-textures, or attempt at realism; the beast *felt* out, his action unchecked, or his lying in wait full of treacherous preparation clearly evident, easy telling of what is too well known to need petty arts to make it pass muster, or moonlight solitudes to make it terrible.

We do not know to what school Knaus assigns himself, but he has given here one of his happiest pictures, "Mud Pies," with a pleasant landscape and his inevitable hogs, in the distance; however, the children as happy and as jolly as can be, painted largely and in the main so well that one can hardly insist on the conventional and mechanical touch which is the same everywhere and not in all cases appropriate. Here is Schreyer, too, hovering between schools and almost, we might say, between good art and claptrap, always repeating himself with immaterial variations. Here, too, is the best picture we can recall of Fromentin, "Camp in the Atlas," a long line of Éd. Frère's peasant biographies, a Vautier, the inevitable Swiss genre painter, unvarying and equable.

But the peculiar triumph of the collection, if one thing may be singled out, is a group of landscapes, the "Givre" of Rousseau, in which with a rapidity and largeness of execution we remember in no other of his pictures, he has challenged Dupré on his own best effect (and to see how well he has succeeded one must go to the gallery's length to study the picture); a Dupré, "The Old Oak," which meets Diaz on his chosen ground, which Diaz might have been glad to own, and which tries the open landscape subject and method of treatment and execution of Rousseau. Except the last, an "Effect of Autumn," they are all large and are all important pictures. Then there is a magnificent Dupré, dated 1836, which has the quality of a Ruysdael. Three excellent Daubignys will only demand repetition of what we had to say of that painter weeks ago; and who visits the collection will be unfortunate if he misses a pen-and-ink drawing of a mass of trees by Rousseau.

A (Not Quite Harmonious) Symposium of Critics.

From the *Critic and Good Literature's* notice of a 'A Latter Day Saint':

"When a story so worthless in all respects as A LATTER DAY SAINT appears with the imprint of reputable publishers, one hesitates whether to ignore or to denounce it. The book is not only naughty, but silly; not only unjust, unjustifiable, but uninteresting; not only bad, but stupid. The critic who is obliged to read a novel of Zola's does not feel himself seriously contaminated. But the reader of A LATTER DAY SAINT feels contaminated through and through with the low, petty, mean, base views of life that it presents. You may throw the book into the fire, but you cannot shake the dust of it from your soul"

From the *Nation's* notice of the same book:

"Opens happily a new series of American novels. Utters philosophy and sarcasm with a piquancy and good temper which recalls Thackeray's lighter manner without echoing it. The amusement afforded by the frank recital of a career glorious or inglorious, according to the point of view, is heightened in that of the conversion."

From the N. Y. *Tribune's* notice of the same book:

"It is deftly put together, its points are well made, and its implied satire is good. The cold and debased glitter which becomes such a story and such a heroine is well preserved throughout. There is not a little art in the consistency with which Ethel's heart of stone and forehead of brass are kept to the fore."

HENRY HOLT & CO., Publishers, N. Y

The Nation.

NEW YORK, THURSDAY, MARCH 13, 1884.

The Week.

THE decisive vote taken by the Ways and Means Committee on Thursday to report the Morrison Tariff Bill to the House, seems to imply that there is to be no more fooling, and that the Democrats intend to pass it and send it to the Senate at all hazards. If they do so they will have made clear one of the issues upon which the Presidential campaign is to be fought. After electing Mr. Carlisle Speaker on this issue, it would have been fatal to suppress the bill in committee. The people would have taken the party at their own estimate of themselves, and would have said at the polls: "Inasmuch as you have confessed that you do not know what you want, we are sure that we do not want you." Some kind of a bill was as necessary to them as it was to the Republicans in the last Congress. It did not make any great difference what reduction of duties was proposed, but it was indispensable that the promise made should be performed in some way. The bill as it comes from the Committee is not at all startling. It proposes nothing more revolutionary than the Morrill tariff of 1861.

The correspondence about the Lasker resolution has been sent to Congress, and contains nothing of importance which was not already known except Mr. Frelinghuysen's acknowledgment of the return of the resolution. This is simply a dignified repudiation of the idea that the resolution was meant to be anything but a courteous expression of sympathy, and an intimation that he did not see how the presentation of it to the Reichstag could be taken as an endorsement by Prince Bismarck of the political views of Mr. Lasker, but that the Prince's feelings on this point are his own affair. This is really all there is to be said about the matter on our side, and it ought to be allowed to drop here. A quarrel over a man's grave, between two governments, one insisting on expressing sorrow for him to the other, and the other refusing to be sympathized with for any such reason, would be even more ludicrous and unseemly than a similar quarrel between individuals. It is necessary to say this because some people think we ought to resent Prince Bismarck's course by some formal mark of defiance, like the resolutions introduced by Mr. Hiscock in the House of Representatives, and which, we trust, have found their grave in a reference to the Committee on Foreign Affairs. These resolutions declare that the Lasker condolence was "arbitrarily intercepted and returned by a person now holding the position of Chancellor of the German Empire," and intimate that this "person" is a "too powerful subject," "and that he has detracted from the position and prestige of the crown on the one hand, and from the rights of the mandatories of the people on the other," and winds up with a renewed and somewhat fierce tender of sympathy about Mr. Lasker's death. If these resolutions were passed it would convert the mourning over Lasker into something not unlike the fights for the possession of the corpse which now and then take place at Irish funerals.

Whether Prince Bismarck is or is not a "too powerful subject," is, of course, a question for the German Emperor and people to determine; and whether he "arbitrarily intercepted" the resolution is a question for German lawyers and publicists to pass upon. We have nothing to say about either. In sending the resolution to the German Foreign Office, we acknowledged that the Chancellor was the proper medium for its transmission to the Reichstag. If he has improperly withheld it from the Reichstag, it is for the Reichstag, and not for us, to call him to account, and the latest news from Germany shows that those members of the Reichstag who resent his action in the matter are not disposed to be silent about it. In their hands courtesy as well as common sense requires us to leave it. The German Liberals will certainly not be likely to thank the American Congress for undertaking to look after the rights and dignity of the German Parliament, and the German Emperor certainly will not thank us for taking charge of "the position and prestige of the crown," or for trying to prevent Bismarck from encroaching on the Imperial authority.

The abuse of Mr. Sargent by the Berlin press continues, and is undoubtedly officially instigated if not inspired. Combined and persistent attacks of this kind on a foreign minister would certainly not be ventured on in Berlin if they did not receive encouragement from the upper region of the bureaucracy. This of course makes them all the more offensive. Such a mode of getting rid, or attempting to get rid, of an obnoxious minister is something which our Government may well consider as an indication of unfriendliness, and treat accordingly. But it hardly comports with our dignity to expose Mr. Sargent to it in definitely, still less to replace him by anybody in case he is recalled. Keeping a representative at a foreign court is a sign of mutual respect and good feeling. If the mutual respect and good feeling have disappeared, diplomatic relations become as inadvisable as personal intercourse would be between individuals after a serious difference.

Mr. Buckner, of Missouri, Chairman of the Banking and Currency Committee, overrules the legal-tender opinion of the Supreme Court, in an interview published on Friday morning, and declares that not one in ten of the constitutional lawyers of the country will accept it as a correct interpretation of the Constitution. What the constitutional lawyers think about it, however, will have comparatively little immediate practical effect, as neither they nor any one else can reverse the decision; but Mr. Buckner's opinion is vastly more important than it was before the court decided the case, because it is such committees as his, and such members of Congress as himself, who must in future decide whether we are to have a currency redeemable in gold, or a "fiat" currency. He believes that one of the consequences of the opinion will be that the average politician will come to the conclusion that it is a great folly to "maintain a fund of $100,000,000 (coin) to redeem that which needs no redemption, and is money itself (greenbacks)." In other words, it will revive the greenback craze. It does unquestionably give any inflation party, like that which Butler has tried to get up, a weapon that it never had before, and makes it all the more important that Congress should bring silver coinage to an end.

Several constitutional amendments were introduced on Monday in Congress designed to meet the legal-tender decision. Mr. Hewitt's declares that Congress shall not have power to make anything but gold and silver coin legal tender in the payment of debts. This would not prevent Congress from debasing the coin currency. Mr. Potter's takes from Congress the power to make anything but coin a legal tender, except in case of war, but this is open at least to the same objection as the former. Mr. Garland's limits legal-tender Government notes to the sum of $350,000,000, unless an increase is ordered by a two-thirds yea-and-nay vote of both houses of Congress—a measure much more objectionable than either of the others.

Mr. Bayard has gone to the root of the matter, and wishes to have an amendment providing that Congress shall not have power to "make anything but gold and silver coin a legal tender for the payment of debts, nor pass any law impairing the obligations of contracts." That the States should, by the Constitution, be prevented from framing laws impairing the obligations of contracts, while there is no express prohibition against Congress doing this same thing, is one of the strangest anomalies of our Government; and, with the lax system of construction adopted by the Supreme Court, some such amendment may be considered of vital importance. It would, if it were passed, probably prevent not only greenback inflation, but debasement of the currency effected by such causes as the present silver coinage. What the Supreme Court has just decided is that the occasional impairment or destruction of the obligations of contracts between man and man, by means of laws affecting the currency, is one of the sovereign powers incidentally conferred upon Congress by the States. As we cannot reverse the decision, the sooner this power is taken away the better.

On Saturday last the Cotton Exchange of Galveston, by a unanimous vote, passed resolutions urging the Senators and Representatives of the State of Texas to oppose the further coinage of silver dollars on the present basis of valuation. This is the first weighty expression of opinion adverse to silver coinage that has come from any part of the country where the Silver Bill was originally favored.

It happens to come from the quarter which was supposed to be most stubbornly committed to it. The action of the Galveston Exchange confirms our view that the silver craze which prevailed so widely in the year 1878 has substantially died out except in the silver-producing districts, where the Coinage Act is looked upon as a means of making a steady market for the product of the mines. All indications point to the conclusion that the great body of the people in the West and South are now indifferent to its fate, and that any decided expression of the views of the business community adverse to the continuance of the coinage would find no opposing force, and would probably be heeded by Congress. The action of our Chamber of Commerce was therefore most timely and important. If it were generally followed by the commercial organizations of the country, it would be possible to have the coinage suspended before Congress adjourns this summer.

Why should it not be suspended? The evidence is now conclusive that the limit of the demand for silver certificates has been passed —the demand for silver coin ceased long ago—and that the continued operation of the act is simply a tax of $24,000,000 per annum laid upon the people in order to bring financial confusion and disaster upon us at some future time. The singular part of the Silver Coinage Act—that which lifts it into the region of unique and conspicuous folly — is its departure from all the principles of business and the practice of nations, by compelling the Treasury to coin money not called for by any human being or any human want. Science stands aghast at such a spectacle, and it is no wonder that bi-metallists abroad cry out against it as a violation of common sense. In their view, and tested by the principles they advocate, the supporters of our Silver Bill are playing fantastic tricks before high Heaven, the purport and aim of which are beyond human ken.

Mr. Henri Cernuschi, after a long silence, has resumed the agitation of international bi-metallism. The approaching end of the Latin Monetary Union (which continues in force, however, till the close of next year) furnishes the text and occasion for his latest pamphlet. With the field of silver thus circumscribed, and with the suspension of coinage in the United States, which Mr. Cernuschi and all the European bi-metallists desire to see brought about, he thinks that a silver crisis would be precipitated upon England, through her relations with India, which would force that stubborn country to join in a movement for the "double standard." Bi-metallists in the United States generally concur with Mr. Cernuschi in this view, and desire to discontinue the coinage of silver dollars. The reason why they have so little influence in Congress is that the supporters of the Silver Bill are not bi-metallists at all. They do not want a double standard; they do not want a standard that has any gold in it. They want a silver standard, or an inferior standard of some kind. They have a muddled notion that the poor man needs a poor kind of money, and silver happens to be the poorest kind that they see any chance of getting adopted as a permanent currency. Perhaps they will change their plans since the Supreme Court has decided that Congress can make money out of paper in time of peace in any quantity; but at present they are satisfied with silver as the cheapest thing available.

The London *Economist* drops a stone on Mr. Cernuschi, telling him that England would much prefer that the silver output of the world should be sent into the channels of trade instead of being locked up, in large part, in the United States Treasury, an inert and useless mass, doing no good to anybody, but on the contrary preparing the way for great commercial disturbance in the future, when the quantity shall become so great as to burst its bounds. Silver is a valuable metal, and if the United States exported $24,000,000 worth per year more than she does export, her trade would be augmented by that amount, and the countries trading with her, Great Britain included, would be gainers and not losers. The currency systems of the world would not be threatened with the unlocking at some future time of a great mass of silver —like that of Germany a few years ago—to come upon the market like the bursting of a dam. The trade of India, it says, is not disturbed by the fact that silver stands at 51 or 52 pence per ounce, but by the variableness of the price; and variableness is promoted and increased by legislative interference, like that of the United States, with the operation of supply and demand. For these and other reasons England would look with entire satisfaction upon the cessation or suspension of silver coinage by the United States. So far from feeling any nervousness over the calamity presaged by Mr. Cernuschi, she is concerned rather to avoid the greater calamity which our absurd and unnatural treatment of silver is storing up for ourselves and those with whom we have intimate commercial relations.

The statement of ex-Postmaster-General James, before the House Investigating Committee on Wednesday, is likely to become the accepted historical account of President Garfield's attitude toward the Star-route prosecutions. Mr. James makes it clear that Garfield entered upon the reform with a full knowledge of the magnitude of the task, and of the possible consequences to members of his own political party. When the figures which showed the extent of the frauds were laid before him, he was asked whether he favored instituting civil suits for the recovery of the money, or criminal proceedings against the implicated parties, and he replied at once in favor of the latter. When he was told that by following that course he might strike men in high places, might change the Republican majority in the United States Senate into a Democratic majority, and might affect persons who claimed that he was under personal obligations to them for services rendered in the campaign, he reiterated his reply in these memorable words: "I have sworn to execute the laws. Go ahead regardless of where or whom you hit. I direct you not only to probe this ulcer to the bottom, but to cut it out." During the same interview Mr. James says that when the evidence was shown to Garfield, implicating certain men, he displayed great surprise, and added that he had been providentially saved from falling into a trap which had evidently been set for him. This undoubtedly refers to the effort made through Jay Hubbell to get a letter from him pledging his protection, in case he was elected, to the Star-route thieves in return for a campaign contribution, and it is likely to put an end to the persistent efforts which his enemies have been making since his death to prove that the formal response which he sent was such a pledge.

Senator Hoar's committee ought not to have been confined to an examination of the condition of manners and morals of Mississippi. They would find a rich and entertaining field in South Carolina also. There never was a better illustration of the closeness of the relation between the tragic and comic in human affairs than the case of W. B. Cash in that State. He is the son of old Cash, the duellist, and murdered two men in cold blood the other day in Cheraw, and, for some unexplained reason, fled to his father's house. The Sheriff went after him, found him, and took a drink with him, and came away reporting that Cash "declined to be arrested." Hopes were, however, held out that he might at some future time find it convenient to give himself into custody. These hopes are now abandoned, however. Meanwhile, old Cash has allowed the Sheriff to take him to jail, but has "solemnly protested against going to jail and against the whole proceeding," *i. e.*, we presume his arrest and the pursuit of his son. He has, however, as is usual in the case of prisoners of war of high rank, had handsome quarters assigned him, very comfortably furnished, and with an open wood fire, and receives his friends as he pleases. Indeed, no comfort seems to be denied him except his family pistol and shot-gun. The Emperor Napoleon after Sedan was not better treated. We need hardly say that his counsel is suing out a habeas corpus, and that the Attorney-General has been notified. Old Cash has not, it would appear, as yet communicated his present condition to foreign Powers, but this will come in due time. His stronghold is said to be in the possession of the police, and his heir is in the swamp closely pressed, but surrounded by a small band of devoted followers. Two very nice letters have been published, one from young Cash, expressing the hope that Richards, one of the men he had shot, would die, and one from old Cash, saying that had his son failed, he would have killed Richards himself the same day. A stranger social product than this family Christendom probably cannot show. To match it, we should have to go to Albania or the Sudan.

The "Louisiana Republicans," as they are humorously called, held their convention on Thursday, and elected an uninstructed delegation. It is carefully selected, and consists of a surveyor, a collector, a naval officer, a Custom-house clerk, a postmaster, a sub-treasurer, a collector of internal revenue, a deputy surveyor, a district attorney, two Custom-house inspectors, a deputy collector of internal revenue, and an appraiser. There is also a member of Congress, Kellogg, and a State Senator, and one

delegate who is not an office-holder. When it gets to Chicago, there will be few white Republicans left in Louisiana.

As "canvasses" go, we are inclined to think that the one which has been made by the Boston *Traveller*, the organ of the Boston Custom-house, is the ablest of the season. The entire business community of Boston has been interviewed, and not a man found who is not favorable to President Arthur's renomination. The editor says he considers the canvass very remarkable, and calls it "a unanimous verdict." Apparently unmindful of the fact that the "logic of events" in this neighborhood has been shown to point unmistakably to Blaine's nomination, he draws this inference from the result of his investigations: "The logic of the situation is plain. If the Republican party desires to make sure that its candidate will have the cordial endorsement and support of the business class, without which it will surely be defeated, it is easy to see how it can do it."

The American hen has made her first appearance as a public question, and before many months have passed may become an "issue" of as much moment as the American hog. The Central Ohio Butter and Egg Packers' Association have just closed a convention, in which they showed that at least one-half the eggs taken into New York during the past six weeks were from Europe; that in consequence the home trade was seriously injured; and that in the unanimous opinion of the Convention the matter must be laid before the National Conventions and before Congress. In what form the subject is to be presented we are not told, but it will probably result in a request for an amendment to the tariff laws by which the native American hen will be protected from the infernal activity of the pauper hens of Europe. It can probably be shown that the foreign hen is entitled to no mercy, since her greatest activity in production is displayed at that season of the year when her competition is especially damaging to the home-egg industry.

The *Evening Post* prints a letter from the Rev. Theodore L. Cuyler, giving in his adhesion to the Roosevelt High-License Bill, which we earnestly commend to the attention of other Prohibitionists. As we have frequently said, the Prohibitionists are the one body of persons in the State whose hostility to drinking is both persistent and determined, but they cut themselves off from the very powerful coöperation they could and would get from the far larger body of the moderately and spasmodically hostile, by refusing and denouncing everything which falls short of the summit of their desires. In any other practical matter they would individually consider such conduct insane, but somehow, in the matter of diminishing drunkenness, they look on it as the highest wisdom. We have no doubt that a union of *all* the enemies of drunkenness would, in a very few years, drive whiskey, at least, out of politics in this State, and perhaps in the Union, and make dram drinking at bars disreputable and odious; and that this would be an immense moral and social gain, no one who reads the statistics of this (one may say without exaggeration) infernal product, can deny. But our Prohibitionists put it away from them and continue to shout heroically for what they know they cannot get, while the whiskey interest is every day growing more powerful, its hold on universal suffrage in the cities more fixed, and the political activity of grog-shopkeepers more fruitful and impudent.

The remarkable effort of the students of Princeton College to "discipline" their Faculty has ended in most humiliating failure. On the feeble basis of an anonymous letter, they assembled in mass-meeting a few days ago, and resolved that the Faculty were enforcing a system of espionage, which was "cowardly, contemptible, and degrading"; that the officers of the College had been "listening at doors, and gaining admission to rooms under false pretexts"; that a "barber had been questioned by the Faculty and threatened for withholding information"; that a member of the Faculty had attempted to bribe a student to be a spy by offering him a room free of charge; that another member of the Faculty had offered former students of the College a "premium for giving information against men in college"; and, that in view of all these degrading acts on the part of the Faculty, a "thorough investigation" ought to be made by the Trustees "with a view to reforming these abuses." In the same resolutions the action of the Faculty in relation to athletic sports was "disapproved" and a petition made to have it "rescinded." On Friday the students assembled again in mass meeting, and resolved to draw up a formal apology for and retraction of all their charges, having discovered that they were entirely baseless. One of the seniors is quoted as saying that he believes the affair will have the desirable effect of restoring "harmonious relations" between the Faculty and the students, by clearing away unjust suspicions which have long existed concerning the conduct of the College authorities. That is very handsome of him.

There has been no change for the better in the business world during the past week. Much of the sluggishness in the movement of merchandise is attributable to the long continued bad weather; but, after allowing for this factor, there remains a residuum of dulness which finds its expression and most forcible illustration in the export of $7,500,000 gold. This movement signifies that the demand for our breadstuffs abroad has fallen off seriously, and this again implies merely that other countries are underselling us in the British market. Such a condition of things is a new experience for us, but it is one which we seem likely to face for the greater part of the present year, if not longer. Australia reports a surplus of 200,000 tons of wheat for export, which must come in competition with us this summer and autumn. Our own visible supply is 10,000,000 bushels larger than it was at this time last year. Therefore we must look for further exports of gold, but this movement could not come at a time when it would be less harmful, so sluggish is the demand for money here. Railway earnings have fallen off perceptibly, though not largely, and the stock market is extremely dull. Prices have been maintained, however, by the main strength of large operators and by the timidity of the bears, who are still smarting under the punishment they have received in the cornering of Lackawanna and other specialties.

The bearing of the *Alabama* case on the dynamite question does not seem to be very well understood. The *Tribune* on Friday argued at some length that it has no bearing whatever, because in 1861 "there was a civil war in the United States, and the British Government had issued a neutrality proclamation warning the Queen's subjects against equipping vessels for privateering purposes, supplying munitions of war, or doing any act calculated to afford assistance to either belligerent. There is no military rebellion in Ireland against British authority; the dynamite conspirators are criminals plotting in one country against the laws of another, and cannot be considered belligerents under the law of nations, and consequently the provisions of any Neutrality Act cannot be enforced." It is perfectly true that the provisions of our neutrality acts cannot be enforced against the dynamiters, but it is not an enforcement of their provisions that the English want. What they want is the application of the principle on which the neutrality acts are based—that our territory shall not be used for hostile operations or conspiracies against a friendly Power or its citizens—to a new case. A glance at our neutrality acts (U. S. R.S.§ 5281 *et seq.*) will convince any one that while they are intended to provide against armed expeditions, they do not contain anything about "belligerency." If the dynamiters were collecting money to fit out a ship to sack an English seaport they could be arrested and imprisoned. What they are really doing is something designed to produce much the same effect in a different way. The case resembles very closely the Orsini case, in which the plot was to kill the French Emperor; but there was also a very important difference. Then the crime was plainly political, while it is by no means so clear that collecting money in New York to blow up a railroad station in London can be considered anything more than a very base crime against life and property. It is absurd to suppose that the English Government is unaware of these distinctions.

The Emperor of Germany's speech in opening the Reichstag on Thursday foreshadows additional legislation for the benefit of the working classes. Not only is the state to provide insurance against accidents, but also against old age and infirmity. This, the speech says, is intended "to prevent any possible justification" for the socialistic attacks on the existing order of things. This is, however, by far too roseate a view of the socialistic aims. Nothing can well be further from the truth than the notion that the Socialists seek simply security against want or infirmity. They desire also positive enjoyment of the good things of this life while they are at the enjoying age, such as now falls to the lot of the rich, and we doubt if anything short of this will ever satisfy the extremists, who rely on violence for the accomplishment of their ends.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 5, to TUESDAY, March 11, 1884, inclusive.]

DOMESTIC.

THE German Minister in Washington on Friday received the Lasker resolutions with Bismarck's letter, which has already been partly published. It expresses the Chancellor's regret that he felt compelled to return the resolutions.

A copy of a letter on the Lasker incident, dated March 10, from Secretary Frelinghuysen to Minister Sargent at Berlin, was sent to the House of Representatives on Monday. In it he said: "The resolution was passed by the House with the most courteous motives, for the single purpose of expressing sympathy with the corresponding branch of the Government of a friendly nation in the loss of one of its distinguished members, who died within the national jurisdiction of Congress. If any other purpose has been surmised, the indisposition of this Republic, as proved by the history of a century, to obtrude upon other nations the sound political principles upon which our own prosperity is founded should have counteracted that surmise. In the customary order of transmission the resolution came into the possession of his Excellency, who is pleased to explain the embarrassment under which he conceives he would labor by forwarding it to its destination. This position, and the personal convictions to which he alludes, are matters affecting his Excellency alone, and upon them it is not becoming that I make any remark further than to say that it does not occur to me how the transmission of the resolution would have involved an endorsement of the political views of Mr. Lasker. . . . The sentiments of the resolution are now generally known; their merits or demerits can be judged; and its non-transmission officially, as it was intended and claimed on its face to be of friendly intent, while a matter of regret, is not one of concern to either branch of the Government of the United States."

Resolutions were immediately offered in the House and referred to the Foreign Committee, expressing surprise that "it should be, even temporarily, within the power of a single too-powerful subject to interfere with such a simple, natural, and spontaneous expression of kindly feeling between two great nations, and thus to detract from the position and prestige of the Crown on the one hand, and from the rights of the mandatories of the people on the other," and reiterating the previous expression of sympathy contained in the Lasker resolution.

The Senate, on Tuesday, went into executive session on the Mexican treaty and ratified it by a vote of 41 to 20, just one vote more than the requisite two-thirds. This is the Grant treaty which was signed by Commissioners more than a year ago.

The effect of the legal-tender decision was seen in the Senate on Monday, in the introduction of two resolutions for amendments to the Constitution. Mr. Bayard proposed that the States in their Legislatures shall vote upon the proposition that Congress shall have no power to declare any money a legal tender except gold and silver. Mr. Garland proposed an amendment that the legal-tender notes of the United States shall never exceed $350,000,000, unless an increase shall be sanctioned by at least a two-thirds vote of Congress. Both resolutions were laid upon the table in order that the movers may speak upon them. Constitutional amendments with a similar end in view were introduced in the House.

The United States Senate, on Wednesday, passed the bill extending the limits of the Yellowstone Park by adding about 2,000 square miles to the 3,300 square miles of the park. The bill places the park under the general legal jurisdiction of the Territory of Montana.

The Naval Appropriation Bill was passed by the House on Thursday. On Saturday Mr. Morrison (Dem., Ill.) made an effort to call up the Whiskey Bond-Extension Bill, but he was defeated by a vote of 115 to 127.

The Ways and Means Committee of the House, by a strict party vote, on Thursday decided to report the amended Morrison Tariff Bill at once. The Republican members of the Ways and Means Committee will all prepare views on the bill, and submit them as a basis from which a short report against the bill will be made. The purport of it will be that it is desirable that further action shall be postponed until the effect of the last revision is known, and that the country desires rest. On Friday the Democratic members of the Ways and Means Committee were said to be of the opinion that their Tariff Bill could not pass unless they made some concessions to the Ohio Democrats in the matter of wool. The bill was reported to the House on Tuesday.

The House Committee on Civil-Service Reform decided on Saturday unanimously to report the bill abolishing the four years' term for Federal officers. On March 17 the House will be asked to suspend the rules and pass the bill.

The House Judiciary Committee has agreed to report favorably the Bankruptcy Bill. It is identical with the Senate bill, and is the Lowell bill with some of the amendments recommended by the Bankruptcy Convention.

In the Star-route examination, on Tuesday, W. A. Cook, one of the Government counsel in the cases, testified. He adhered to his theory that Guiteau had fellow-conspirators. He said that several days before the assassination Guiteau went into a gun-shop on Ninth Street with three men, and inquired for a pistol; that he (Cook) furnished the District Attorney with an affidavit to this effect, but that it never was used in the trial.

Ex-Postmaster-General James made a long statement before the Star-route Committee of the House on Wednesday. It was carefully prepared and printed. It reviewed at length the general history of the Star-route cases with which the public is familiar. One of its striking features was the statement that on June 27, 1881, W. A. Cook informed him that he feared that something terrible was going to happen to President Garfield. On Thursday ex-Attorney-General MacVeagh testified. He spoke of his relations with Presidents Garfield and Arthur. He said he left the Cabinet because he was diametrically opposed to the political views of Mr. Arthur, and because he could not receive any moral support in the prosecution of the Star-route men. It was evident, he declared, that the Administration of Mr. Arthur was in sympathy with the accused. He acknowledged having advised President Garfield to go slowly in prosecuting such men as Dorsey and Brady, as these men were reported to have letters in their possession which President Garfield would probably not want to be made public property, because there was a split in the party at that time, and to attack men so influential in Republican politics might ruin it altogether. Ex-Senator Spencer, of Alabama, gave interesting testimony on Friday, and A. M. Gibson on Saturday and Monday.

The bill appropriating $1,000,000 for work on the new Capitol at Albany was passed on Friday in the Assembly.

In the State Senate, on Wednesday, the Roosevelt bill giving the Mayor of New York the sole power in appointing heads of departments was passed, after a spirited debate, by a vote of 24 to 7. The negative votes were all Democratic. The bill then went to the Governor for his signature.

In order to render effective this excellent measure, supplementary bills were immediately introduced, among them one terminating on January 1, 1885, the terms of all officers, commissioners, and heads of departments in New York who shall be appointed during the term of the present Mayor, either for a full term or unexpired term. Within ten days after his term begins, the next Mayor shall fill the vacancies thus created. Another bill terminates on June 1, 1885, the term of the Mayor of New York elected in November, 1884, and provides for the election thereafter of a Mayor on the second Monday in April biennially; also for the election by the people of the President of the Board of Aldermen.

A bill to make the City Comptroller elective was introduced in the Assembly, and on Thursday was ordered to a third reading.

The Roosevelt Assembly Committee, which has been investigating the New York city departments, has finished its work. The investigation has been conducted with a view to laying a basis for legislation, rather than to discover evidence upon which to prosecute offenders. There will be probably six bills reported from the Committee. Two will relate to the County Clerk's office, two to the Sheriff's office, and two to the Register's office. The County Clerk and Register will be put on a salaried basis. The bill likely to excite most debate and most general opposition will be one to abolish arrests on processes for debts, this line of prosecution being, in New York city especially, a most fruitful source of abuse in the Sheriff's office.

A reception to the Civil-Service Commission of New York State was given on Friday, in behalf of the Civil Service Reform Association of the city, by Everett P. Wheeler, Chairman of the Association's Executive Committee, at his house, on Park Avenue. A number of distinguished citizens of this city were present.

The new Republican County Committee met in this city on Tuesday night and elected John J. O'Brien permanent Chairman. There were 252 out of 273 delegates present. Mr. O'Brien received 143 votes and Marvelle W. Cooper 109. The proceedings were animated, but no ill feeling was shown. This is a victory for the old Machine element of New York city politics.

The Louisiana Republican Convention on Thursday nominated a full State ticket, with John A. Stevenson, a wealthy sugar planter, for Governor, and a full set of delegates to the Chicago Convention, all but two being Federal office-holders.

The Harvard College Faculty has voted to ask the other colleges for a further conference on the question of regulating athletics. This reopens the whole question, and is a practical yielding to the universal protest of the students against the regulations.

Kenneth Rayner, Solicitor of the Treasury, died in Washington on Wednesday at the age of seventy-six. He had been Solicitor for eight years. In 1866 he wrote a 'Life of Andrew Johnson.'

FOREIGN.

With the usual formalities the German Reichstag was opened on Thursday. The speech from the throne asserts that the chief task of the Reichstag lies in the domain of social and political affairs, and says that the Emperor's wish, which has been solemnly and repeatedly expressed, for the improvement of the condition of workmen, has met with full appreciation on the part of the German people. Among the numerous bills announced is one providing for a scheme of accident insurance, after the adoption of which the Emperor recommends the formation of a system of insurance for the infirm and aged. A bill will be introduced extending the anti-Socialist law for a further period. The speech declares that the foreign relations of Germany are in a highly satisfactory condition.

A fusion of the Secessionist and Progressist parties has been effected. The new combination will be called the German Liberal party. Its programme embraces strict adherence to the Constitution, annual budgets, universal suffrage, secret voting, the payment of members of the Reichstag, the liberty of the press, of public meetings and of association, equality

before the law, religious liberty and perfect equality of all creeds, economic progress, the suppression of State Socialism, just assessment and taxation, with the exemption of articles of consumption. It favors progress based upon allegiance to the Emperor and the Federal Constitution.

In the German Reichstag on Friday there was a great uproar over the Lasker resolution. The President announced the names of members who had died during the recess, Herr Lasker among the rest. Herr Rickert, an Independent, speaking, as he explained, on the order of the day, expressed thanks in the name of Herr Lasker's friends for the numerous tokens of sympathy which had been received. He was particularly grateful to the American Congress for the action of the House of Representatives. The President called him to order. A Conservative member protested against the action of Herr Rickert and of the American Congress. Dr. Haenel, Progressist, said: "When a body like Congress adopts flattering resolutions we should pay as much regard to them as is consonant with parliamentary usages." In the course of further remarks Herr Rickert spoke of Bismarck's "unjustifiable interference." This was followed by great uproar. The Imperial Secretary of the Interior protested against any criticism of Bismarck. Herr Richter, Progressist, maintained that Deputies have a perfect right to criticise the official acts of the Chancellor. Regret is expressed that Herr Lasker's name should have been made the occasion of a stormy debate.

Much attention is drawn in political circles in Berlin to an article in the Cologne *Gazette* denouncing Herr Rickert's attitude in the Reichstag. The *Gazette* says that even Americans are recognizing that Prince Bismarck was justified in refusing to send the Lasker resolution to the Reichstag.

A Berlin despatch on Saturday said: "Minister Sargent has decided not to resign. He will submit the matter to the authorities at Washington." The Berlin *Deutsches Tageblatt* called attention to what it styled Minister Sargent's "incompetence" as compared with his predecessors.

The Berlin *North German Gazette*, Bismarck's organ, in an article published on Monday said: "Had Mr. Sargent, like his predecessors, cultivated the usual confidential relations with the Imperial Government, the Foreign Office would have confidentially directed his attention to the fact that Prince Bismarck was unable to make himself an instrument for conveying an expression of thanks for an opposition policy directed against himself. Mr. Sargent's singular conduct has been so contrary to all diplomatic usage that this confidential channel of communication enjoyed by his predecessors was closed against himself, which fact rendered it necessary to return the resolution through Herr von Eisendecher." It is believed that Bismarck aims at a rupture of diplomatic relations and a tariff war between Germany and the United States, in order to effect the industrial isolation of the former country.

The interview between the Czar and the Emperor William has been arranged to take place in June, at Darmstadt.

The lower house of the Prussian Landtag has rejected, by a vote of 209 to 152, Herr Windthorst's motion to repeal the law abolishing the salaries of Catholic priests.

In Vienna the police have discovered that the Anarchists possess a large quantity of dynamite. Lectures were given last autumn in the workingmen's quarters on the best methods of making and storing explosives. The police made a raid and discovered three laboratories fitted up for making explosives, with large quantities of dynamite.

Legitimist circles in Paris are excited over the fact that on Friday last a package handed in at the railway parcel office at Lyons, and addressed "Comte de Paris, at his hôtel, Rue de Varennes, Paris," was found upon examination to contain an infernal machine.

A circular has been recently issued from the French Ministry of the Interior asking the Prefects privately to advise the Government whether there exists within their respective departments a propaganda in favor of the Comte de Paris. It is taken as an indication of a desire on the part of the Government to expel the Count from France on the very earliest pretext for such action.

The majority of the French Parliamentary Committee who have been examining the question of the importation of American salt meats, are in favor of the Government's proposal to appoint officers to inspect the imports on their arrival in France.

It was reported in Paris on Friday that the French had begun their advance on Bacninh in Tonquin, in two columns under General Millot. Later news represents that the column proceeding from Haidzuong had met the enemy successfully. War preparations in China still continue.

The activity of the English police in searching for Irish-American dynamiters has been unabated. The movements of six men, three of whom landed at Southampton on February 20 from a New York steamer, were carefully traced. It is supposed that six men all told were concerned in the plot, and that they divided themselves into three parties on Feb. 21. Descriptions of the suspected dynamiters were sent to all parts of Europe, and steps were taken to have them arrested at any port. The English detectives at New York have been provided with portraits of suspected dynamiters.

A box containing a galvanic battery and a bottle filled with a dark fluid was found on Wednesday in the railway station at Weston-super-Mare, a watering place in Somerset, on the Bristol Channel.

The British Foreign Office has sent despatches to Mr. L. Sackville West, the British Minister at Washington, in regard to the dynamite outrages. It is supposed that they are intended as a basis for overtures with the United States Government.

The House of Commons, on Wednesday, rejected Mr. Parnell's bill, amending the Irish Land Act, by a vote of 325 to 72.

The Parnellites are irritated at the refusal of the Government to reopen the Irish land question. Their intention now is to begin forthwith a great agitation in Ireland. They will make strong appeals to the Irish to demand an amendment to the Land Act. Subscriptions to a special fund for the purposes of agitation will be opened, and Mr. Michael Davitt's services will be secured.

In the House of Commons on Thursday the Marquis of Hartington moved an appropriation of £380,000 to cover the cost of the Sudan expedition. Mr. Gladstone replied to criticisms of the Conservatives. He said the Government had no intention of assuming the government of Egypt. The troops would be withdrawn at the earliest possible moment. Mr. Labouchere, Radical, moved to reduce the appropriation to £100,000. The appropriation was passed on Monday night.

Despatches received in London on Thursday reported that a thousand men who were marching from El Obeid upon Khartum had been defeated by tribes friendly to General Gordon.

As a result of a British Cabinet Council, Earl Granville, Foreign Secretary of State, has written to Sir Evelyn Baring, first, that the Egyptian frontier, as maintained by English forces, shall not extend beyond the First Cataract; secondly, that Zobehr Pasha, or some other ally of the Mahdi, shall be appointed Viceroy at Khartum, with the understanding that he shall maintain the trade routes between Khartum, Berber, Korosko, and Suakim; thirdly, the Mahdi shall be appointed Sultan of Kordofan, with sovereignty over the regions of the White Nile, Darfur, and Bahr Gazelle; fourthly, that the Red Sea littoral from Kosseir to Ansley Bay, south of Massowah, shall be a dependency of England; fifthly, England will cede to Abyssinia two harborage ports upon the Red Sea, with a band of territory in Southern Sudan.

A despatch from Khartum on Monday said: "General Gordon advises the appointment of Zobehr Pasha to succeed himself as Governor of the Sudan. He thinks that Zobehr, if adequately supported, would dispose of the Mahdi within a year. He strongly denounces the proposed British expedition to reconquer the Sudan, and expresses deep anxiety for the situation at Khartum. Unless the British act promptly in regard to Zobehr Pasha's appointment, the victory of General Graham will, in his opinion, have been useless bloodshed. He does not believe in sending further telegrams."

The Marquis of Hartington, Secretary of State for War, on Monday said that none were more surprised than the members of the Government at the suggestion to appoint Zobehr Pasha Governor of Khartum. General Gordon had been asked for a full explanation.

General Graham and his forces arrived at Suakim from Trinkitat on Wednesday. On Friday, Osman Digma refused to negotiate. He was at Tamanieb wells, urging his followers to fight, and assuring them of victory.

Admiral Hewett and General Graham on Thursday issued a joint decree summoning the Sheiks of the tribes to Suakim, and saying that if they came they would be protected, but if they refused, the fate of Teb would await them. Two chiefs responded, with 120 men. Others were reported wavering on account of the British victory.

The Porte has sounded the Powers in regard to the Sudan. Germany replied that she would not intervene, and suggested that Turkey arrange the matter directly with England. The other Powers made similar replies. In view of this, Musurus Pasha, Turkish Ambassador at London, has requested Earl Granville, Foreign Secretary of State, to use the Sultan's influence in seeking to conciliate the Sudanese.

Earl Granville, British Foreign Secretary, has assured France that England intends to maintain the existing conventions with the Sudan. It is necessary first, however, to restore the prestige of the English name in that quarter. The acts of General Gordon are only partly approved.

Herbert Spencer has declined to become a candidate for Member of Parliament.

Blanchard Jerrold, the well-known English author and journalist, eldest son of Douglas Jerrold, is dead at the age of fifty-eight. He was the author of a number of novels, books of travel, and magazine articles. In 1874 he issued the first volume of his 'Life of Napoleon III.' Of this important work three volumes have been published, and the fourth and concluding volume is in progress.

Mr. Spurgeon, the eminent Baptist preacher, of London, has fallen heir to a large fortune, left to him by the late Mr. Joseph Pool, of Leicester.

A bill has been introduced in the Canadian House of Commons to amend the present copyright law, by placing dramatic authors in the same position as to copyright as other authors. The copyright will be vested in the author and his heirs for fifty years after his death.

Oxford University has decided to grant women the same examination as is given to men.

The existing Cabinet troubles in Italy were still further complicated on Monday by the resignation of President Farini, of the Chamber of Deputies, when a decision of his had been overruled.

The treaty of peace with Chili has been ratified by the Constituent Assembly of Peru.

THE COMMERCIAL AND FINANCIAL SITUATION.

THE London *Economist's* "Commercial History and Review of the year 1883" says that the year has been a disappointing one in almost every department of trade, for although the aggregate volume of business has been somewhat greater, both in quantities and in values, than was that of 1882, profits have been seriously curtailed. Prices of the twenty-two selected articles of food, raw materials, and manufactured goods chosen as a basis of comparison are five per cent. lower than last year, and ten per cent. lower than the year before. Manufacturers, shippers, and wholesale dealers have striven to recoup themselves for their lessened profit on each yard or pound by increasing the number of yards and pounds; but the only effect has been to cause an unusual number of business failures in the latter part of the year, showing that the limits of demand have been reached. Only one great branch of industry has remained in a prosperous state—that of coal production, which last year reached the unexampled figure of 163,750,000 tons, an increase of 7,250,000 tons over the previous year. The price of coal shows a slight advance, notwithstanding the increased output.

The fact that food supplies have been abundant, and that the average price of wheat for the year has been two shillings per quarter less than for 1882, introduces a puzzling element into the situation. It would seem, in spite of all that political economists tell us, as though the world had at last reached a state of "general overproduction," and not merely of disproportionate production. We have been led to believe that since products of all kinds are merely exchanged for each other, there could be no such thing as general overproduction; but here we have the fact before us of an excessive supply of agricultural products coexisting with an excessive supply of manufactured products and an excessive supply of means of transportation, both by land and by water. This condition exists in Great Britain and in the United States. It exists in France and Germany as well. What does it mean? What is the world coming to? Are we approaching a condition where everybody will have so much to sell that nobody can sell anything at a profit?

Not exactly. Yet we can conceive that if everybody's stock of commodities were doubled by a miracle overnight, there would be a great decline of prices and much subsequent embarrassment, growing out of contracts and engagements based upon an altogether different state of things, and that, as regards agricultural products especially, the population of the world would have to be doubled (or nearly so) before the commercial equilibrium could be reëstablished. For although wants multiply with the means of satisfying them as regards most things produced by labor, they do not multiply as regards food. Enough is as good as a feast, and while human desires may take an infinite range in the way of fine houses, clothing, equipage, furniture, travel, books, pictures, etc., they are limited, fortunately, to a nearly uniform quantity of bread and meat per day. If an excessive quantity of these is produced, it can only be taken at a profit to the producer after population has correspondingly increased. That population will increase under such conditions is positively certain, but it cannot increase suddenly.

We in America have been surprised to learn within the past few months that our command of the grain markets of the world has been brought in dispute by the wheat fields of India, South America, Russia, Australia, and Egypt. Whether the increased competition of these countries results from improved means of inland transportation in which we have merely preceded them by a few years, or from exceptionally good harvests occurring simultaneously in many different places, the fact is plain that we have not so good a market to sell in as we have been accustomed to for a long time. When wheat falls below a dollar a bushel in Chicago, bad times are in prospect. Other trades, of course, reap the advantage of cheaper food, but breadstuffs constitute so large a share of our annual production and trading power that any curtailment in the price we receive for our surplus makes us distinctly poorer as a whole. We have that much less on the credit side of the national ledger at the end of the year.

Both our exports and our imports are falling off. The former show a decline of $6,500,000 for the month of January as compared with last year. Nevertheless, our exports for the month are nearly $20,000,000 greater than our imports. Seeing that we have begun to export gold in rather large amounts—$7,500,000 having gone out last week—we must infer that our securities are coming back from foreign investors. This is the only unknown factor in our foreign trade that could account for so large a discrepancy in our trade balance. The other unknown elements, undervaluations of imports and interest on securities held abroad, could not possibly account for it in so short a period.

What we require to recover our ground in the foreign grain markets is cheapness of production. The American farmer may be trusted to find the way out for himself. When he finds that he cannot raise the prices of what he has to sell, he will naturally search for means to lessen the price of what he has to buy. He will not search far till he strikes his head against the protective tariff, and when he does, that wall will fall down as suddenly as those of Jericho fell at the blast of Joshua's trumpet.

THE GRANGER LAW OF TENNESSEE.

THE three United States Judges in the Sixth Circuit have rendered a decision enjoining the Railroad Commissioners of Tennessee from carrying into effect the Granger law of that State. The decision is not final, but the opinions rendered are very elaborate, and must, unless the case meantime develops some new and unexpected feature, be made perpetual in a few weeks. The questions involved are of great interest to "anti-monopolists," and the case shows plainly what sort of Granger legislation *cannot* be enforced. No judges can be expected to draft a scheme of legislation for reformers like the Grangers. The utmost that they can do is to point out the legal and constitutional limits which hedge in and confine such legislation.

The Tennessee Railroad Act, passed only a year ago, vests the Commission called into existence by it with the entire supervision of all the railroads of the State, and makes it their duty to revise all the railroad tariffs. In case they find the rates to be more than a "just and reasonable" compensation, or when the rates amount to "unjust and unreasonable discrimination," against any person, corporation, or place, they are to notify the railroads affected of the changes necessary to reduce the rate to "a just and reasonable compensation" and to "avoid unjust and unreasonable discrimination"; and "when such changes are made or deemed unnecessary," the Commissioners are commanded to append a certificate of approval to the schedule of charges so authorized by them, and the rates thus established are made prima-facie evidence of the reasonableness and justice of the charges fixed by them.

The act does not in express terms command the railroads to adopt these rates, but provides that if they shall exact more than "just and reasonable" rates, or make any "unjust or unreasonable" discrimination, they shall then be held guilty of the crime of extortion, as defined by the act, subject to its pains and penalties, and also subject to a civil suit by any "injured" party for ten times the damages sustained, and a "reasonable" counsel fee. Further, the Commissioners are charged with the duty of "investigating" and "determining" whether any of the provisions of said act are violated; and whenever satisfied that violations have occurred, they are peremptorily commanded by the statute to bring suits for every such violation against the offender in the name and for the benefit of the State. And if upon the trial the jury believe, from the testimony adduced, that the charges are "unjust and unreasonable," or that they "amount to unjust and unreasonable discrimination," their verdict must be for the State, and they are required to assess and return a penalty of not less than $100 nor more than $1,000. Finally, the Legislature added the remarkable provision that rates charged by any railroad should not be deemed extortionate if it appeared that the net earnings would "not amount to more than a fair and just return on the value of such railroads, . . . to be assessed for taxation."

There are various objections to this legislation. It leaves it entirely to a jury to determine what the profits of any railroad in the State ought to be. One jury might think a four per cent. basis for punishment a fair and just one; another might think a railroad free from all guilt until it got about six per cent., and these different rules might be applied by different juries to the same road. As to "discrimination" also, it fixes no legal standard whatever, but leaves it for any jury to determine whether a difference in rates is discrimination, without any legal guide, and, in fact, gives the jury the power no jury can ever have, to first define and then punish the crime. The act also conflicts with the Fourteenth Amendment, and is objection-

able because, by giving prima-facie weight to the rates fixed by the Commission, it sweeps away the ordinary presumption of innocence of all persons accused of crime, and substitutes for it one of guilt.

Besides all this, the judges hold that the act is contrary to the Constitution of the United States, as being a regulation of inter-State commerce, and this point will no doubt be strongly contested when the case gets to Washington. The Supreme Court may perhaps avoid considering it, but the deliberate opinion of three Federal judges that Granger laws are beyond the scope of State legislation, is entitled to great weight. If it holds, all the Granger laws will be swept out of existence except such as are entirely local. We have no space to discuss at length Judge Hammond's opinion on this point. The decision ought at least to bring to an end all such wild attempts at local interference with the railroad system of the country as that attempted in Tennessee.

DIVORCE FRAUDS.

THE mock-divorce exposure in Brooklyn has led to the dismissal, by the judges, of Law, the clerk through whom the trade in divorce was carried on. He was not dismissed, however, until he had been brought up on a charge of forgery. His connection with the case has attracted less attention than it deserves. Not only is he charged with deliberately conniving at a constant abuse of the laws of the State, but with forgery of judicial records—an offence, in a man holding such a position, of the blackest sort, especially when it is done, not in a single instance, under pressure of some great temptation, but habitually, from week to week and month to month, and carried on as a trade too, for money. The worst of it is, that there are a great many courts in the United States constantly exposed to just such accidents. Clerks of court, in the States where the elective system has been thoroughly applied to the administration of justice, are politicians or henchmen of politicians, and owe their appointment and their hold on their office to "influence" of some sort. They often remain clerks a short time, and regard a clerkship as a place like any other which is to be used for their private purposes. The judges themselves are apt to feel a good deal of dread of their clerks and deputies, as persons who are put into their court by the same power to which they owe their own seats on the bench, and over whose tenure of office they have very little control. The old feeling that the clerk is an officer of the court is very nearly gone. No one can have read the testimony recently given here by Mr. Keenan, the County Clerk, or Mr. Trainor, one of the Surrogate's clerks, before the Roosevelt Committee, without perceiving that these officials do not regard themselves as clerks in the employment of the Surrogate or the Supreme Court, but of what they call "the people." A great Clerk like Keenan speaks of himself as distracted from the duties of his office by "politics." A little one like Trainor explains how he is forced to support himself by charging illegal fees. This, it must be remembered, is the account given of clerks by themselves. If this is the picture they are willing to put forward of the working of the system, we know what opportunities there must be for all sorts of wickedness behind. A fraudulent divorce lawyer would find in some obscure and dishonest clerk a natural ally; and if the accounts published of the Brooklyn divorces be correct, he is an ally who may carry on a business in fraudulent divorces for a long time without much danger of detection. Owing to the present connection between politics and the courts, judges dislike excessively to interfere with their clerks, or to behave toward them as if they suspected them, and the result is that they actually often do not know what is going on in their own courts. The routine of business falls into the clerk's hands, and he really has much of the power of the court in his control. Law appears to have acted as the court throughout. He was referee, judge, and counsel for both sides all in one. Nevertheless, the judges seem to have acted with great deliberation, even after Law was actually held for forgery. Judge Pratt is quoted, for instance, as refusing to state whether Law had been removed or not, as it might "prejudice the minds of the public."

Of course there are no statistics to show how much divorce business in the State courts is fraudulent, and there never will be; but with such opportunities for fraud existing all over the country, it is safe to assume that a considerable part of it would come to an end if the judges knew how their courts were being used; and the Brooklyn divorce cases really constitute a powerful argument in favor of the transfer of the whole business to the National Judiciary. The superiority of the latter for such a purpose lies, of course, in the fact that both judge and clerk have in the United States courts a responsible tenure, and the clerk stands in awe of the judge instead of the judge having in a certain sense to look up to the clerk. The clerks in United States courts do not come from the class which supplies us with Laws, or even with Keenans or Trainors; and the use of a Federal court and its seal to carry on a "divorce mill," instead of being something that we might fairly expect, would be a very improbable contingency. This is an aspect of the divorce problem which those who are considering the advantage of a national law ought not to overlook.

THE IRISH TROUBLE IN A NEW SHAPE.

THE late discussion in the House of Commons on Irish affairs, though no discussion on Irish affairs can now have much novelty, had at least the merit of taking a new form. The contest between the Parnellite or Nationalist party and the Orangemen, which raged in Ulster during last autumn and winter, was now fought over again in the House of Commons. It was even extended, for it became a triangular duel, in which Mr. Parnell attacked not only the Orangemen, but also the Government, for having unduly favored the Orangemen by prohibiting Nationalist meetings, while in the House of Lords the spokesmen of the Orangemen proposed to censure the Government for punishing the Orange leader, Lord Rossmore, by removing him from the magistracy. Each of the cases presented against Lord Spencer's action had enough plausibility to make it worth while to state them a little more in detail.

Mr. Parnell's charge was, that the Irish Executive neglected its plain duty of securing, by the employment of force, the exercise of the right of public meeting. His party had resolved to carry on a political campaign in Ulster, with the view of winning over other counties there as they won Monaghan last summer. Nearly half the population of Ulster is Roman Catholic, and therefore prima facie inclined toward the Home Rule party. In some districts the Catholics are in a large majority, and it was in these districts that most of their meetings were summoned. There has been little agrarian outrage and no political assassination in Ulster during the last few years, so there seemed no likelihood that Home-Rule meetings would produce crime; the rather as crime, whether agrarian or political, has almost ceased through the whole country during the last sixteen months. The Nationalist leaders had not talked sedition at the first meetings they held, nor was it alleged that the advocacy either of further land reforms or of a separate Parliament for Ireland could be deemed seditious. They were, therefore, strictly within their constitutional rights in proposing to address the people on these subjects, and apparently entitled to the protection of the police against those who should attempt to disperse them by violence. To prohibit their meetings, therefore, only because Orange mobs threatened to attack them, was, they insist, not only to favor the Orangemen, but positively to encourage the lawless attitude of that faction, who would be able to suppress political agitation by the simple expedient of summoning their bludgeon men to appear at the spot selected for a Nationalist meeting. Mr. Parnell and his friends further urged that Orange offenders had been let off easily by the Government; that violent language held by Orangemen had passed unnoticed by the authorities, when in the mouths of Nationalists it would have led to a prosecution; that Lord Spencer himself had, by staying at the houses of Orange landlords on his last visit to the North of Ireland, gone far to represent himself as a friend to that party.

On this last charge it may be observed that as nearly all the persons of rank and wealth in the North of Ireland are Tories, Lord Spencer's only alternative would have been to refuse every social invitation, and lose part of the utility of his visit by staying only at hotels. However, there is some measure of truth both in the charge and in that of tolerance for Orange offenders. The Irish Executive has always kept itself in such close social relations with the landlord class that it has incurred the suspicions of other parties. The unpaid magistracy is filled by landlords, nearly all of them Episcopalians and Tories. The paid magistracy and subordinate officials generally are related to and socially dependent on this same land-owning caste, so that they are inclined to be more tolerant of heated language or violent acts spoken or done by its members or in its interest. This is a part, and not the smallest part, of the permanent difficulties of

Irish government. And in this particular instance an impartial observer will conclude that more severity might properly have been exercised toward the Orangemen, and thereby a more emphatic proof have been given of that desire to hold the fair balance with which the Irish Government may be credited.

The case of the Orangemen, which they presented in Parliament much more temperately than they had done in the Irish press or on their own platforms, was shortly this. These Parnellite agitators, after having convulsed the South and West of Ireland, and produced a crop of crime which it needed the most stringent legislation to check, have invaded the one part of Ireland which has hitherto been free from crime and loyal to the union with Great Britain. If we let them inflame the simple peasantry of the northern counties, who are no doubt largely Roman Catholic, not only will the seeds of outrage and sedition be sown, but England will believe that Ireland is unanimous n desiring separation, and we, the loyal population, the industrious, peaceable, intelligent Protestant population, will be the sufferers, for England will be the readier to abandon us to the mercy of this ignorant and passionate majority. It is all very well to talk of legitimate and constitutional agitation, but these so-called Nationalists did not agitate legitimately or constitutionally in the South and West: they silenced all opposition by intimidation and boycotting. Here in the North they may not venture on threats, but they will mislead the poorest class by falsehood, and stimulate them by ferocious invective. We must stop them before they have got a head. We must let England see that we too are alive and exerting ourselves, and that here at least loyalty is stronger than sedition. We, too, are entitled to hold our meetings, and to hold them at the same times and near the same places as the Separatists, for this is what makes the protest effective. Did not Mr. Gladstone himself once tell us that we had not spoken out as was our duty, that we had not given the Executive the support it had a right to expect from law-abiding men? So, if the Government cannot be absolutely neutral, it ought rather to incline to our side, since we are the loyal and meritorious subjects, they the apostles of crime and disunion. Instead of this the Executive has chilled our zeal, has dismissed Lord Rossmore from the magistracy for an indiscretion pardonable in a young man indignant at the disturbers of public tranquillity, has thrown away the help which we have sought to render.

The assumptions or fallacies in this argument are easy to discover. The landlords of Ulster are fighting more for their own incomes and their own ascendency than for the general weal of the kingdom, while their followers among the workingmen of towns like Belfast are animated by the old hatred of faith and race against Romanists and Celts. It would have been possible to oppose the Nationalists without endangering the public peace by collisions of armed men, and thereby forcing the Government (since it could not send large bodies of soldiers and police wherever a meeting was to be held) to prohibit meetings. However, the pleadings of the Orangemen have been received with some sympathy by English opinion, not so much that it favors them as that it dislikes and distrusts their opponents. The spectacle of those who practised or tacitly approved intimidation in other parts of Ireland complaining with injured innocence of its employment against them in Ulster, has amused the British public, which in its rough way thinks they have been rightly served, and will not closely scrutinize each act of the Irish Executive. It trusts Lord Spencer's honesty and admires his firmness. Even the House of Lords was unwilling to adopt the resolution offered by Lord Dunraven blaming the Government for removing Lord Rossmore, since this would have weakened the Viceroy's authority; so the resolution had to be withdrawn.

AN ARCHÆOLOGIST IN TUNIS.

JERBA, February 14, 1884.

THE island of Jerba, from which I write these lines, is certainly one of the finest and least-explored sites of the Tunis Regency. We may count on the fingers of one hand the number of *literary* travellers who have devoted some attention to it, and, until quite lately, Jerba, the Homeric Lotophagitis, was a *terra incognita* to archæology and art. The principal reason for this is the insecurity which prevailed in the southern parts of the Regency before the French occupation, and the complete —or nearly complete—lack of regular means of communication. The French and Italian steamers have only recently begun to land passengers at Jerba, on their road from Sfax or Gabes to Tripolis. Indeed, if it were not for the commercial transactions brought about by the presence of a small French garrison at Jerba, it is doubtful whether any steamer would stop there at all. The northern coast of Jerba is extremely shallow, and the large steamers of the French Transatlantic and Italian Rubattino Companies are obliged to lie at anchor at a distance of six miles from Houmt-Souk, the capital of the island. The sea is never very rough, being broken by the neighboring shoals; but when the wind is fresh, passengers and goods must be landed on an old pontoon, anchored about five miles off from the shore, until the small boats and barges can approach and land them. In the good season and with little wind, sailing vessels take at least three hours from the steamer to the harbor; and when the tide is low (the sea rises nearly six feet in the minor Syrtis), there are no other means of landing than the shoulders of the Arab fishermen. This, of course, is a great nuisance, which prevents many tourists from visiting Jerba, and puts a disagreeable obstacle in the way of commerce. If we may believe the 'Odyssey,' the charms of the Lotophagitis land—identified with Meninx or Jerba from the days of Alexandrian scholarship—are powerful enough to induce travellers to forget their native country. The truth is, nowadays, that it is more easy to get to Jerba than to get out of it. When the steamer coming from Tripolis is in sight, a fresh northern breeze may prevent the boats from reaching it in time, and many French soldiers have had to wait a fortnight before being able to leave the Homeric island. A tourist who decides upon visiting Jerba must have time to spare and no lack of good temper; if he fulfils these two requisites, he will certainly not regret his time, money, and patience.

Situated in the western gulf of the minor Syrtis, Jerba is at but a little distance from the southern shore of the Regency. The modern port of El Kantara, corresponding to the ancient Meninx, capital of the Island in Greek and Roman times, is five miles off the African coast; and the sea is so shallow in the whole gulf which separates Jerba from the mainland, that Roman engineers had built a causeway between Meninx and the opposite shore. This road or wharf still exists to a great length, and is sometimes used by Arab caravans, in spite of the ruined state in which it has been left for many centuries. The natives call it *Urek el-Jemel*, or the road of the camel. A wealthy merchant of Jerba has determined to rebuild it—the expense of the work, amounting to £10,000, to be covered by the fees levied on the travellers who use the road during the ensuing ninety-nine years. If the Government of the Bey gives its assent to this enterprise, we may expect a large revival of Jerbian commerce and prosperity, so greatly impeded by the shallow waters all about the island. It is, in fact, nearly impossible to dig a channel or to build a wharf in the port of Houmt-Souk; and when once Jerba can be easily reached by land, passengers and goods will willingly abandon the sea route, which is subject to the many inconveniences I have already noted.

One of my friends and myself, sent by the French Ministry of Public Instruction to explore the ancient sites of Jerba, have passed about a month in the island, and visited nearly all the villages it contains. Houmt-Souk, the capital, is a neat little place, lying between the sea and beautiful gardens. The population amounts to 3,000 souls, the whole island containing about ten times as many. The inhabitants are chiefly Arabs, Berbers, Maltese, and Jews. They are a very peaceable lot, entirely devoted to agriculture, industry, and the commerce in sponges, quantities of which are daily sold on the market-place of Houmt-Souk. The sponges of Jerba are very large, but much inferior in quality to those about Sfax and Tripolis. In the last few years, prices have greatly risen, although the annual export has increased; and thus the sponge fisheries have become a source of wealth for the Jerbians, who are in commercial intercourse with some large firms at Marseilles. The other articles exported from Houmt-Souk are chiefly olive oil and woollen plaids. The oil is most abundant, the whole island being covered with olive trees, some of which are many centuries old. No olive tree is allowed to be cut down without the leave of the Khalifa, who never gives permission if the tree is looked upon as sound. The woollen plaids are of a particular design, with large red and green stripes; they are much in favor among the Arabs, although a European traveller must find them rather vulgar and coarse. Jerba also contains about 10,000 palm trees, yielding an abundant crop of dates; but the climate is not hot enough to make them rank among the better ones of the Regency, and those of the Jerid and the Nefzaoua, on the frontier of the desert, are far superior to them in size and in flavor. Every reader of the 'Odyssey' knows that the great attraction of Jerba, in the Homeric age, was the fruit of the lotos, "the fruit as sweet as honey," which made the stranger forget his fatherland. Herodotus says that this fruit was like the date, but nothing further is known about it. Botanists have tried to identify it with the jujub, the fruit of which is certainly not worthy of the Homeric praise above alluded to. A more recent and more satisfactory hypothesis is the following: One of the names for the date, in Arabic, is *rotob*, a word which does not seem of Semitic but of Libyan descent, and may correspond to a forgotten term in the most ancient language of Northern Africa. The Homeric word *lotophagi* would be a corruption for *rotophagi*, the phonetic change of *r* to *l* being supported by many

instances, and brought about in the present case by the analogy of the Egyptian *lotos*, a plant well known to the Greeks of remote times and figured on their most archaic pottery. We may well suppose that the Jerbian dates were superior, thirty centuries ago, to what they are now, and resembled those of the Jerid, which are the sweetest fruits in existence. Thus, the hypothesis of a small climatic and phonetic change seems to explain fairly enough the verses of Homer, which have puzzled so many commentators, and naturally occur to the mind of every scholar landing at Jerba.

The island, taken as a whole, is a large oasis, very little raised above the level of the sea, covered with palm, olive, and orange trees, extending over more than twenty square miles, and well furnished with wholesome water. The climate is wonderfully temperate; no grave cases of malarious fever have ever occurred. In the very height of summer a light breeze, rising from the sea, makes the heat very supportable, while the opposite coast is nearly uninhabitable for Europeans. If Jerba is yet a poor country, with a very scanty population, the reason of it is only to be sought in the exactions of the Tunisian tax-gatherer, and that general mismanagement which seems a natural plague in the Levant. French occupation will certainly bring about a revival, especially when the state of things shall have been settled by the complete suppression of the Capitulations. A few Jerbian farmers have already planted vineyards, which yield large crops and a very strong white wine. The Arabs understand nothing about the culture of vineyards, and still less about the making of wine; but when the extent of the vineyards shall have increased, Sicilian vine-growers will come to Jerba and instruct the natives in the art they lack. Within ten or twelve years a good part of the Regency will be planted with vines, and the *crus* of Jerba may certainly be reckoned among those which will be the most in favor among European drinkers.

The day may come when Jerba, with its good water, its shadowy palm trees, and its admirable climate, will be a privileged retiring place for the sick and tired of the Old World. French military doctors have already thought about establishing there a sanitarium for the troops of occupation, so greatly tried by the tropical climates of Gafsa, Gabes, and Ras-el-Oued. There are naturally no hotels at Houmt-Souk; but the French garrison is established in a vast Arab *bordj*, or castle, where a room, a seat at the mess, and good hospitality are readily offered to every stranger who comes to Jerba with another purpose than commerce. After having passed there a few days in most agreeable company, we expressed the wish of undertaking excavations at El Kantara, which, as I have already said, is the ancient town of Meninx, and lies on the southern coast of Jerba, twenty miles distant from Houmt-Souk. Captain Laferrière, the commander of the French force, gave us an escort of twelve men, furnished with all the necessary implements for digging. The road from Houmt-Souk to El Kantara is really charming, and goes through a long succession of gardens, not an inch of the soil reminding us that the Libyan deserts lie very near. The last village we crossed, called Houmt-Sedouikh, afforded us an agreeable surprise: a Maltese, who keeps a little bar, could speak some words of French, and enabled us to talk with the Khalifa, a very intelligent Arab, who promised us all possible means of subsistence, which he accordingly forwarded to us on the following day. Three miles further on we reached El Kantara, where there exists but a small Arab *bordj*, beside the ruins of Meninx. Happily, a French battalion had encamped last year on the same spot, and the officers had built a little house, or rather a room, which relieved us from sleeping under our tents. The next morning before sunrise our soldiers were at work among the ruins, and we could take a view of the whole plain.

The ruins of Meninx form a vast field of marbles and mosaics, extending over more than two miles in length and half a mile in breadth. In no place, not even in Greece, have I met with such a profusion of precious marbles cut into gigantic blocks. Two Roman emperors, Volusianus and Trebonianus Gallus, were proclaimed at Meninx, and it is probable that they did for that city what Gordianus did for Thysdrus, where he assumed the crown. The central part of the site is occupied by the remains of an immense marble palace, which must have ranked, in splendor and magnitude, among the finest of the ancient world. The soil is strewn with columns of red and green marble, some of them ten yards long and one yard in diameter. The cornices and mouldings are also of an extraordinary size, and of careful, though rather frigid, workmanship. Eleven statues, representing emperors and victories, all of violet or yellow marble, were lying among the ruins. We contrived, with great pains, to have them set upright, and were able to take some good photographs of them. Unfortunately, all the heads were missing, and our excavations could rescue but fragments of them. The palace is surrounded with Roman houses, which are sometimes in an extraordinary state of preservation. Nearly every one of them is adorned with a pavement in good mosaic; some walls are still covered with stucco, where the remains of mural paintings may be traced. At the western end of the town is a fine Byzantine church, from which a large baptismal font, in white marble, was taken away last year by a French cruiser, and now lies in the arsenal at Tunis, waiting to be shipped to Toulon by some man-of-war returning home. After having taken a number of photographs and copied several Roman inscriptions, we drew a plan of the whole site, and returned to El Kantara with a few specimens of sculpture.

Our next expedition, accompanied by twenty men and a lieutenant, led us to Hadjim, a little port on the south side of Jerba, where we saw an old Arab captain, formerly the English consular agent, who begged me to translate for him a letter from the Foreign Office which he had been unable to decipher. The letter, signed Earl Granville, was a polite *fin de non-recevoir*, opposed to certain demands of the old man. I told him that Earl Granville sent him his compliments—which was not untrue—and he proudly enclosed the paper in a small box along with testimonials given to him by French officers. The captain sent for a large lighter and had us taken over to Bou-Grara, on the opposite coast, where we spent some time in excavating. Bou-Grara, a quite desert and very insecure place, is the present name of the ancient Gightis, a flourishing Roman town, where Guérin and Wilmanns, the only two archæologists who have visited that part of the Regency, had already discovered a few inscriptions. We began digging at the four ends of the forum, and were soon rewarded by the disclosure of several large pedestals with dedicatory inscriptions, of three statues more than life-size, and especially of a fine head of the Emperor Augustus, veiled as a pontiff. Bou-Grara is certainly a place where large excavations should be undertaken, for we hardly spent an hour there without discovering an inscription or a piece of sculpture. As our time was limited, and the provisioning of our escort gave some difficulty (Bou Grara is thirty miles distant from the nearest village), we abandoned in four days that interesting site, and re-embarked on our lighter. The wind was very unfavorable, and instead of reaching Hadjim at sunset, we spent the whole night on board, and were obliged on the following day at noon to land at Kelela, another Jerbian port, which occupies the site of the ancient Hares. Our friends in Jerba were getting anxious about us, and on setting foot on the island we were surrounded by the sheikhs of the neighboring villages, who had hastened to bring us our luncheon, which we were greatly in want of. The same day, or rather the same night, we got back to Houmt-Souk with our archæological booty. I will not trouble your readers with details concerning our further rambles in Jerba. Let it be enough to say that on leaving Lotophagitis we feel truly sorry, like Ulysses and his companions, not on account of the sweet lotos, but in consideration of the sweet climate and kind hospitality, which, to the same extent, we are sure not to find at Zarziss and on the frontier of Tripolis, whither the course of our archæological journey now obliges us to direct our steps.

SALOMON REINACH.

THE DEBATE ON SUDAN.

LONDON, February 20.

THE long debate on the behavior of the Government in Sudan has at last reached its close in a division taken last night. It has been extended two days beyond what was originally contemplated, nominally on the ground that so large a number of Opposition members desire to expose the faults of the Ministry. The Ministerialists, however, insinuate that the real motive for the dilatory tactics of their foes has been the hope that the news of some further disaster at Khartum or on the Red Sea coast might arrive before the division was taken, and thereby a number of wavering members be detached from the Ministry. Contrary to the usual course of things, the conflict which began in general excitement and alarm on the part of the Liberals, became every day less and less animated because its issue became more and more certain. The silence of the Government, the misfortunes which had befallen the Egyptian forces on the Red Sea coast, the anxiety with which General Gordon's perilous journey across the deserts of Nubia to Berber on the Upper Nile and thence to Khartum was watched, produced a general sense of anger among the Conservatives, of despondency among the Liberals, of irritation and restlessness in the general public. The Ministry themselves were not free from apprehensions as to the result, because they knew that some of the members for small boroughs who support them, desiring to postpone a redistribution of seats which will extinguish those boroughs, would be glad of a good pretext for deserting their standard; and the fact that the fall of the town of Sinkat and slaughter of its garrison was announced just when the debate began, struck every one as a bad omen. If Tokar, the other beleaguered stronghold, were also to fall—most people said—or if anything untoward befalls Gordon, the Ministry may prepare to quit Downing Street.

Sir Stafford Northcote opened the battle with a speech less vigorous and combative than the occasion called for. He is a very able man—perhaps the ablest man, after Lord Cairns, that the Conservative party possesses—full of knowledge, a close reasoner, a fluent speaker, with great administrative tact and long Parliamentary experience. But he is not forcible in debate, and least of all forcible in attack. He did not charge like a man who expects to break the line, and, indeed, seemed to damp the ardor of his followers. In listening to him you usually get the impression that he feels the weak points

of his own case, and has not that oratorical passion, that gift of working one's self up into an emotional pugnacity, which enables some great advocates to speak better against their convictions than with them. Mr. Gladstone, who followed immediately, was, on the contrary, in his best mood. He reminded one of a horse long kept in a stable, and happy at last to breathe the air of combat and thunder over the field. Contrary to expectation, he was cheerful and even playful, seeming to welcome the direct challenge of his policy, and demanding its approval as one who felt himself so clearly in the right that he could not doubt the issue. Sir Stafford Northcote's resolution of censure blamed the policy of the Government for its "vacillation and inconsistency." Mr. Gladstone set himself to show that, whether right or wrong, it had at any rate been consistent; and here he carried his party with him, because every one felt that if he had erred, it was in having clung too tenaciously to a complete abstention from interference in the affairs of Sudan, and in having insisted on the abandonment by the Egyptian Government of its attempt at reconquering the revolted provinces. Neither this, however, although a fair argumentative point to score, nor his defence of the questionable parts of his whole Sudanese policy, seemed to affect his audience so much as the spectacle of the orator himself, displaying in his seventy-fifth year a force and fire, an ingenuity, and readiness, and fervor such as none else in England has displayed within the memory of living men. The contrast between the brilliance of this sun, almost touching the horizon which will soon conceal him, and the pale rays of his enemies and his friends alike, told upon those who watched him, and produced a rapid rally of personal loyalty. Yet, like most of Mr. Gladstone's speeches, there is little in this one which deserves to be read a month hence, or which will convey to posterity any notion of the sort of power he exercises. His words, and even his arguments, sink toward the level of ordinary oratory when separated from the voice and manner, from their aptness to the particular occasion, and from the whole impression of this wonderful personality.

There was little remarkable in the further course of the debate, though a skilful and minute defence of the Government was offered by Sir Charles Dilke, and a powerful review of the whole position, dwelling on the difficulties which the Ministry had to encounter, but not sparing their mistakes, came from Mr. Goschen. The bad habit which has sprung up of extending discussions over more days than they used to occupy hours, makes the later stages of our debates tedious. In this instance, however, a new agency has been called in by the Opposition. Encouraged by the universal sympathy of the fashionable world, and indeed of the mass of the richer and professional classes in London, they have got up public meetings, to denounce the cowardice and inhumanity of the Cabinet in suffering the town of Sinkat to be captured and its population slaughtered, and in so long delaying to send succor to Tokar. At these meetings, held one in the Guildhall of this city (which the Lord Mayor, who is a strong Tory, granted for the occasion), and the other in the West End, vehement invectives against the Ministry were delivered to excited and sometimes uproarious audiences. In London, with more than 4,000,000 of people, it is of course easy to get the largest room filled by an audience sympathetic with any cause which has some vigorous leaders, so that the mere fact of meetings being held and resolutions carried, might not seem to mean much. In this case, however, there can be no doubt that strong feelings do exist, not only among the Conservatives, but also in that class which, while considering itself Liberal on certain domestic questions, is in favor of a spirited, and possibly even aggressive, foreign policy. The dinner-party view of politics is warmly condemnatory of the Government; and it is natural that the political leaders who find London society with them should believe that the country also is so. In the great cities, except Liverpool and Sheffield, the Liberal party holds an easy majority; but in the centre and west of London, Toryism is even more distinctly superior, so that this is the best place in which to overawe a Government, and impress the country by popular demonstrations.

That these demonstrations produced no effect on the votes of members was partly due to the heated and extravagant language which the leading speakers used. To call Mr. Gladstone the Moloch of Midlothian, and describe his Cabinet as wading knee-deep in blood, because they had not relieved the garrison of Sinkat, is not the best way to move that middle section of our public which holds the balance between parties. Moderate Liberals who censured the inaction, as they think it, of the Ministry, or its too obstinate adherence to a line of conduct which events were daily making less and less possible, began to forget these faults in their disgust at the intemperance with which the Tory skirmishers assailed the Government. The question became less and less a question whether the Cabinet had taken the wisest course, and more and more a fight between the two great parties, in which of course party ties asserted their strength. Those who had been disposed to vote against the Ministry asked themselves whether, after all, they would mend matters by admitting Lord Salisbury and Lord Randolph Churchill to hold the reins of power, and extricate us from this very perplexing situation. They found it the easier to adhere to their old banner because the language now held by the Government, as well as their more recent acts, indicated a change of policy, and the adoption of a clearer responsibility not only for the settlement of the Sudan question, but also for the administration of Egypt proper. This, they said, is after all the main thing, and if Mr. Gladstone will but do this, we had better leave the threads in the hands which now hold them.

Fortune, too, aided the Government. No further bad news arrived, but instead telegrams announcing General Gordon's arrival at Khartum, his enthusiastic welcome by the population, his own growing confidence in the issue of his mission. It also came to be seen, as the debate lingered on from day to day, that the excitement of London society was not shared by the North of England, or by Scotland, where the whole Liberal party, even if some of its organs gave but doubtful approval to the Government's past action, remained faithful to Mr. Gladstone. These causes made it plain that he would obtain a sufficient majority, so that the only question of interest came to be, how the party of Mr. Parnell would vote. Their general attitude is that of hostility to all ministries, Tory and Liberal alike, since their avowed object is, by playing off one English party against the other, to hold the balance of power, and thus extort concessions. These considerations suggested their voting with Sir Stafford Northcote. On the other hand, there was the fact that the present Ministry is pledged to bring in a bill largely extending the franchise in Ireland, a bill by whose help they expect to win several seats, and this bill would, of course, be thrown off for years if the Ministry were to fall. It is a pretty illustration of the position of this group of members, showing how insignificant to them are all questions except so far as they affect those Irish aims on which they are bent, that the question of the substantial merits of the Ministerial policy was not expected by any one to influence their votes. As some of them had expressed a hearty sympathy with the Mahdi now, as with Arabi Pasha previously, and as the Government was blamed for not having resisted his troops and assumed a more absolute control over Egypt, they might seem to be far more in accord with Mr. Gladstone than with the Tory leaders. But their decision, taken, it is said, by a narrow majority in their own council, was to vote with Sir Stafford Northcote against the Government, and so they voted accordingly. Notwithstanding this addition to the hostile forces, the Ministry obtained a majority large enough (312 against 262) to reinvigorate their party both in Parliament and in the country, and I believe that they stand better now than when Parliament met. The diminishing weight of the House of Lords has received a remarkable illustration, by the fact that the vote of censure on the Government which they passed over one night's debate, was hardly noticed even by the organs of the Opposition.

THE PROSPECT OF A PREMIUM ON GOLD.

TO THE EDITOR OF THE NATION:

SIR: A few obvious considerations may perhaps tend to quiet the nerves of those who apprehend an early return of the premium on gold, and a depreciation of our currency to the silver standard, as a result of enforced silver payments by the Treasury. In the first place, a premium on gold cannot be maintained except where there has been an overissue of currency not convertible on demand into gold. Till we have not merely enough, but more than enough, of greenbacks, national-bank notes, and silver or silver certificates in circulation, to occupy the whole field of currency, there must be some gold in use as money, and so long as this is the case there can be no real premium on gold. Such a premium could only result from a depreciation of the currency; and in order to have depreciation we must first have inflation.

To assume that we could have a depreciation of the currency down to the silver standard, occurring simultaneously with a great contraction of the circulation by the withdrawal of gold, is to forget one of the fundamental laws governing the value of money. If the 500 millions of gold now included in the currency were withdrawn, without being replaced by an equal amount of some other form of circulating medium, not only could there be no depreciation of the remaining currency as a result, but every dollar left in circulation, of whatever material composed, would rise greatly in value. Instead of a premium on gold, we should have a sharp decline in prices, a great falling off in the importation of foreign goods, and a large inflow of gold from abroad. Conceivably it is possible for the holders of gold in any country, at any time, to produce these effects by a combined movement. It was as possible with us in 1883 as it will be in 1885. Our protection against it lies, first, in the fact that effective combination among so many cannot be maintained; and, secondly, in the fact that there would be nothing to gain by the movement. The only use open for the gold withdrawn from circulation would be exportation to pay for imported goods; but, in the nature of the case, there could be no demand for gold for exportation. The present situation, we must bear in mind, differs widely from that of 1862-3. We have now no flood of

irredeemable paper pouring out upon us. The greenback is fixed in amount and redeemable in coin. The national-bank circulation is contracting rather than increasing. The only source of inflation at present is the coinage of silver dollars, and this, fortunately for us, is kept down to two millions a month.

The situation, then, is briefly this: We have at present upwards of 500 millions of gold in use as money. That our currency, this gold included, is not much, if at all, in excess of our proper needs, may be inferred from the fact that the gold, having largely come to us from abroad, has shown so marked and decided a tendency to remain with us. Now, towards replacing this gold, and thus releasing it, or expelling it, from the circulation, the Treasury has only 35 millions of available silver—that being the amount it holds in excess of the outstanding silver certificates. This leaves a balance of 465 millions to be made up by the slow process of coining. At the rate of two millions a month, nearly twenty years would be required for the operation. In the meantime the currency must include some gold, and while this is the case there can be no premium. But once the point is reached at which the supply of currency other than gold is sufficient to do the whole work of currency, gold will disappear and will begin to command a premium. But even then we shall not at once "drop to the silver standard." This will not occur until, by the further coinage of silver, the whole volume of the currency has been inflated some 12 or 15 per cent.—a process which, at the rate of two millions a month, would occupy five or six years more.

It may be thought by some that the 143 millions of gold belonging to the Treasury ought not to be regarded as forming part of the currency, especially when the Treasury is said to be threatening us with payments in silver. But this view leaves out of sight the currency obligations of the Treasury. There are in actual circulation about 300 millions of greenbacks, which the Treasury is bound to redeem in specie on demand. With gold at a premium, not much less than a reserve of 300 millions in silver would be required to protect the gold in the Treasury from the public. The present available reserve of thirty-five millions would be brushed aside in a few days Now, at the rate of two millions a month, the Treasury would require eleven years for coining the needed addition. But in order to accomplish the task it must, in the meantime, not only abstain from forcing silver on the public, but must even carefully hoard every new dollar coined. Under these circumstances there would of course be no inflation going on, and so no tendency towards a premium on gold. In order to produce that tendency the new silver must be paid out; but if paid out, it could no longer serve as a screen to protect the Treasury gold from the public demand; so that even after the Treasury had accumulated 300 millions of available silver, we should still be saved from the worst effects of the silver malady by the absence of inflation.

The case is still further strengthened by taking into account the circulation of the national banks. This amounts at present to about 346 millions. The holders of these notes are entitled to call for the redemption of them in some form of legal tender—that is, in gold or in silver dollars, or in greenbacks— and the Treasury is charged with the duty of carrying the redemption into effect. In case of a premium on gold, the Treasury could not ward off the onslaught on its gold reserve, and on the gold reserves of the banks, by paying out the redeemed greenbacks in redemption of the bank notes; for all greenbacks so paid out would be instantly presented for a second redemption in specie. Evidently, then, for this purpose, the Treasury is in the same position as it would be if the greenbacks outstanding were 646 millions instead of 300 millions. The only difference is that it would have the aid of any silver in the hands of the banks. But this brings us back to the point that, until there are some hundreds of millions more silver dollars in existence than there are at present, we are in no danger of a premium on gold. Any attempt on the part of the Treasury or the banks to hoard gold from the public may undoubtedly cause disturbance and inconvenience of other kinds; but it will certainly fail, under present conditions, to send gold to a premium and keep it so.

The advent of a premium on gold is therefore as yet a somewhat remote contingency. Of course this is no argument in favor of maintaining the present absurd and injurious law relating to the coinage of silver. The full effects of the silver evil will be slow in making their appearance. But this very slowness will make them all the more crushing and difficult to remedy if they should unhappily be allowed to come upon us. With a mass of perhaps 800 millions of highly inconvenient and, in relation to other civilized countries, uncurrent silver dollars on our hands, with our paper depreciated to the silver standard, and our gold exported as merchandise, the task of restoring our currency to a sound condition would be one of gigantic proportions, and would prove both costly and difficult to an extent which can hardly be estimated at present. And even though these worst consequences are still somewhat distant, every day that passes leaving the present law unrepealed, removes us one step further from a perfectly healthy currency, and increases the difficulty of the task which, sooner or later, must be faced.—Yours very sincerely,

S. M. Macvane.

Cambridge, Mass., March 3, 1884.

MORMON LIFE.

To the Editor of The Nation:

Sir: For a whole generation this has been one of the many vexed questions before the American people: How shall Mormonism be managed? What shall be done to end the crime and scandal which centre in the Great Salt Lake Basin? There, sure enough, is the seat of a hideous monster, but how shall a hook be put in his nose, and he be subdued to good morals and manners? Nothing is more certain than that before the difficulty can be solved, its real nature must be accurately understood. The terms of the problem must shape the course of the solution. The nation at large, and even editors, statesmen, and clergymen, in other matters well informed, are here deplorably ignorant. Too often rumor and gossip with regard to Utah affairs have passed for settled fact, while blind prejudice and heated passion have prompted tongues and pens. There is no small ground for the conviction that the action of Congress two years since was based upon a misapprehension approaching the ludicrous. Such facts as the following are patent to every non-Mormon resident of Utah.

The growth of Mormonism and its present strength are apt by alarmists to be much overrated, and some would have it that the nation is as much imperilled by the Latter-Day Saints as by the hordes of the queued and almond-eyed from over sea. Last fall the telegraph, multiplying the number by ten, made Mr. Cannon say that 23,400 converts had been baptized in six months, and so the statement went forth everywhere. But the total of immigration to "Zion" from the Old World since 1840 is only some 86,000. For the first decade the annual average was 750, for the second decade 2,000, for the third and fourth 2,500, while for the last five years it has ranged from 2,500 to 3,000. At the death of the "Prophet" in 1844 the number of his adherents was estimated at 150,000, but so terrible was the scourging that followed that less than 50,000 were found to make the memorable exodus to Salt Lake. As for the large majority they lived and died in the "Babylon" of "Gentile" regions, satisfied with the taste they had had of Mormon good things. And now, after forty years, not more than 100,000 are found in all the Rocky Mountain Territories, including the lukewarm and children (all of eight and over are members of the Church). Then the saving clause of the system is found in the ease with which its yoke is cast off. Probably 50 per cent. of all who are baptized apostatize sooner or later. Thus eight of the eleven "witnesses" fell from grace within ten years, and were cut off, and also a majority of the original "apostles," while of some 35,000 converts gained in Sweden between 1850 and 1882, 11,000 repudiated the faith *before emigration*.

The mass of the people in Utah are not monsters, horned and hoofed, but, on the contrary, are honest, industrious, well-meaning, conscientious, and as virtuous as the same intellectual and social grade of English or Scandinavians in Wisconsin or Minnesota. Belonging by birth to the lower classes, and living upon the rough frontier, they are rude, as a matter of course, and exhibit much of the animal; but licentiousness, drunkenness, and deeds of violence are far from common. Of patriotism, it must be confessed, there is general and serious lack. And this, in part, because born and reared under other ideas and institutions; in part because their coming to this land was far less to become Americans than Mormons; but chiefly because the church which holds and rules them is essentially and utterly non-American and anti-republican. Civil government, whether State or Federal, is ignored as both useless and usurping. The chief end of man in Utah is to stand by the priesthood and obey it in all things.

Polygamy is by no means universal, and may fairly be called exceptional in Utah society. There are more men than women by about 6,000. The Commissioners could only find 12,000 or 15,000 whom the Edmunds bill disfranchised on account of plural marriage. In some communities the number of polygamists is quite large, and in others very small. In one county, out of eight bishops only two have more than one wife. In a town of 1,500 inhabitants but six families are obedient to the "celestial law," and in another of 800, but two. Multitudes hold to the theory with great zeal and tenacity, but nevertheless in practice are monogamous, and numbers are in open opposition both in tongue and deed. A meeting was lately held in a certain settlement, at which, on the part of the elders of Israel, there was great lamentation and weeping over the fact that the rising generation of girls was so depraved as to be determined to have a whole husband or none, and one heart-broken septuagenarian possessed of only seven or eight marital partners declared, with heaving breast, that if he should need a young wife in addition, he knew not where to look for the same. Evidence abounds that this abnormal and obnoxious institution has passed its hey day and is in the sere and yellow leaf. The climax of the abominable was reached twenty-five years ago when polygamy was the staple of exhortation and command. Now it is held to be only for the few, the *élite*, the chiefs; is the reward of special virtue, and constitutes the badge of aristocracy. The maximum of wives, too, grows steadily less. Once ten or fifteen were not uncommon, but now three or four are held sufficient to enable

one to rise and reign in the eternal worlds. The female fashions of the times make it impossible to clothe so many, and the settled judgment of Christendom makes itself felt more and more. No doubt, though, polygamy will continue to be preached for years. In spite of the Edmunds bill the Endowment-house week by week receives such as desire to be "sealed for eternity." And this will not cease so long as women, all things considered, prefer plural to single marriages.

The situation in Utah steadily improves, has changed vastly for the better within twenty or ten years The nadir was reached in 1857 during the days of the dreadful "Reformation," that veritable reign of terror, when the Mountain Meadows massacre was committed, when "blood atonement" was in vogue, and apostates and other foes were "used up" by the hundred at the command of the priesthood. But, fortunately, in the nature of things such frenzy as marked that period was of short duration. All concerned in those excesses were appalled and disgusted. In 1863 the Federal army took up permanent quarters at Camp Douglas near Salt Lake City, and activity in mining operations soon followed, and a large influx of Gentiles. In 1869 the Pacific Railroad was completed, bringing Mormonism face to face with the nation: and in the same year occurred the "Godbeite Movement," a determined and most vigorous strike for free speech, free thought, and public decency in the conduct of church affairs In 1877 died Brigham Young, whose iron will for thirty years had been undisputed law, and whose resistless grasp had been on the minds and hearts of the whole people to fetter, and crush, and deform. Since then other railroads have been added, and miners by thousands throng the mountains, every one a fearless and outspoken hater of ecclesiastical arrogance and impertinent meddling. An untrammelled press has conquered a large place. Christian schools and churches are rapidly multiplying, so that there are now to be found 90 of the one, with 175 teachers, and 35 of the other, with 40 ministers. Person and property are as safe from violence as in any of the States or Territories. Life is tolerable, at least in many communities, for Gentiles, and even for apostates from the Mormon Church. But the case even yet is bad enough, and in any other Territory would be counted unendurable. And the evil and curse centre in the facts which follow.

The most characteristic and essential feature of Mormonism, as well as that in which it is most hostile to ideas most cherished in the nineteenth century, and especially in this nation, is found in its dogma of an inspired and infallible priesthood, in daily and direct communication with the Most High, uttering his voice, and clothed with power and authority to rule and fashion in all things whatsoever, whether religious, social, business, or political. Joseph Smith founded a kingdom of God, literal, temporal, material—no mere paltry affair of repentance, faith, baptism, and the like, but including all civil functions from the greatest to the least, and be they executive, legislative, or judicial. All officials, Presidents, Governors, Judges, Congressmen, and the like, to hold legitimate power must be chosen by revelation, and must be of the holy priesthood. *Vox populi, vox dei*, is a damnable and heaven-defying heresy. The people are to have no voice—at least the law of the kingdom is *vox dei, vox populi, i. e.*, let God speak (of course through Taylor, Cannon, the Twelve, the High Priests, etc.), and let the ballot box only echo and register the theocratic decree. Here is political bossism with a vengeance. Nor is this merely a dogma for the theologians to argue over and to slumber harmless in musty books, but it is living and mighty. Under just such a régime is every Latter-Day Saint living to-day, and is taught to call it perfect freedom. This is the crucial test of Mormon orthodoxy. As polygamy was an afterthought, an addendum, an excrescence, so the law concerning it may by the priesthood be repealed; but this absorption of the state by the Church, this preposterous and unbounded assumption of right to absolute and universal rule, is certain to continue to the last. Of course there is no room for political parties, for how can there be an opposition when Heaven directs the ballot? The Mormon vote always has been, and in the nature of the case must always be, cast solid. It was for following the hierarchy in this thing that this people came to such bitter grief in Missouri and Illinois, and their very presence became intolerable. It was political hate and fear, far more than religious, that cost the prophet—originator of this precious scheme of monarchy and despotism—his life. And hence, also, it is that between the church-state set up in Utah, and institutions counted most sacred and dear by every American, an "irrepressible conflict" exists and must continue until the Mormon priesthood yield, or else our 50,000,000 conclude to adopt the Utah idea. It was Brigham's famous dictum that he had full right to meddle and manage in every particular "from the setting up of a stocking to the ribbons on a woman's bonnet"; and some 8,000 or 10,000 men in and about Salt Lake are Brighams in small, and in this particular follow hard after him. And what is the nation going to do about it?

H. M.

SALT LAKE CITY, March 3, 1884.

CHARLES READE ONCE MORE.

TO THE EDITOR OF THE NATION:

SIR: In *Harper's Monthly* for March, 1884, appears the first instalment of a story called "The Picture." This story is one of a series preparing by Charles Reade for that periodical—a series to be followed, as the advertisement announces, "by sketches of Bible characters in which Scriptural heroes will be presented as seen by a student of human life and nature"—and of the Eighth Commandment. Now, this story, "The Picture," has either been borrowed by Charles Reade from the owner of it, for the sake of its better "setting," or has been purchased by him from the owner, with an occult understanding that the editor of *Harper's Monthly* and the credulous American public shall in the transaction be laudably cozened. Whether bought or borrowed, the plot, the essential phases of dialogue, and the accessory descriptive padding, to the minutest detail, are abstracted from "The Portrait in My Uncle's Dining-room," a story which appeared in No. 11 of the *Month*, London, probably 1869; and in *Littell's Living Age*, November 6-November 27, 1869. "The Portrait in My Uncle's Dining-room," with other short tales, was published by Littell & Gay, 1870, in an octavo volume, paper. The same story, in company with "The Straw-cutter's Daughter," was afterward issued by Sadlier in a 16mo volume.

On first examination there is no clue to the authorship of the original story, since the *Living Age* vouchsafes merely the information, "From the French." But Sadlier's edition puts "The Portrait in My Uncle's Dining-room" into covers with one of Lady Georgiana Fullerton's novels, and the American Catalogue classes it twice among her writings. Further proof of the authorship of the original story there has not been time to acquire, and it is not essential; but there is in "The Portrait" a certain delicateness of handling, a rare neatness in plot, and a general sadness of tone that remind one vividly, from style alone, of Lady Georgiana's "Ellen Middleton," a novel of which Lord Moncreiff has said: "It leaves as complete a sense of wretchedness and discomfort on the reader's mind as the writer could have desired." Moreover, we know that Lady Georgiana Fullerton, whose father, Earl Granville, was Ambassador to France in the reign of Louis Philippe, wrote several of her novels in French, among others "La Comtesse de Bonneville," 1857, and "Rose Leblanc," 1860. It is more than probable, then, that "The Portrait in My Uncle's Dining room" was one of this order, and that it was first translated into English when published in the *Month* and the *Living Age*. From the style of Charles Reade's adaptation, we are inclined to believe that "The Picture," whether it be the outcome of buying, borrowing, or unconscious memory, is based upon the English rather than the French original.

This adaptation, so far as it is published, adopts substantially the same characters and relates precisely the same leading incidents. One should, however, bear in mind that in Mr. Reade's allotropic modification of the story, the original substance has been considerably condensed as well as vilified. The following coincidences may prove entertaining, if not instructive, subjects:

ORIGINAL VERSION.	MR. CHARLES READE.
1. Vases of Japan China, always filled with fresh flowers, decorated the corners of the room, and each frame of the gray wainscoted walls was enlivened by a landscape painting of some historical scene. . . . On the walnut sideboard stood some ancient pieces of plate of exquisite workmanship. . . . A portrait which Dom Gérusac had hung up over the pier-glass of the chimney-piece.	1. Chinese vases five feet high, and always filled with flowers, guarded the four corners of the room; vast landscapes were painted on the walls and framed in panels of mellow oak: many pieces of curious old plate glittered on the sideboard. . . . Over the mantel-piece of the dining-room hung a picture in an oval frame.
2. "And that frame, Frederic, is a very pretty one, too." . . . "That portrait," I exclaimed, "oh yes!" "Dear me, no, not the portrait," he cried. "It is . . . in very bad drawing." . . . The little finger which my uncle had found so much fault with had disappeared.	2. "I bought her for the frame, you may be sure." . . . "But oh, uncle, what is that compared with the divine effigy?" "Divine fiddlesticks," said he; "look at her little finger, all out of drawing."
3. The Ambassador was actually riding up to the door on a small ass, . . . his whole suite consisting of a peasant, who carried his portmanteau.	3. Arrived with military precision an elderly gentleman (the ambassador) on a mule, with a small valise carried by a peasant.
4. Babelon came to me, . . . looking aghast. "Mercy on us, sir, what *are* we going to do? Marion has been working so hard since yesterday that now she is taken ill, and has just been obliged to go to bed." "Well, you must wait at dinner," I said; "go and put on your best gown and a clean apron."	4. Suzon met me in wild distress. "Oh, M. Frédéric! What shall we do? Here's Catherine been ailing this three days, and . . . the master ordered a great dinner and she would cook it, . . . and now she is lying down on her bed, more dead than alive." "Poor thing," said I. "Well, you must . . . put on your best cap and wait."
5. "Do you know where that portrait came from?" . . . "Yes, Monseigneur, my uncle bought it at D—— in an old curiosity-shop."	5. "May I ask how that portrait came here?" "Oh, yes, Monsieur le Comte," said I, "my uncle bought it in a bric-à-brac shop."
6. . . . this parterre was a raised platform. . . . This little miniature hanging garden of Babylon.	6. Upon the parterre, which was like the hanging garden of Babylon.
7. It was a wooden figure. . . . "A sportsman with his gun in his hand—" the Baron answered. "No, papa, it is a shepherd keeping his flock and leaning on his staff." Mdlle de Malpiere said, . . . and she put the little figure in her pocket. "I think it is the image of some saint," the Baron *opined*.	7. And he drew out the little wooden figure. "It is a sportsman," said the Marquis "leaning on his gun." . . . "You are blind," said Irène; "it is a shepherd leaning on his staff." And she took the hideous statuette and put it in her pocket. . . . Mdlle. Donon *opined* it was a saint.

There is scarcely a paragraph in "The Picture" in which such amusing coincidences with "The Portrait in My Uncle's Dining-room" as the preceding do not occur.

CHARLES MILLS GAYLEY.

UNIVERSITY OF MICHIGAN.

[Another correspondent (*Nation*, p. 189) has already likened "The Picture" to a novel from the French, "Where Shall He Find Her?" (N. Y., 1867)—perhaps originally iden-

tical with "What the Papers Revealed," in the *St. James Magazine* for August, 1867, as pointed out by a correspondent of the *Literary World* for March 8 ?—Ed. Nation.]

THE PRESIDENT AND THE SOUTHERN REPUBLICANS.

To the Editor of The Nation:

Sir: In the last number of the *Nation* I observe the following language:

"Nothing seemed less likely in either of those years" (1872 and 1876) "than that an Administration candidate for the Governorship could be defeated in New York by a majority of 192,000, or than that Civil Service Reform Acts could be passed both in Congress and in the State Legislature, or than that Mr. Chester A. Arthur would be found commending such laws, *and at least pretending to execute them*," etc., etc.

I have been a constant reader of your excellent paper for fourteen years, and have delighted in its righteous denunciations of political abuses which have afflicted the country during that period, and admired its able advocacy of important political reforms, many of which have been incorporated in the legislation of the nation; but is there not quite a departure from its customary fairness when it accuses the President of "pretending to execute . . . the Civil Service Reform Acts"?

In this connection, it is also asserted that—

"The Southern delegates, in fact, occupy the same position in a national Republican convention as the Southern Democratic vote does in the Electoral College. Both are 'solid,' and one is about as much of an evil as the other. *President Arthur's strength in the Convention will be made up mainly of this solid Southern contingency*, which will not be able to give a single electoral vote for the Republican Presidential candidate."

Taken together, the language quoted creates the impression, whether so intended or not, that the President is not discharging his duties relative to the enforcement of the Civil-Service Reform Act, and that his failure to do so is occasioned by his desire for a renomination. You do not say so, but this may be read between the lines.

It must be remembered, that in most of the Southern States the Republicans constitute such a hopeless minority that, politically speaking, there is but one thing to engage their attention—a Federal appointment. When appointed, the creature of the appointing power becomes the friend of the Administration; and so long as there is no law to prohibit the person appointed from using his official authority and influence to coerce or control the acts of his acquaintances and others in glorification of his official creator, this natural exhibition of gratitude should be expected. It is true, an office should be regarded as a public trust and all that; but where an office-holder's choice is between two candidates, both of whom are regarded equally worthy, is it not natural that he should incline to the one who bestows the appointment? So, although the Southern Republican delegates may be solid for Mr. Arthur, it does not follow that he has encouraged it by any neglect of his official duty.

If the Republican delegates from the South are solid for Mr. Arthur in the next National Convention through the manipulations of the Federal office-holders in that part of the country, then responsibility for it will, in a great measure, lie with the friends of reform; for there is nothing in the Civil Service Reform Act of January 16, 1883, to prohibit any person in the public service from coercing the political action of any one, except as his moral sense may be influenced by the mere declaration "that no person in said service (public service) has any right to use his official authority or influence to coerce the political action of any person or body." There is no penalty in the act for the violation of this provision.

If the evil which you deplore as coming from so "thoroughly mercenary a brigade" as a solid Southern Republican delegation, is wrought by a disregard of that provision of the Civil-Service Reform Act just referred to, then the earnestness of the friends of reform, and the sincerity of the President, may both be thoroughly tested by so amending the Civil-Service Reform Act of 1883, at once, as to make the penalties of that statute applicable to the provision just quoted, for the time has not yet been fixed in any of the Southern States for the holding of Republican delegate conventions.

Very respectfully,
E. W. Bagby.

Paducah, Ky., March 2, 1884.

THE LAW OF THE GOEL.

To the Editor of The Nation:

Sir: In your discussion (No. 973) of the new doctrine of "Goelism," you identify the blood-revenge of "barbarous" tribes with the Mosaic law of the goel. A careful examination of the statutes will show, I think, that the Hebrew law was as much in advance of the common practice of blood-revenge as our system of trial by magistrate is superior to any method of private revenge, and that it gave Israel comparative immunity from the bloody strife of other nations. The six cities of refuge for involuntary homicides (Greece and Rome seem to have provided these too); the restriction of liability to vengeance to the person of the offender; the designation of the nearest of kin as the goel—all distinguish very markedly the Mosaic law from the practices of the surrounding nations. Among the Bedouins—and they are fair specimens of "barbarous tribes"—the right of revenge belonged to any relative of the slain to the fifth degree upon any relative of the slayer to the same degree. It descended also to the latest generations, and was annulled only by money compensation.

But even without these important distinctions, the authority of the Mosaic law should not be brought to such use to-day as Rev. Mr. Finch proposes. It was given to Israel only, and that for a special purpose. A universal application was never sought or even permitted. And while it was as light to the darkness of heathenism around about it, under the clear light of Christianity it becomes darkness itself, without obligation for even the most devout Christian.

A complete *reductio ad absurdum* of Mr. Finch's argument would be had by quoting any one of a dozen statutes which rest on the same basis as the law of the goel. He admits that Israel's was a "ruder" age than ours, yet "goelism" has no more place in the civilization of to-day than circumcision, or the penalties of contact with dead bodies, of bodily pollution, or the prohibition of shaving the beard, etc., etc.—I am, sir, Yours, respectfully,

W. S. P. Bryan.

West Virginia, March, 1884.

[We do not see how any system in which private revenge plays any part in the punishment of crime can be compared to a system like the modern one, from which private revenge is wholly excluded. It was the exclusion of the individual from all share in redressing his own wrongs in cold blood which constituted the first great advance in criminal jurisprudence. Blood revenge is and has always been regulated among all barbarous peoples, as well as among the Jews; but as long as it was tolerated at all, no really marked progress was made, and the law was not really triumphant.—Ed. Nation.]

CHINESE IMMIGRATION AGAIN.

To the Editor of The Nation:

Sir: Permit an old subscriber of the *Nation*, who "does not hold an office, who does not hope to run for one," who thinks "he does not belong to the loafing class either of the broadcloth or homespun kind," to let Mr. Edward Cunningham know what his own—the writer's—conclusive argument against unrestricted Chinese immigration is. I regret Mr. Sam Wiggin overlooked this argument.

I voted against Chinese immigration conducted as it was before the Restriction Act was passed, because I was convinced that it was a wholesale importation of contract labor, enforced here, on the part of the importing companies, by subjecting the relatives or other bailsmen of the imported coolies left in China to slavery for any breach of contract on the part of their relatives here, the Chinese Government recognizing such claims and enforcing them in case of need.

This was my conclusive argument. How many of the voters against Chinese immigration (the vote on this coast was almost unanimous against it) have voted on the strength of this argument alone, or on the strength of the two advanced by Mr. Wiggin, or on the strength of any or all of the three or more, I do not know, but think it to be irrelevant as long as the alleged third point—contract labor based on bondage of bailsmen—is not refuted, or proved to preclude in this particular case the disadvantages which history and political economy have connected with industries carried on by *ergasteria*.

"C. R. C." has probably seen Sir David Wedderburne's elegant article, "The Dutch in Java." I wish he would kindly inform me how he would induce the Chinese to stay in this country for good *without* a change in the Constitution of the United States.—Yours very respectfully,

H. S.

Girls' High School,
San Francisco, February 16, 1884.

["H. S." had to go far afield to find a reason for voting against the Chinese. There has been searching investigation in China by English Commissioners, and the result, as regards California, is that the emigration thither is as free as any that exists in the world. There has never been a particle of proof brought that bailsmen in China are subjected to slavery for breach of contract on the part of the emigrant in California, in any publication we know of. If a contract exists it is a money contract, and the penalty would be in money. "H. S.," therefore, means to say that men are sold for debt in China. Seeing that the charge is contrary to any known usage of the Chinese, those who advance it ought to prove it.—Ed. Nation.]

THE POSTAL NOTE.

To the Editor of The Nation:

Sir: Permit me to join in the agitation which I trust will lead to the abolishment of the postal note as at present constituted. In the routine of my office work I receive daily a considerable number of these notes, the periodical assorting and collating of which, for the purpose of presenting them for payment, is a task alike trying to one's eyes and patience. Either by governmental prescription or else by a remarkable coincidence, the ink used by most country postmasters is of a very pale and uncertain color—

just the shade which assimilates itself most readily with the dark yellow ground of the note; and as the calligraphy is sometimes as doubtful as the ink, it becomes necessary to resort to the punched table on the margin in order to ascertain the amount. The notes lapsing after three months from the last day of the month of issue, a reference to the punched table on the other margin is necessary in the very numerous cases where the stamped date is illegible. I have at this moment several notes before me which, in this regard, would defy the skill of the most accomplished expert. Lastly, the Government requires the signature of the recipient—an utterly meaningless procedure at best (considering that the notes are payable to *bearer*), but a very vexatious one in the case of the officer of a corporation who must (or ought to) affix his name to that of the firm in the infinitesimal space provided therefor. Y.

BISHOP WARREN'S PRAYER-GAUGE.

To the Editor of The Nation:

Sir: Bishop Warren, of the Methodist Episcopal Church, is sojourning in Texas, and, being newly married, may be considered as enjoying his honeymoon. Writing to the *Christian Advocate* of New York, he mentions a brother-clergyman of the church South, only thirty days married, who died of smallpox, and very piously winds up by referring to the widow of the same gentleman, "very sick" (presumably with the like disease), in the following terms: "We cannot understand God's plans enough to know whether or not to pray for her recovery."

Now, a novel idea is presented here for Christians to consider. If our ignorance of God's plans is to give the negative to our supplications of the divine power, will the good Bishop please define the field in which endeavor of this kind is legitimate, seeing that our poor human faculty is so incapable of comprehending the purposes of the Deity in general? Prayer for the sick has generally been regarded as within the proper scope of entreaty to the Almighty, whatever the circumstances, and they seem to have been especially distressing in the case cited by the Bishop; but if there be any limitation of the privilege, it would seem to be incumbent on those who are versed in matters of the kind, as the Bishop himself must be, to lay down some rules by which plain Christians may be guided.

J. H. M.

Scottsburgh, N. Y., March 8, 1884.

Notes.

D. Appleton & Co. announce for speedy publication 'The Relation of Animal Diseases to the Public Health,' by Frank S. Billings, V. S., of Boston, in which the trichiniasis question is fully discussed.

Houghton, Mifflin & Co have in press 'Studies in History'—events and personages—by Henry Cabot Lodge; 'Memories of Rufus Choate,' by Judge Neilson, of Brooklyn; 'John Adams,' in the "American Statesmen" series, by John T. Morse, jr.; the 'Lives of James and Lucretia Mott,' by Mrs. Anna D. Hallowell; a study of Balzac, by Edgar E. Saltus; an edition in one volume of the Poetical Works of Edmund C. Stedman; a 'Handbook of American Authors,' by Oscar Fay Adams; and a translation, with additions and an index, of Ploetz's 'Epitome of Ancient, Mediæval, and Modern History,' by Wm. H. Tillinghast, of Harvard University.

L. R. Hammersly & Co., Philadelphia, will publish next month 'The Church Cyclopædia: a Dictionary of Church Doctrine, History, Organization, and Ritual,' edited by the Rev. Prof. A. A. Benton, of Delaware College. Diocesan histories will form an important feature of the work, which will fill 800 pages, imperial 8vo, and be sold only by subscription.

'A Manual of Biographical Literature,' compiled by Mr. W. M. Griswold, and designed as a supplement to Oettinger's 'Bibliographie Biographique' (which ends with the year 1854), is ready to be printed if a sufficient number of subscriptions, at $2.00 a copy, is forthcoming. "Sufficient," as we are accustomed to understand in Mr. Griswold's happy theory of work, means not what will bring a profit, but will pay expenses. His address is "Q P. Index," Bangor, Me.

The Rev. Lawrence H. Mills, an American Orientalist, now residing in Hanover, Germany, is under contract with the Delegates of the Clarendon Press, Oxford, to furnish the third volume of the translations of the Zend-Avesta, in the series of "Sacred Books of the East," edited by Professor Max Müller. In so doing he takes the place of the well-known French scholar, Professor James Darmesteter, whose engagements are such as to preclude his undertaking the task. The volume in question will contain the Yasna, Visparad, Âfrîgân, and Gâhs. Mr. Mills has qualified himself for this work by his labors, only partly made public as yet, but very favorably received by competent critics, on the Zoroastrian Gâthâs.

The Coburn & Newman Publishing Company, of Chicago, have in press 'The Life and Letters of John Brown,' a large volume which will be sold by subscription. The editor, Will M. Clemens, of Cleveland, Ohio, is said to have incorporated in the work many new and heretofore unpublished facts relative to his subject.

Lee & Shepard, Boston, have reprinted from the *Nation* of February 7 the obituary notice of the late Wendell Phillips from the pen of Mr. T. W. Higginson. We have every reason to believe that in this pamphlet form it will meet the desire of a large number to preserve it by itself.

The distinguishing feature of Miss Yonge's 'Stories of American History' (Appletons) is their wide range. The whole of American history, geographically as well as chronologically, is brought here within a small compass, so that Canada and the South American States receive their share of attention, with such valuable collateral matter, *e. g.*, illustrating the slavery controversy, as "the emancipation of negroes in the English Isles" (chap. xl.). The book is written in a fair and liberal spirit, and is accurate so far as we have examined, but the style is cumbered with hard words, and therefore not adapted to young children.

Mr. Howells's amusing little farce, "The Register," which was first printed in *Harper's Magazine*, has been published as a pretty pocket volume by J. R. Osgood & Co. The theme, the situation, and the characters are, and may be commended to foreigners as, quite American.

Much gilt upon the leaves and binding hardly serves to make a handsome book of the fresh impression from the plates of 'Hans Breitmann's Ballads' (Philadelphia: Peterson). The typography needs to be thoroughly renovated before there can be an improved edition.

Häusser's 'Period of the Reformation (1517-1648),' which has been out of print for two or three years, except in a rather costly English edition, has again been put on the market, at the old price, by Robert Carter & Bros.

The February number of the *Library Journal* contains an abstract of two thoughtful addresses recently made in Pittsfield, Mass., by Mr. James M. Hubbard, in connection with his rearrangement and supervision of the Berkshire Athenæum in that town. Their subject was, "How to Use a Public Library," with special reference to the guidance of the young.

Jackson's Administration and Mexico are the topics of Mr. Foster's *Monthly Reference Lists* for February.

The last *Bulletin*, No. 67, of the Boston Public Library, has a bibliographical chapter on our departing guest, Mr. Matthew Arnold, showing the list of his writings, his editings and prefacings, and of the general criticisms upon these. The valuable index to American Local History is continued nearly or perhaps quite to the letter D, and Mr. Thorvald Solberg contributes a list of the text-editions and translations of the Eddas.

The latest of the Bureau of Education's Circulars of Information (No. 4, 1883) consists of Recent School-Law Decisions, compiled by Mr. Lyndon A. Smith. We find, by the way, in the last report of the librarian of the American Antiquarian Society at Worcester, Mass., a suggestion which ought to be fruitful. Referring to the list of its American newspaper collections which that Society furnished for the late census, Mr. Barton inquires: "If such work can be undertaken decennially by the Census Bureau, why should not the 'Circulars of Information,' frequently issued by the Bureau of Education, contain lists of and even indexes to special subjects, if not to literature in general?" To give precision to this request, we will indicate two valuable services which the Bureau can easily render. (1) Let it procure from the foremost libraries in the country a statement of the departments in which they are strong, and then classify these departments with appropriate references. The utility of this for special students is patent. (2) Let it in the same way obtain lists of the newspaper files in each library, with such particularity as to dates and volumes as may be practicable, and then arrange these geographically and alphabetically.

A course of lectures on Archæology will be delivered at the Johns Hopkins University during this season, the first, by Dr. Waldstein, having already been read before his departure for England. Mr. J. T. Clarke, lately director of the work at Assos, will give four—"A Plea for Practical Archæology," "Work at Assos," and "Projects for Cyrene," being the subjects. Mr. W. J. Stillman will give three, on "Prehistoric Research in the Classical Field," "Research in Greece," and "Archæology and Art." Six will be given by Dr. A. Emerson, Fellow in Greek, on Olympia and the results of the late excavations there; and the concluding lecture, by Prof. Gildersleeve, will treat of literary and plastic art.

President White's annual report on the condition of Cornell University is at all points a cheering document. The future of the library, with its magnificent endowment, is something to dream about. We have been interested in what the report says of the increasing usefulness of the university press, a most natural adjunct of our highest institutions of learning. Endowment will probably reach this, however, last of all the departments, for a passion for the art of Gutenberg seldom overtakes the wealthy.

The tenth annual report of the President of the Boston University—which, like Cornell, practises co-education of the sexes—refers to "a most successful reproduction of the 'Electra' of Sophocles in the original Greek," with appropriate accessories, as "the first instance in history in which an ancient Greek play has been reproduced at the suggestion and with the participation of women."

Cornell, since the completion of its new gymnasium, intends following Harvard's example in employing a medical director who shall at the same time be a member of the Faculty. The

same course will be adopted by the Johns Hopkins University, as we learn from President Gilman's eighth annual report.

Prosperity is the keynote of President Walker's annual report to the Corporation of the Massachusetts Institute of Technology. In this interesting document we note the improvements in the accommodations for women, whose number among the students continues small, but whose place is assured in one department at least, that of chemistry. Most of the eleven are pursuing this subject or biology. The French and German languages are both required and elective studies—the former being necessary for admission. The number of students in French is 145; in German, 167; in Italian—a pure elective —2.

Among the latest ventures in German periodical literature is the *Vierteljahrsschrift für Cultur und Litteratur der Renaissance*, under the editorial direction of Ludwig Geiger, whose qualifications for treating of the Renaissance are abundantly shown in his 'Renaissance und Humanismus,' a work upon Petrarch, and in the life of Reuchlin, the German Humanist. The great intellectual movement which held sway in Europe from the fourteenth to the sixteenth centuries, preëminently among the Latin races, will be the special field of the new enterprise. While the literature of the period will have the chief consideration, the great achievements in art will receive considerable attention.

The literature of Renaissance history, by the way, has just been enriched by the addition of a third volume to Prof. Gustav Koerting's 'Geschichte der Litteratur Italiens im Zeitalter der Renaissance,' treating of the beginnings of the literary movement. The life and works of Petrarch and Boccaccio, it will be remembered, are the subjects of the first two volumes. Dr. Koerting is professor of Romanic and English Philology at the Royal Academy at Münster, in Westphalia.

A brochure by Prof. Villari—a reprint from the *Nuova Antologia*—renders due homage to the late Francisco de Sanctis as the father of sound criticism in Italy. This study of De Sanctis's character, career, works, and influence on Italian literature by a man who is unquestionably in the front rank of Italian writers, whether as regards his ability, his balanced judgment, or his sterling literary honesty, is certainly a "monument more lasting than brass."

The origin of the municipal institutions of the middle ages has been studied chiefly in relation to England, France, and Germany, each of which countries affords distinct and interesting phases of their development. Students of the subject will be glad to examine the analogies afforded by Italy, in a monograph by Dr. Max Handloike, entitled 'Die lombardischen Städte unter der Herrschaft der Bischöfe, und die Entstehung der Communen.' It consists of three chapters: the first treating of Immunities, the institution out of which the municipal institutions grew here as well as in Germany; the second, of the officers of the Bishops; the third of the communes. It would appear that, while the earlier development was essentially identical in Germany and in Italy—both countries coming alike under the authority of the Emperor —the final form taken by the municipalities of Lombardy, at a time when the Emperor's authority in Italy had been weakened, was the same as in France, the commune. The commune, it is well known, was strictly prohibited in Germany, and never obtained a permanent foothold in England. The author takes positive ground against the view of Savigny that the municipal organization of the later Empire continued without essential interruption down into the middle ages. He shows, nevertheless, that the inhabitants of the towns continued to hold certain property in common—meadow, forest, etc.—and that this common property was the starting point in the new municipal life of the eleventh century. But this was a wholly new development, and the newly-created office, that of *consuls*, for the management of the common property, had no organic connection, like the *échevins* of France and the *Schöffen* of Germany, with the old board of *scabini*. Once established, they drew to themselves the jurisdictional and other administrative powers, and became the characteristic and distinctive feature of the Lombard communes.

A valuable fragment of a middle-high-German manuscript, written towards the end of the thirteenth century, has lately been discovered. The fortunate discoverer, Dr. Milchsack, of Wolfenbüttel, Brunswick, who found the four parchment leaves used as the binding of an old print ('Sermones dormi secure,' 1500), recognized at once that they contained poems by Walther von der Vogelweide. The fragment has now been edited by Professor Zarncke in the *Berichte* of the Royal Saxon Academy of Sciences, and German scholars will be pleased to see that the genuine stanzas (about twenty-two in all) offer a number of new and important various readings. This manuscript of Walther's poetry shows great independence, and the remainder of it would doubtless be exceedingly valuable if we could find it; but this we can hardly expect.

F. W. Christern has received the latest catalogue of portraits representing the stock of the famous Amsterdam house of Frederik Muller & Co. Collectors will find it worth their attention on many accounts, but especially for a remarkable collection of Franklin and Washington portraits (73 of the former and 19 of the latter).

White, Stokes & Allen send us a tasteful and elaborate Easter "card," if that term can be applied to what is in reality a small folio of flowers and poetry, with illustrations of Easter lilies, violets, trailing arbutus and azaleas fairly well chromolithographed.

—The Amsterdam weekly *Portefeuille* publishes, in its issue of February 16, a (German) rejoinder of the "Association for Promoting the Interests of the Book Trade in the Netherlands" to an attack on Dutch publishers made by Professor Ebers in the *Magazin für die Litteratur des In- und Auslandes*. Professor Ebers had spoken of the "piracy" practised by them on German authors, charging more especially the publishing house of Scrinerius in Utrecht with reprinting four of his novels; and the *Börsenblatt für den deutschen Buchhandel* had repeated and emphasized Professor Ebers's charges. Now, the principal members of the above mentioned association show in their reply how grossly both Professor Ebers and the *Börsenblatt* exaggerated their grievances against Dutch publishers, inasmuch as all the German works reprinted in Holland since 1860 have consisted, besides several editions of Heine, of four volumes of poetry, by Geibel, Freiligrath, and Hamerling. Without sanctioning unauthorized republications of any kind, the committee very properly reprove Professor Ebers and the *Börsenblatt* for their hasty generalizations, reminding the latter of its own declaration in 1874, that "in Holland the reprinting of German works is of very rare occurrence. In any case, we can for the present do without a copyright treaty with Holland." Since that time only one German book, Hamerling's, has been reprinted in Holland. In justice to Professer Ebers we must add that he had already, in *De Portefeuille* of February 2, retracted his accusations—based on erroneous information—against Dutch publishers in general, and modified his charges against the firm of Scrinerius in particular. The latter had merely sold (not republished) the American pirated reprint of his novels.

—Considering that the 'Contes' of Saint-Lambert are found appended to the numerous editions of his poem "Les Saisons," first published at Amsterdam and Paris in 1769, it at first sight seems strange to find them in Paul Lacroix's collection of "Chefs-d'œuvre Inconnus." The editor explains that "unknown" in this case really means forgotten; for although these tales in the past have not lacked readers, yet, owing in a measure perhaps to the silence or unfriendly criticism of the author's contemporaries, they have been suffered to pass out of recollection. The encyclopædists, among whom were some of Saint-Lambert's intimates, were inclined to look with disfavor upon his efforts at fiction—a feeling which, in Diderot's case at least, Lacroix thinks owing to fear of rivalry. Voltaire's treatment of the stories is so much the more marked by his laudation of "Les Saisons," which he compared to the Georgics of Virgil. The coldness of the philosophers was compensated by the warmth of the reception accorded the stories in the salons. The tales here reprinted are "L'Abenaki," "Sara Th——," and "Zméo." Lacroix looks upon the last as the possible inspirer of Victor Hugo's "Bug-Jargal," but this seems to us fanciful. For some reason Saint-Lambert did not think any of these tales worthy admittance among his 'Œuvres Philosophiques' (Paris, 1801), where is found the "Deux Amis, Conte Iroquois," which is an expansion or development of the idea of "L'Abenaki." It may not be amiss to note here that MM. Lucien Perey and Gaston Maugras, who have so delightfully edited the letters and documents relating to Mme. d'Épinay, have in hand a work upon the *rapports* between Mme. d'Houdetot and Saint Lambert, also to be constructed from medited documents. Another interesting contribution to the literary and social history of the facile eighteenth century, we are, according to late announcement, to look for from M. Scherer, who is preparing an exhaustive study of Grimm's literary correspondence.

—Very convenient, among recent German text-books of zoölogy, is Von Mojsisovics's little hand-book of classification ('Systematische Uebersicht des Thierreiches') It gives a systematic view of the classification of the animal kingdom about as fully as this topic would be treated in a year's course of lectures, and is intended to save the time of teacher and class in dictating and copying definitions. The classification is by no means antiquated, Haeckel being followed for the Cœlenterata, with which the sponges are united. Von Ihering's classification of the mollusks is given, though not as the principal one. A singular anomaly is the separation of Bryozoa and Brachiopoda, though somewhat doubtfully, as distinct "types." The same position is assigned to the Tunicata, which are, of course, placed in immediate relation to the vertebrates. The definitions are clear and concise, and the book can be used to advantage by teachers whose course of zoölogy involves the giving of definitions. The same praise may be given to the third edition of Leunis's 'Synopsis' ('Synopsis der drei Naturreiche'), of which the first volume, containing the vertebrates and mollusks, has appeared. Its illustrations and descriptions are its strong points, the classification not being in all respects up to date. The illustrations are particularly good, many of them being modified from those in Brehm's 'Thierleben.' A feature worthy of general imitation is the giving of the etymology of all scientific names. The 'Comparative Zoölogy' ('Vergleichende Zoölogie') of

Dr. Leonhardt, although the work of a teacher rather than of a zoölogist, is decidedly above the level of school text-books. It offers, especially under the invertebrates, a great deal of condensed information in a very accessible form. The plates in many places betray unfamiliarity with the objects themselves, but a working teacher will get many useful hints from the book, which is itself the outcome of teaching.

—Of a different and much higher character than the preceding works is Wiedersheim's 'Anatomy of the Vertebrates' ('Lehrbuch der vergleichenden Anatomie der Wirbelthiere'). It belongs to that very small class of text books of which Balfour's, Gegenbaur's, and Claus's manuals stand as types. Clear in style, vigorous in its grasp of the subject, and penetrated by the spirit of modern zoölogy, it is a work from which the student derives inspiration as well as knowledge. The subject is treated by systems of organs, not according to the classification. Each system is first described in general; then follows a more detailed account of the structure in each class of the vertebrates, and this is succeeded in all the more important and complicated systems by a summary of the facts. The development of the organs is kept constantly in view, and is everywhere made the basis of the description. The illustrations are numerous, new, well engraved, and, in the section on circulation, colored. The book closes with a selection from the literature, arranged by topics, and covering over fifty pages. This 'Lehrbuch' fills a gap in zoölogical literature which has long waited to be closed. Huxley's manual, with which the English student would compare the book, is much less full; still more meagre in comparison is Gegenbaur. A more elaborate criticism would show some inequalities in execution, mainly in proportion, and perhaps a very few over-confident expressions of opinion; but there are few text-books indeed which so decisively mark their authors as at once scientists and teachers.

—The late Dr. Henry Dunbar was born to an hereditary, passionate, unreasoning love of Greek, and worked at Greek with the "dour" persistency of a Scotchman. The accomplished Professor of Greek in the University of Aberdeen saved him from the prodigious mistake of preparing an Homeric grammar, which, with his range of vision, would have been a monumental blunder, and suggested to him instead the harmless task of getting up a concordance to the 'Odyssey,' which was published by the Clarendon Press in 1880. It was evidently a work of immense labor; and, at the close of his modest preface, he enlists our sympathies by stating that "writing sixty-two thousand four hundred lines of closely-written Greek MS. had somewhat weakened and impaired his eyesight." The usual compliments were paid to the work, and the diligent compiler was rewarded, if we remember aright, by a Civil List pension. It is sad to think that the book is entirely inadequate for any but the merest literary purposes. Ink must be mixed with brains. Cruden's Concordance to the Bible has been superseded, and Dunbar's Concordance to the 'Odyssey' is, after all, only a makeshift. Even the important particles, even the prepositions, are not included, and old Seber is as indispensable to the investigator as ever. The same thing is to be said of the Concordance to Aristophanes, just issued by the Clarendon Press, which published the other concordance—both sumptuously, as a matter of course. The author "did not live to see the fruit of his labors." With him died an indefatigable man, much to be admired for his untiring industry. But as his former concordance did not make Seber useless, so this concordance does not enable us to dispense with the most brainless index ever made—the index of Caravella. In Caravella's book, not only are the words registered simply according to the external form—that is true of Seber—but separate categories are made for the same forms, the same words with varying accents: so many μέν's with acute, so many μὲν's with grave accent. And though Dunbar does not go quite so far, he records in separate lists words that have received an additional accent from enclisis. Still, this might be forgiven. It is a sin in the direction of over-fulness. But Caravella is reasonably complete in his vocabulary. Dunbar is not: so he gives two lines to ἵνα—one for the form ἵν', another for the form ἵνα, each followed by κ. τ. λ.; to ὡς he gives one line, with κ. τ. λ. again. How could any one gather anything as to the use of ἵνα and ὡς final from such a list? For purposes of research, then, the value of the concordance has been reduced by the plan of the compiler—if it may be called a plan—to a minimum; and the Clarendon Press ought at least to have supplemented the work by an index to the missing articles. In a non-technical journal like the *Nation*, it is not necessary to go into the detail of mistakes some of which do little credit to the proof-reader.

—The thirty-eighth annual report of the Director of the Astronomical Observatory of Harvard College, presented to the Visiting Committee in December last, and laid before the Board of Overseers on the 9th of January, falls short in no respect of the standard set by the character of the work done at that establishment during the last five years. The subscription of five thousand dollars annually for the term of five years, which was secured in 1878, has now expired, and, to replace it, an attempt has been made to raise by subscription the sum of one hundred thousand dollars as a permanent fund. Up to the present time about fifty thousand dollars has been promised for this purpose, which will be sufficient to prevent the sudden restriction of scientific operations, otherwise inevitable on the expiration of the subscription of 1878. Professor Pickering's interest in the satellites of Jupiter—a new method of observing the eclipses of which he devised in 1878—has led him to experiment on the occultations and transits of these bodies also. Employing the double-image micrometer at every approach of a satellite to or recession from the disc of the planet, he has derived results which appear to indicate that valuable observations may be made on these frequently-recurring phenomena, heretofore regarded with very little favor by astronomers. After a year's interruption, the fundamental observations with the meridian circle were resumed early in 1883, and the instrument was kept in active service during the remainder of the year. A series of observations was undertaken for determining the longitude of the McGill College Observatory at Montreal, and extended through the month of June. The reduction of the older series of observations with the meridian circle is now completed, and the copy prepared for printing, two volumes being ready for publication.

—The meridian photometer, which bears the same relation to photometry that a transit circle does to measurements of position, must now be regarded as having fairly established its position as a permanent instrument of the Observatory. After a thorough trial it has shown itself capable, in the hands of Professor Pickering and his assistants, of determining absolute stellar magnitudes with great accuracy. As it can determine the brightness of any star of the ninth magnitude or brighter, its field of work is, for the present, indefinitely great. The most important investigation in progress has been the revision of the *Durchmusterung* magnitudes, the results of the estimates of brightness made at thirteen observatories and extending over a period of ten or fifteen years being thus brought together and reduced to a single system. Some miscellaneous observations have also been taken, of which those of Neptune on eleven nights give its light as 7.71. The study of the variable stars is made an important part of the work of the Observatory, and is conducted by Mr. Chandler. The aid of amateurs and others in the observation of stars known or suspected to be variable has been found to yield valuable results. In an investigation in astronomical photography, undertaken with the assistance of Mr. W. H. Pickering, of the Massachusetts Institute of Technology, it is sought to determine the light and color of the brighter stars, and to construct a photographic map of the whole heavens. The system of announcing astronomical discoveries has received an important extension during the year, an association of more than fifty European observatories having been formed, for the purpose of expediting these announcements. The Observatory of Harvard College is now the central bureau for telegraphic announcements in America, this function having been transferred to it by the Smithsonian Institution, which had for many years performed a like service.

—Liszt's "Faust" Symphony was the principal number played on Saturday at the fifth concert of the Symphony Society. It was interpreted with the rare intelligence which always marks Dr. Damrosch's reading of Liszt, and the orchestra has never since its reorganization played so well as on this occasion. It now only needs some improvement in the wood wind to be a really good orchestra. Liszt's symphony has not been heard here for five or six years, but the warm applause it received on Saturday gave reason to believe that it will not again be allowed to rest for so long a time. Like all great art-works which deal with the grand, passionate, sublime, and not the beautiful alone, it is apt to "disagree" at first hearing; but repetition leads to ever-increasing interest which is apt to culminate in enthusiasm. Even as absolute music there is much that is admirable in "Faust." But it is only when the poetic intentions of the composer are understood and followed that we are enabled to appreciate all its beauty. The "symphony" is really a symphonic poem in three parts, for the treatment of the material is based on the principles of leading motives which constantly recur and connect the different movements into an organic whole. The first movement symbolizes Faust's alternating pessimistic musings and longing for the joys of life. The second is an exquisite delineation of Margaret's characteristics, in which we even hear such details as "He loves me, he loves me not." The third is devoted to Mephistopheles, and unites the motives of the previous parts in a caricatured form. At the close a tenor solo and chorus are introduced, as in Beethoven's Ninth Symphony. The "Faust" Symphony is dedicated to Berlioz, and there is evidence of that master's influence in the orchestration and in certain unisono phrases. "Rheingold" and "Walküre" are also curiously suggested in a few places. But the symphony as a whole is Liszt's own creation, the most remarkable thing in which is the appropriateness of the leading motives, and the ever-increasing interest which their recurrence inspires in the hearer. As in the symphonic poems, the Hungarian element reveals itself in the abrupt rhythmic changes and peculiar accentuations. The "Faust" Symphony was preceded by the "Freischütz" over-

ture, which was played with great spirit, yet with an occasional want of distinctness in the middle parts; and by two selections from Berlioz's "Childhood of Christ," a serenade for two flutes and harp, and "The Repose of the Holy Family," with tenor solo. Neither of these selections contains a germ of a new musical idea, and the first especially is of wearisome, because artificial, simplicity.

LAND AND ITS RENT.

Land and Its Rent. By Francis A. Walker, Ph.D., LL.D. Boston: Little, Brown & Co. 1883. Pp. 220.

Social Problems. By Henry George, author of 'Progress and Poverty.' Chicago and New York: Belford, Clarke & Co. 1883.

PROFESSOR WALKER'S volume deals mainly with the economic blunders of Carey, Bastiat, and Henry George in the matter of rent. The errors of Carey and Bastiat were identical—so much so, indeed, that, after the latter's death, the friends of the former sought to fasten a charge of plagiarism upon the author of the 'Harmonies Économiques.' A lively controversy resulted, which has left only this impression among economists: that it is contrary to all that we know of Bastiat to suppose that he wittingly appropriated another man's ideas without giving him due credit; but that if he appropriated Carey's ideas of rent he took something of no value, and that, therefore, an indictment would not lie.

Mr. Carey's idea was, briefly, that there is no such thing as rent in the Ricardian sense—*i. e.*, no surplus value in the soil and its products over and above the labor and the interest on capital employed in its cultivation. "There is not," he says, "throughout the United States, a county, township, town, or city that would sell for cost, or one whose rents are equal to the interest upon labor and capital expended." And again: "If we show that the land heretofore appropriated is not only not worth as much labor as it has cost to *produce* it in its present condition [meaning, of course, to *bring it into* its present condition], but that it could not be reproduced by the labor that its present value would purchase, it will be obvious to the reader that its whole value is due to that which has been applied to its improvement." "If we show," says Mr. Carey—but that is what he never did nor could show, and what nobody can show. However great a sum (if it could be computed in dollars and cents) may have been expended in bringing Lancaster County, Pa., for instance, to its present state of productiveness, it is to be borne in mind that the laborers in each generation have got their living from it; and who shall estimate the value of this as an offset to the expenditure? It is obviously impossible to reason in this way, because there are no data or fixed starting-points. On the other hand, Mr. Carey's postulate implies that the settlement of the American Continent has been a losing operation, and that the further we push the area of cultivation westward the more money we shall lose. There were 6,000,000 acres of public land taken up in Dakota last year. The net losses, according to Mr. Carey, begin when improvement begins, and they increase from year to year. Fencing, draining, house building, railroad building, every expenditure which man makes within the limits of Dakota, or in endeavors to reach Dakota, must be counted as elements of the cost of the land. At the end of any given number of years it will be found that Dakota has cost more than it has come to. Therefore the emigrants to Dakota are under a delusion just as the earlier emigrants to Illinois and Minnesota were. They have all been losing money. Yet, somehow, wealth has marvellously increased.

Professor Walker demolishes the Carey heresy satisfactorily, and then takes up the opposing and equally unfounded assumption of Henry George, that the rent of land is gradually swallowing up all the wealth of the world, and is the cause of all the poverty and misery in it. The careful reader of Mr. George's 'Progress and Poverty' will observe that that loose writer takes pains to overthrow the Malthusian law of population before setting up his own doctrine that rent is the cause of poverty. Malthus looks for the cause of poverty in the well-ascertained fact that if a given quantity of corn exactly suffices for a family of six persons, there will be suffering if the family grows to seven without any increase in the quantity of corn. Then, looking on the one hand at the roundness of the earth and the limitations of agriculture, and on the other at the powers of increase inherent in the human race, he reasons that the former is a fixed and unyielding quantity—somewhat elastic, but nevertheless finite—while the latter is unlimited as a power, and is limited in fact only by the pressure of population upon the means of subsistence. Mr. Malthus observed a tendency of population to increase faster than the means of subsistence could be provided, and he ascribed to this tendency a large part of the sum total of human misery, for the reason that the arrival of the seventh member reduces the whole family to a less quantity of corn than was found to be needed for the comfort of six—provided, of course, that no greater quantity of corn is to be had.

Mr. George not only assails the doctrine of Malthus with the usual arguments and the usual objurgations, implying that it is a reproach to the goodness of God, but he makes the entirely novel and original assertion that "the limit to the population of the globe is only the limit of space." That he means standing-room when he uses the word space is shown by the context, as well as by the whole drift of his argument. Notwithstanding the assumed completeness of his refutation of Malthus, Mr. George is apparently not satisfied with it, for he undertakes to show that his own theory is true regardless of Malthus. Pains and time taken to uphold Malthus against George are therefore, as Professor Walker points out, wasted. Let us pass the sponge at once over all that part of his book, and come to the point. "Irrespective of the increase of population," he says, "the effect of improvemen s in production and exchange is to increase rent." This is the reason why Progress and Poverty go together. It is not because population increases and presses upon the means of subsistence, but because the land-owners swallow up all the surplus wealth which new discoveries and inventions yield to mankind. In another place Mr. George states his proposition thus: "Land, being held as private property, would produce in a stationary population all the effects attributed by the Malthusian doctrine to pressure of population." How is this proved? In this wise:

"The amount of wealth produced is nowhere commensurate with the desire for wealth; and desire mounts with every additional opportunity for its gratification. This being the case, the effect of labor-saving improvements will be to increase the production of wealth. Now, for the production of wealth two things are required: labor and land. *Therefore*, the effect of labor-saving improvements will be to extend the demand for land, and, wherever the limit of the quality of land in use is reached, to bring into cultivation lands of less natural productiveness, or to extend cultivation on the same lands to a point of lower natural productiveness. And thus while the primary effect of labor-saving improvements is to increase the power of labor, the secondary effect is to extend cultivation, and, where this lowers the margin of cultivation, to increase rent. . . . It is important that this be fully understood, for it shows that effects attributed by current theories to increase of population are really due to progress of invention, and explains the otherwise perplexing fact that labor-saving machinery everywhere fails to benefit laborers."

It might be inferred that one remedy for poverty would be the stoppage of invention and the destruction of all labor-saving machinery, such as looms, spindles, sewing machines, railways, steamships, etc. Population might increase tenfold without harm if we could only desist from the use of machinery, which, through its occult power of raising rent, grinds the laborer ever lower in the dust. The difficulty in applying this remedy would be to know where to stop, since everything superior to one's finger nails is the result of invention.

Professor Walker points out the absolute *non sequitur* of Mr. George's "therefore," and then shows that inventions and labor-saving machinery, so far from increasing the demand for land (population remaining stationary), really increase the demand for labor—that is, cause wages to rise and rent either to fall or to remain stationary. An employer of labor, however rich, cannot eat more than a given quantity of food per day; but an invention which dispenses with four out of five of the hands formerly required in the making of coarse cotton cloth enables the employer and the employees to make finer articles out of the same raw material, cotton. No more cotton is required in the making of a square yard of lace than in making a square yard of bagging—perhaps not so much; no more land is required for the one purpose than for the other; but much more labor is required. Therefore Mr. George's argument—and this is the real pivot and keystone of his 'Progress and Poverty'—is absolutely false.

Indeed, there is a shorter way of proving its falsity than that followed by Professor Walker, for in a stationary population there can be no increase of demand for land without an increase of the human appetite. Mr. George's proposition could not be true unless the capacity of the human stomach were enlarged or were susceptible of enlargement in proportion to the increase of wealth. This, we know, is not the fact. The rich man may have a greater variety of food than the poor man, it may be more nicely cooked, and more tastefully served, but the absolute quantity consumed by each cannot be greatly different, or if there be any difference it is in favor of the poor man, whose appetite is always good, while the rich man's is often feeble and precarious. Therefore it cannot be true that in a stationary population there is any tendency whatever to an increase of the rental value of land, whether new inventions and improvements and labor-saving machines are brought into use or not.

Mr. Frederic Harrison, a radical of the radicals, has reviewed Mr. George's work lately. He recommends those who find fault with his teachings to address themselves to the causes of the poverty against which Mr. George so vehemently protests. As for Mr. George's arguments, he (Mr. Harrison) has carefully examined all that he has written on the subject of wages, interest, population, commercial crises, and rent, and he finds no truth in it that can be called new or original, while the reasoning, as a whole, is untenable and misleading. In his volume of 'Social Problems' Mr. George has anticipated Mr. Harrison's judgment by subordinating argument to wailing and scolding. There is much abuse of the rich, and much compassion for the poor, with now and then a threat against the former, flanked by an admonition to the latter. The rich are enjoying what does not belong to

them; they ought to divide, and they may be compelled to do so, but then they are not to blame, and a division of property would leave things where they were before, because new inequalities would immediately spring up. The trouble is all in the private ownership of land. Tax all land up to its rental value, and poverty will speedily disappear from the earth. This is 'Progress and Poverty' over again, with less argument and more passion, less political economy and more tirade and bombast. We do not underestimate the evils which Mr. George depicts, but his remedy for them is as worthless and futile as it would be atrocious if it could be carried into execution. The only country where the system of state ownership and its correlative (taxation of rental value) exists on an extensive scale is India. Mr. George has been at much pains to explain why poverty exists on such a deplorable scale in the only country where society is ruled by his beneficent system. Caste, oppression, injustice, superstition, foreign domination, war, and other calamities are cited to explain how the system fails to work. But these are the things which the system ought to eradicate and do away with. Perhaps the real reason is that the land tax is not high enough to take the whole rental value, but, by leaving a modicum of unearned wealth in the hands of the tenant, vitiates the principle and renders the experiment nugatory.

Turning over the pages of 'Social Problems,' it is found that Mr. George gets wilder as he goes on. In his chapter on "Human Garbage," he shows how much worse the American landlord system is, or soon will be, than the Irish landlord system, so that really the Irish peasantry who are "dumped," as he puts it, on our shores, are virtually leaping from the frying pan into the fire. Moreover, they are falling into the toils of the same taskmasters whom they left at home, for the soil of this country is passing so rapidly into the hands of the British aristocracy that the latter will within a few years "virtually own more Americans than they now own Irishmen." In his chapter on "Slavery" he shows how this will come about, or rather how land slavery—the destined portion of the country which boasts a Declaration of Independence, a Constitution, and a Fifteenth Amendment—is really worse than chattel slavery, because under the chattel system the slave-owner is bound to feed and shelter his victims in old age, while under the land system he can turn them out on the roadside to starve. In the chapter on the "American Farmer," where he tells that important member of the community how much happier he would be if the taxes on his land were increased so as to swallow the whole rental value, he says: "It has already become impossible in our older States for a man starting with nothing to become by his labor the owner of a farm." This is a sample statement of fact, thrown in as though it were a matter of common notoriety, which need only be mentioned to be universally recognized. The truth is that the most striking fact connected with agriculture in the older States, of recent years, has been the acquisition of farms in Massachusetts and Connecticut by men starting with nothing—Irishmen mainly, or, as Mr. George, in the abundance of his pity, designates them, "human garbage dumped upon our shores."

THE RIVERSIDE SHAKSPERE.

Mr. William Shakespeare's Comedies, Histories, Tragedies, and Poems. The Text newly edited, with Glossarial, Historical, and Explanatory Notes, by Richard Grant White. 3 vols. Boston: Houghton, Mifflin & Co.

WE have already summarily described this new edition ("the Riverside") of Shakspere as, in many respects, to be welcomed. In the all-important matter of correctness of the text, Mr. White almost uniformly shows admirable care and good judgment. But these qualities are less marked in his comments on his author, and this part of his work is also frequently injured by two grave faults: a lack of that delicacy of appreciation to which the peculiar charm of the best editing is due, and a lack of that liberal scholarship which makes opinion valuable, and which no familiarity with other men's scholarship can take the place of. Even in the few and short notes Mr. White gives to this edition these defects are visible, and the bad taste which is their natural accompaniment.

The weight of some of his statements may, therefore, be questioned, and three notes, at the least, may be controverted from Shakspere's own authority. To the line in "Macbeth," v. 8: 4,

"Of all men else I have avoided thee,"

Mr. White says: "Strange that the absurdity of this line has never been remarked. It rivals Milton's 'the fairest of her daughters Eve.'" It is at least to be said that this line, if pointed out to Shakspere himself, would not apparently have appeared to him "absurd." There are similar constructions, to be found elsewhere in the plays, which indicate that Shakspere sometimes accepted "of" in the sense of "beyond," "more than." One instance is this in the "Two Gentlemen of Verona" (i. 2: 27):

"*Julia.* Why, he, of all the rest, hath never moved me.
Lucetta. Yet he, of all the rest, I think best loves ye."

Another apparent oversight on Mr. White's part occurs where *Romeo* says of the Apothecary that he had noted him "culling of simples." Mr. White hereupon asserts, "a misuse of the word [culling] in the sense of sorting, arranging: to cull is to gather, to pluck." Shakspere never uses it in this latter sense, but always as here—*not* "sorting, arranging," but as to pick out, to select from many. In this same play *Juliet* says to *Lady Capulet* (iv. 3),

"——we have culled such necessaries
As are behoveful for our state to-morrow";

and

"——come knights from east to west
And cull their flower, Ajax shall cope the best"
("Troilus and Cressida," ii. 3: 248);

and

"Call for our chiefest men of discipline,
To cull the plots of best advantages"
("King John," ii.: 40);

and

"And in this covert will we make our stand,
Culling the principal of all the deer"
("King Henry 6th," iii. 1: 3);

and elsewhere. Is this "misuse" of the word? It is true that Shakspere's stamp does not always impress its meaning permanently on the word he utters, as witness our not accepting "modern" with the signification he assigned to it; but in a case like this, what he marks a word as meaning, we may be sure it does mean.

But far more unaccountable than either of these oversights is Mr. White's extraordinary remark on the lines in *Antony's* speech ("Julius Cæsar," iii., 2, 91):

"You all did see that on the Lupercal
I thrice presented him a kingly crown."

The note to this is: "*On the Lupercal*: a mistake. The Lupercal was not a street, or a bridge, or the like, but a grotto"!! Has Mr. White never read the line in the first scene of the play,

"You know it is *the feast of Lupercal*"?

There is great difficulty in proving any Shakspere criticism to be "a mistake" since it is apt to resolve itself into an incontestable difference of opinion; and the general opinions Mr. White expresses upon the plays cannot, in any case, be fairly called "mistakes," but some of them are certainly open to question. First of all, perhaps, in startlingness, is his opinion, with regard to "Hamlet," that "the period of its action is historically very uncertain, but in Shakspere's imagination it seems to have been somewhere about the tenth century. The duration of the action is as uncertain and indefinite as its period, but into five acts Shakspere seems to have compressed, as his manner was, the incidents of not less than from eight to ten years." This paragraph would appear to many students of the play to be altogether more true if it read thus:

"The period of its action is historically very uncertain, and it is evident that Shakspere's imagination lost sight of historical truth, as his habit was, and pictured the incidents and characters as of his own time. This is proved by the references to the University at Wittenberg, to the sending of young noblemen to Paris, to the children-players; by such pictures as 'Armed at point, exactly cap-à-pie'; and

'——the apparel oft proclaims the man,
And they in France of the best rank and station
Are most select and generous in that';

and the

'Where are my Switzers? Let them guard the door';

and by the *tone* of every scene. The duration of the action is somewhat uncertain, but cannot extend beyond two or three months. This being the case, if we accept the *Grave digger's* statement of *Hamlet's* age, we must admit a certain incongruity in his still wishing to attend the University."

In the introduction to "Henry IV." there is perhaps no underlying mistake, but a confusing inaccuracy of expression, when Mr. White says, speaking of "The Famous Victories of Henry the Fifth," etc. (an earlier play by an unknown author): "In it are found the name and the germ of a character which has added hardly less to Shakspere's fame than those of *Hamlet* and *Iago*—that of *Falstaff*." The fact is, as Mr. White himself immediately states, that "the name," etc., of SIR JOHN OLDCASTLE is in "The Famous Victories," and that Shakspere at first adopted this name for the character which he afterward christened *Falstaff*. But there is not the slightest suggestion of the name of FALSTAFF in "The Famous Victories."

There is similarly a false impression conveyed by carelessness of expression in the note to "Taming of the Shrew," i. 1: 232, by saying "*daughter*, like *laughter* now, was a perfect rhyme to *after*," which certainly suggests the idea that "daughter" was pronounced "dafter." It is only in a later note to "King Lear," i. 4: 300, that Mr. White explains that "caught her," "daughter," "slaughter," "halter," and "after" all rhymed in Shakspere's day; that "after" (and so the others) was pronounced "arter," in "halter" the *l* being probably silent.

A singular note, and we must think it an amusing one, is found in "Lear" (i. 2), in the scene where *Edmund* sings fa, sol, la, mi, while unnoticing his brother's entrance, his last words having been, "O, these eclipses do portend these divisions." Mr. White says, "*Edmund* sings merely to seem at ease, but Shakspere has made him sing quite in keeping with the last part of his speech. His notes (in the natural key) are F, G, A, B—inconsequent, distracting, and implying a discord that demands resolution." It does not take much learning to know that the notes are other than Mr. White makes them, are, in fact, F, G, A, *E* (his series being simply a portion of the diatonic scale), and with regard to the rest of this assertion, one of the most distinguished American composers assures us that to the trained as to the untrained ear there is no such character in this succession of notes as Mr. White attributes to it. Without passing into any discord they might serve for an opening motive to any composition, like the four notes which begin Beethoven's Fifth Symphony. Mr. White's phrase, "in the natural key," is a queer one; and if one talks of *keys*, the notes themselves would perhaps suggest A minor. Of this

passage in the play the great German Shakspere student, Dr. Schmidt, says: "Eine besondere Bedeutung in den gewählten Tönen zu suchen, heisst wol des Guten zu viel thun." It is a wonder that Mr. White does not find meaning in what may be called the song of *Holofernes* ("Love's Labour's Lost," iv. 2). There are not only four but six notes to that—ut, re, sol, la, mi, fa—and very "distractingly" arranged.

From music we will turn to French. Mr. White seems very sure that Shakspere knew but little of the language; but how much does he himself know? To the line

> "Now Esperance! Percy! and set on"
> ("1 Henry IV.," v. 2: 97),

he notes "*Esperance*, a quadrisyllable, pronounced by S. [*sic* throughout], I am afraid, espyransy." There is not the slightest occasion for the fear in this suggestion, as in Shakspere's day, or not long before, all Frenchmen pronounced it as a quadrisyllable.

And the editor seems to stumble in consequence of a pitfall in the text, in the well-known passage in "Henry V.," where the Dauphin is describing his horse, "[qui a]" (as modern editions give it) "les narines de feu." The folio prints it "chez les narines de feu," and Mr. White retains this, giving in a note: "chez les narines de feu=with fire-breathing nostrils." As Mr. White does not hesitate to change "Je intombe" into "Je suis tombé," or "La fin corrone les eumenes" into "La fin couronne les œuvres," or to make other changes elsewhere, his making no change, or suggesting no difficulty here, implies that he supposes "chez les narines" to be as unabsurd as would be "chez les auteurs français." The change to "*aux* narines" would not seem inadmissible.

The note which immediately follows this is also open to criticism. The *Dauphin* calls his horse "le cheval volant, the Pegasus," and just afterward declares, "It is a beast for Perseus." Mr. White explains: "In the literature just preceding S.'s day, his [Perseus's] ship was called his flying horse." Now, it is perfectly clear that Shakspere had no *ship* in his mind, but Pegasus himself, *the* "flying horse"; and if, as is evident, he believed his rider to have been Perseus, it is what his contemporaries also believed, as is proved (among other proofs) by Mr. White's own description (in a note to "Troilus and Cressida," i. 3: 42) of an old print which represents Perseus coming to the rescue of Andromeda, bounding on Pegasus. Compare, also, "Troilus and Cressida," iv. 5: 186.

We alluded just now to the learned German, Dr. Schmidt. It is not to Mr. White's credit that the only time he refers to Schmidt's remarkable and invaluable work, he should speak of it merely as "the so-called Shakspere Lexicon," at the same time characterizing one of its definitions as "the most absurd and inept of all" those suggested. Such treatment of such eminently successful labors as Dr. Schmidt's indicates, at the best, a singular inability to appreciate an admirable combination of accuracy and acuteness.

Mr. White professes to avoid all superfluousness of comment. But the tone of supercilious criticism of his author which prevails throughout finds expression in superfluous judgments. It is every way "ill judged" to say of *Hamlet*: "Shakspere imagined him a weak, imperfect, morbid creature, but a kind-hearted gentleman." And *Othello's* frantic cry of "one entire and perfect chrysolite" would hardly suggest to most editors a dissertation on the valuelessness of this "greenish-yellow stone," and the remark, "Probably Shakspere never saw one, but the word promises largely, and it sounded well in his verse." It is worse than wasting words to speak of *Lady Macbeth's* "society manner," and to describe the feast at the house of Capulet as not "small and early." In a book for more than this year's reading it is undesirable, to say the least, to make an allusion to "the Osric [the Oscar] of our day," or to "the reliable gentleman of our civil war." But if we add that there are some notes not quite quotable, from a stronger taint of the quality exhibited in these chance-chosen instances, we shall have dwelt sufficiently on this point.

We must recur, however, to the superfluousness which lies in the frequent repetition of such criticisms as "mere heedless writing, not the 'grammar' of S.'s time"; "mere reckless indifference, not English then more than now"; "not Elizabethan grammar"; "one of S.'s reckless, but partly unconscious, perversions and inversions for rhythm's sake"; "mere heedlessness"; "mere reckless word-making." These comments are superfluous both for the uninstructed and the instructed reader. The former cares nothing about "Elizabethan grammar"; the latter is likely to have an opinion of his own. And there are passages where it may well be questioned whether this "reckless indifference" is, in truth, "indifference"; as notably in "Antony and Cleopatra," iii. 13: 98:

> "——should I find them
> So saucy with the hand of she here—what's her name,
> Since she was Cleopatra?"

where "she" is almost audibly "*this* she," and where certainly the *hand* of *her here* would have had a strange sound. In the same category of superfluousness may be included Mr. White's constant dwelling on the "Elizabethan grammar" in the use of *it* for *its*—a peculiarity in which he takes what may be called a truly paternal interest. And we must parenthetically observe that the note on the incidents of the death of *Cæsar*, and the number of his wounds, is absolutely unnecessary and irrelevant; yet it is by far the longest of any in the volumes.

The desirable number and length of the notes to such an intentionally "popular" edition of Shakspere, is an open question; and if we have spoken of superfluous notes, we must say, on the other hand, that Mr. White has a very high estimate of the attainments of "the reader of general intelligence" if he honestly believes, as he says, that he has here enabled him to understand "what Shakspere wrote, as nearly as possible in the very way in which he would have understood it . . . if he had lived in London in the reign of James I." And he speaks later of these notes as "explanatory of every obsolete word or phrase, and of every obscure passage." But they are, in fact, inadequate. How many readers of only "general intelligence," without special study, could get at the meaning of such lines as these, which have no notes:

> "if I do prove her haggard" ("Othello," iii. 3: 260),
> "as my farthest band shall pass on thy approof"
> ("Antony," iii. 2: 26),
> "as true as steel, as plantage to the moon"
> ("Troilus," iii. 2: 163),
> "As gentle and as jocund as to jest
> Go I to fight"
> ("Richard II.," i. 3: 95),
> "the presence strewed"
> ("Richard II.," i. 3: 289),
> "the discandying of this pelleted storm"
> ("Antony," iii. 2: 165),
> "this fierce abridgment" ("Cymbeline," v. 5: 382),
> "that nothing-gift of differing multitudes"
> ("Cymbeline," iii. 7: 85),
> "A southwest blow on ye" ("Tempest," i. 2: 323),
> "an eye of green" ("Tempest," ii. 1: 52),
> "I fear you have done yourself some wrong"
> ("Tempest," i. 2: 441),
> "Find written in the margent of his eyes"
> ("Romeo," i. 3: 85),
> "——stand the push
> Of every beardless vain comparative"
> ("1 Henry IV.," iii. 2: 67),
> "now I arise" ("Tempest," i. 2: 169),
> "If not the face of men" ("Julius Cæsar," ii. 1: 114),
> "The question of his death is enroll'd in the Capitol" ("Julius Cæsar," iii. 2: 35),

or many other equally difficult passages. Is Mr. White justified in saying, as he does, "to any reader who does not understand these passages," that the fault is his own?

We have said that Mr. White's editing of the text is always painstaking; but in this edition he has not thought best to give any reasons for the readings he adopts, and this silence makes it impossible to distinguish between purposely chosen words and possible misprints. Notes to indicate intended changes from the usual text would prevent uncertainty in the reader with regard to such passages as,

> "And breath'd such life with kisses in my lips
> That I *receiv'd*, and was an emperor"
> ("Romeo," v. 1: 9),

or even more strangely, in *Melun's* speech ("King John," v. 4: 37), the transposition of a line.

> "Paying the fine of rated treachery
> Even with a treacherous fine of all your lives"—

has a clear meaning, and is the reading of the folio of 1623.

> "Where I may think the remnant of my thoughts
> Even with a treacherous fine of all your lives
> In peace, . . ."

which is Mr. White's reading, has surely no meaning at all. The *certain* misprints are not numerous. Some of them are cases apparently of miswriting—of what Mr. White calls "heterophemy"; as, in the volume of Comedies, p. 711, "the correspondent French title being heedlessly used" should be "*English* title." Histories, p. 145: "Here *Falstaff* . . . says 'say-est' [should be '*speak*'-est] and 'believ-ed.'" We are sorry to touch on Mr. White's French again, but he translates (is it perhaps "heterophemy"?) "il fait fort chaud," by "it's very cold." And he translates "Venetia, Venetia, chi non ti vede non ti pretia," "Venice, Venice, who sees thee not does not *know* thee."

While those persons already familiar with Shakspere may be indebted to Mr. White and his publishers for the use such readers can make of these convenient volumes, it will be seen that the inadequacy and vulgarity of the notes greatly disqualify them in respect to judicious instruction.

RECENT LAW BOOKS.

The Law of Expert and Opinion Evidence Reduced to Rules. With illustrations from adjudged cases. By John D. Lawson. St. Louis: F. H. Thomas & Co. 1883.

The Law of Contracts. By Theophilus Parsons, LL.D. 3 vols. Seventh edition. With additions by William V. Kellen. Boston: Little, Brown & Co. 1883.

Precedents of Equity Pleadings. By Franklin Fiske Heard. Boston: Little, Brown & Co. 1884.

Commentaries on Law, embracing Chapters on the Nature, the Source, and the History of Law; on International Law, Public and Private, and on Constitutional and Statutory Law. By Francis Wharton, LL.D. Philadelphia: Kay & Brother. 1884.

A Treatise on Extraordinary Legal Remedies, embracing Mandamus, Quo Warranto, and Prohibition. By James F. High. Second edition. Chicago: Callaghan & Co. 1884.

The American Decisions. Containing the cases of general value and authority decided in the courts of the several States from the earliest issue of the State Reports to the year 1869. Compiled and annotated by A. C. Freeman. Vols. 44, 45, and 46. San Francisco: A. L. Bancroft & Co.

Index to the American Decisions, and the Editor's notes thereto. With a table of the cases re-reported. Volumes 31 to 45 inclusive, 1837-1846. By A. C. Freeman. San Francisco: A. L. Bancroft & Co.

The Patentability of Inventions. By Henry Childs Merwin. Boston: Little, Brown & Co.

A Treatise on the Law of Pledges. Including collateral securities. By Leonard A. Jones. Boston: Houghton, Mifflin & Co.

A Treatise on the Law of Mortgages of Personal Property. By Leonard A. Jones. Second edition. Revised and enlarged. Boston: Houghton, Mifflin & Co.

A Treatise on Equity Jurisprudence as Administered in the United States of America; adapted for all the States and to the union of legal and equitable remedies under the Reformed Procedure. By John Norton Pomeroy, LL.D. In three volumes. Vol. III. San Francisco: A. L. Bancroft & Co.

A Treatise on the Law of Sale of Personal Property; with references to the American decisions and to the French Code and Civil Law. By J. P. Benjamin. Fourth American, from latest English edition. By Edmund H. Bennett. Boston: Houghton, Mifflin & Company. 1884.

A Practical Treatise on Abstracts and Examinations of Title to Real Property. By George W. Warvelle. Chicago: Callaghan & Co.

A Treatise on the Law of Collateral Securities, as applied to negotiable, quasi-negotiable, and non-negotiable choses in action. By William Colebrooke. Chicago: Callaghan & Co.

A Treatise on the Limitations of Actions at Law and in Equity. By H. G. Wood. Boston: Soule & Bugbee.

THE plan of Mr. Lawson's treatise resembles that of Sir James Stephen's 'Digest of the Law of Evidence,' and it will be a sufficient recommendation of his work to most readers and practising lawyers that he has found it possible to reduce his body of law to 116 short rules. The illustrations, of course, swell the book to the size of an ordinary legal treatise. The work appears, so far as we have examined it, to be carefully done. It is not possible that books of this sort should supersede the regular text-books, which aim at collating all existing authorities. The rules are subject to local variations and modifications with which a lawyer actually engaged in the trial of cases must familiarize himself from some source. Thus a lawyer trying a will case in certain courts would find rule 64, sub-rule 4, misleading. It reads as follows: "One not an expert may give an opinion, founded on observation, that a certain person is sane or insane." This is no doubt the true general rule to be derived from the cases, and the author mentions the courts of four States only as refusing to recognize it But the rule as given by him does not express the law of New York on the subject, as we understand it. In this State a witness not an expert is not asked to give an opinion, founded on observation, that a certain person is sane or insane; but the facts as to the behavior or acts observed having been drawn from him, he is then asked whether in his opinion the behavior and acts were those of a sane or insane person; it is only an expert who is asked the direct question as to insanity. The distinction is of course, so far as results go, unimportant; but, as a matter of practice, a lawyer who should fail to understand it would be tripped up at once. Mr. Lawson's analysis of the rules governing ordinary "opinion" evidence is particularly good. This is very far removed from expert evidence strictly so called. When a real-estate broker is called to testify to the value of "lots," or an archæologist to the probable antiquity of an "eight-legged dog," he is, properly speaking, an expert, for his evidence is based on special study of these particular matters. But a witness who states that he believes a person known as the Claimant to be really the lost Sir Roger Tichborne, has made no special study of claimants, or baronets, or of the means of identifying faces after a lapse of years; and what he says is a simple inference from observation, only a little more complex than the inference that it has been raining from the fact of the ground being wet. The line between fact, opinion, and inference is very hard to draw.

Ten years have elapsed since the last edition of the late Professor Parsons's elaborate and well-known work on contracts appeared—a fact made patent, on opening Mr. Kellen's edition, by his copious annotations. Five thousand cases have been added, and added in such a way as to take up little room. As far as we have been able to examine the new editor's work, it has been well done, and greatly adds to the value of a text-book which every lawyer must constantly consult. Of the original treatise, while not exactly a classic—not a work that can be compared with Kent, or with Story at his best, or with Greenleaf—it may be termed one of the indispensable law-books. There is nothing which exactly takes its place on either side of the Atlantic. We doubt if a lawyer ever feels that he has thoroughly worked up a difficult case turning upon a question of contract, without looking carefully to see whether he cannot find something to his purpose in Parsons. The text is now thickly overlaid with notes, which frequently obscure rather than illumine the path of the inquirer.

Mr. Heard's precedents form a valuable collection for the practitioner in Massachusetts, and probably other States. They are drawn in conformity to what he calls the "modern school of equity pleading," which teaches brevity and intelligibility. It is to the layman, no doubt, strange that there should be any school of equity pleading in the modern world at all. We have done what we can to rid ourselves of it by the fusion of equity and law, and the simplification of pleading in general. But it appears that there is still room for the equity pleader, whose art, however, now mainly consists in the skill and terseness with which he states his case—a rare art, even among good lawyers, and rarer than ever in our day, owing to the fact that the facility of amendment at all stages encourages ignorant and careless lawyers to trust to any sort of bill or declaration. The modest suggestion of the *Lord Chancellor,* in "Iolanthe," as "an old equity draughtsman," that a statement might be improved by the insertion of the word "not" before the verb, is no bad burlesque of many an amendment to pleadings, introduced as a happy afterthought by lawyers who are astounded to find that the case they have made is not their case at all.

Dr Wharton is one of the most voluminous legal writers of our day, and his books on some of the commoner heads of the law, such as Negligence, for instance, have proved of great value to the profession. He is an industrious collector of cases, and makes up by his thoroughness in this way what he lacks in thoroughness of another sort. He has no special qualifications for writing on Law in general. He has made the present volume valuable by incorporating in it a "suggestive" discussion of the recent amendments to the Constitution. But it would require very unusual legal abilities to embody in a brief treatise of a few hundred pages a general view of Law—international law, public and private, and constitutional and statutory law. Dr. Wharton has neither the accuracy of mind, nor the power of concise statement, which would enable him to do anything of the kind. On the first page we find ample proof of his want of qualification in this respect for his task. Speaking of the fact that the different senses in which the word "law" is used frequently leads to confusion, he gives the following as an illustration: "We have frequently presented to us an argument which may thus be expanded into a syllogism: 'It is a law that all acts of an intelligent agent were intended. *This* was the act of an intelligent agent, therefore it was intended.' The fallacy in the syllogism here proposed is that 'law' in the major premise is a law of psychology, and that at the best it justifies only probable conclusion, while the conclusion given is announced as an absolute law of jurisprudence." In order that there may be no misunderstanding about it he adds, "To this fallacy are attributable the erroneous rulings of our courts that it is a presumption of law that all acts done were intended." It is a pretty grave charge to say that courts of justice hold as an "absolute law of jurisprudence" anything of the sort. If they did the consequences would be very serious; for it would preclude any one accused of crime from excusing himself by showing that the act for which he is indicted was the result of mere carelessness and had no criminal motive, and was not committed intentionally. The rule which Mr. Wharton has in mind is apparently that every one is held responsible for the consequences of his acts so far as they affect his neighbor's rights; that is, a man who damages his neighbor's property, or slanders him, must answer to him for it, and cannot plead in excuse that he intended nothing of the sort. This is one of the most ordinary rules of conduct, without which the affairs of the world could not go on for a day, and has extremely little to do with "psychology." But even it has not been made an absolute law of jurisprudence.

Mr. High is a careful writer, and we are glad to see that his book on extraordinary legal remedies has reached a second edition. In ten years there have been eight hundred decisions added to the field, and these are now embraced in the treatise. We are unable to find any discussion of the question recently mooted in the courts of this State—the right to compel a railroad to receive and carry freight, by mandamus, when its excuse is that it is unable to have the work done except by paying an exorbitant price for it; nor do we find any account of the attempt in the Federal courts to use mandamus for the purpose of compelling States to pay their debts.

We have frequently spoken of the value of Mr. Freeman's collection and of his notes to the practising lawyer. The cases re-reported are to be found in the regular series, and no one can rely on a selection of cases in searching for authorities, for the simple reason that it *is* a selection, and therefore incomplete. Mr. Freeman's notes, however, taken in connection with the rest of the work, make the whole a gigantic set of leading cases accompanied by annotations, on a scale such as has never before been attempted. In such a set the gloss is the principal thing, and here we think that many of Mr. Freeman's notes are too "scrappy." A case that is worth annotating at all is worth annotating fully.

Mr. Merwin's treatise will be found of the utmost value to patent lawyers. Its scope is narrow, for, as the title indicates, it is confined to the subject-matter of patents, and the right to them as between rival or successive inventors. The topics of Abandonment, Infringement, and Reissue are consequently excluded. The body of the work consists of cases decided by the courts, but these are accompanied by a brief statement of the principles which they illustrate, admirably concise and clear. Mr. Merwin has

remarkable power of statement, and we can commend his book to the profession.

Mr. Jones has added some three hundred cases to his work on chattel mortgages, and in his treatise on pledges has covered a comparatively new field. The custom of pledging "collaterals"—that is, of stocks, bonds, bills of lading, warehouse receipts, and other paper securities—has produced a vast body of law on which the old treatises on bailments throw little light. Mr. Jones is a careful and accurate writer, and his work may be relied upon, not as a mere repository of decisions, but as embodying much research and knowledge.

We have spoken before of the earlier parts of Mr. Pomeroy's work on Equity Jurisprudence. The present volume completes it, and confirms us in the opinion that it is the most important treatise relating to Equity that has appeared since Story's time. It is especially valuable in its citations of recent leading cases; and an examination of very recently developed heads—as for example that concerning the liability of directors for malfeasance, misfeasance, or negligence—warrants us in saying that Mr. Pomeroy has searched the reports with great care and unusual discrimination.

Benjamin on Sales is a classic, and is likely to remain so for some time. Mr. Bennett has added a thousand cases and a good deal of valuable illustration; but the book is already getting unwieldy with notes. Swollen to more than a thousand pages, it very much needs revision by the author, if this were possible. Unfortunately, his health precludes him from the task, or thus far has done so. So well, however, was the work originally performed that it will be able to stand a good deal more annotation—at least, if as well done as Mr. Bennett's.

A very large part of Mr. Warvelle's treatise on conveyancing is made up of matters treated more fully in books relating to the substitution law of real estate. It might have been made much smaller with advantage. Singular as the fact may seem, the statement of the author that it is the only American treatise, with the exception of a little handbook, on the subject, is, we believe, entirely true. The book will be found chiefly useful in conveyancing in the Western States, where real law is entirely modernized.

Mr. Colebrooke's treatise is a valuable collection of cases, but it lacks precision and accuracy of statement, as for example in his treatment of evidence bearing on "option" contracts, where (§350) hardly a single decision is stated so as to be thoroughly intelligible.

Over 250 pages of Mr. Wood's treatise on limitations are taken up with the statutes of England and the United States. As he says in his preface, the legislation of the last twenty years has produced radical changes in the law and in the theories applicable to the law of limitation. There is no other book which goes over the ground as thoroughly as this treatise.

A Memorial of George Bradburn. By his Wife. Boston: Cupples, Upham & Co. 1883.

GEORGE BRADBURN'S name is little known to the present generation, to whom it is necessary to say first of all that he was a Massachusetts man. "Bradburn of Nantucket" he was called during his brief but conspicuous and highly useful term of service in the lower house of the Legislature of his native State; but he was not, in fact, born on that island, and only chanced to be settled there as a Unitarian clergyman. Like many another of his profession, the anti-slavery agitation swept him out of the pulpit into the broader current of moral activity. He became associated with it in 1839, on the eve of the second stage of its development, and amidst the great division in the abolition ranks caused by sectarian jealousy, hostility to the equal participation of women, and a desire to convert the organization into a disciplined party at the polls. The first two motives had no weight with Mr. Bradburn, and being chosen one of the American delegates to the World's Anti-Slavery Convention held in London in June, 1840, he defended vigorously, but in vain, the right of the female delegates who accompanied him to be recognized and admitted to seats on the floor. When the second stage of the agitation was reached, and the policy of disunion adopted by the abolitionists, Mr. Bradburn withdrew in his turn, yielding assent to the sophistical reasoning which made "the Constitution as it was" an anti-slavery instrument. After that his associates were the political abolitionists, the Liberty Party men, Free-Soilers, and Republicans, and his occupation became that of an editor, first at Lynn, Mass., afterwards in Boston, and finally in Cleveland, Ohio. He stumped the West as a Republican orator till his health broke down in the Fremont campaign, when he returned to Massachusetts, for a brief period resumed his ministerial functions, and then, thanks to the friendship of Secretary Chase, found a position in the Boston Custom-house, which he held as long as his faculties permitted. He died in 1880.

This intimate memorial is a medley of autobiography (in the shape of letters, journals, and commonplace book), narrative, extracts from speeches, lectures, and sermons, and personal tributes, from all which a very good idea can be got of the subject. Two excellent portraits, early and late, recall a presence singularly imposing and benign. One lacks only the perishable quality of the orator's delivery, which in Bradburn was sympathetic, humorous, and pungent in a high degree, and all the more remarkable because of his deafness. We can readily believe that Mr. George Ticknor Curtis advised him to betake himself to the law, encouraging him to think that he "could gain admission to the bar by a rather short cut." "I told him," observes Bradburn, "what I had on a certain occasion told the House, that I had always fancied there might be more of the law in my composition than of the gospel." The most interesting and, from an historical point of view, the most important portion of this volume is Mr. Bradburn's European diary, especially in what relates to the World's Convention. For natural description he had not the graphic pen of his friend and fellow-delegate, N. P. Rogers, but his impressions of the eminent persons whom he met are acute and valuable. Everywhere he carried his Yankee yardstick, and was surprised to find it more at variance in the land of roast beef than in that of the metric system. He crossed the Channel, and saw in Paris the decade celebration of the Three Days, and was at Boulogne only a day or two before Louis Napoleon's fiasco. Before reaching Paris—

"I see," he says (p. 100), "a hundred things in France to one in 'Old England' to remind me of America. The sky, the earth, its cultivation, the people, the animals, all look more American than any I have seen since leaving home And herein I have been disappointed: I fancied we and our country resembled in outward aspect the English more than the French. Yet I notice here things strikingly dissimilar to aught among us."

It is hard to choose from the abundant passages we have marked for quotation. Lord Brougham, Dr. Bowring, Harriet Martineau, Haydon (to whom Bradburn sat to be painted as a member of the Convention), Father Mathew, are some of the famous personages of whom we here have characteristic sketches. Let us cite what is said of O'Connell (p. 71):

"The great 'agitator' is all that I expected, and more. His person is uncommonly large, erect, and of admirable proportions, while his feet and hands are of very aristocratic dimensions. His voice is exceedingly rich and of great compass and flexibility. Its tones fall on the ear like notes of sweetest music, or the thunder of a tremendous cataract, just as he pleases or as best comports with his subject. Something of the Irish brogue it of course has, but that makes it all the richer. To look at him as he sat listening to Clarkson's speech, one would hardly deem him the agitator he is. There is such an expression of placidity, of cheerfulness, of a mind at ease with itself, in his ample, roseate countenance, that one can scarcely help feeling happy in the observation of it. . . .

"Mr. O'Connell having made a complimentary allusion to Massachusetts, I was urged by Wendell Phillips to respond to it It was the best opportunity I ever had of showing my littleness."

Here is the portrait of a very different kind of orator (p. 118):

"I visited an assembly of three hundred divines, more or fewer, now in town [Edinburgh], where the matter 'was up' of the Church's independence. I asked Dunlop to let me try if I could identify Dr. Chalmers in this great crowd of persons. I succeeded, and by my phrenology alone; for apart from the reverend doctor's cerebral configuration there was nothing peculiar in his person corresponding to any preconception of mine. He has the look of a brawny yeoman. I heard him speak at some length in the debate, or tried to, rather, for I was at too great a distance to understand much that he said, and probably was but poorly compensated by reading a report of his speech in the morning papers. His manner was earnest and ungainly. He held his cane in one hand, clutching it near midway and cutting the air with it, in outrageous violation of *Hamlet's* advice, the perspiration standing in big drops on that noble forehead and embrowned face. George Combe has modified my opinion of the merits of this church battle, and quite destroyed the sympathy I had felt for these clerical warriors against secular interference with the rights of churches, by showing that the special object of their hostility is, under the circumstances, favorable to the growth of religious liberality."

Under date of August 2, 1840 (p. 104):

"Went to Chelsea with Professor Adam. Alas! that extraordinary writer and steam-engine sort of thinker, Thomas Carlyle, had left here only a few hours before for a few days' 'rustification' in the country. His pleasant, bright wife talked with us an hour or two, and made us laugh at her graphic description of her husband's outfit and departure, who, it seems, had left on an old Rosinante with saddle-bags filled with maps of England, tobacco and pipes. She showed us a picture in oil of him. 'Twas only the head and a portion of the neck, having a remarkably healthful Scotch look and a massive forehead. Mrs C. said he was much pleased with the Quaker lady—Mrs. Mott—whose quiet manner had a soothing effect on him. She spoke of her husband's regard and respect for Ralph Waldo Emerson."

At another Scotchman's Mr. Bradburn encountered that dangerous adventuress who caused a fluttering among our ingenuous Congressmen half a century ago (p. 112):

"He introduced me to Miss Americus Vespucius, the only living descendant of the alleged discoverer of America. She returned not long since from a visit to America, where an effort was made to obtain for her a national donation as an expression of regard for her illustrious ancestor. That effort having failed, numbers of 'patriotic' individuals made her the offer of a handsome pecuniary present, which, however, she declined to accept, thinking it might have been proposed under an impression that she needed assistance. A more captivating woman I have never met. There is a witchery about her that is irresistible, that even Zeno himself could hardly have withstood the influence of. The Duchess of Sutherland struck me as being as elegant and perhaps the most beautiful woman I had ever seen; but these are not the epithets applicable to Vespucius. She is exquisitely pretty and fascinating. The Italian is much the younger, apparently, has a more delicate, slender form—sylph-like, indeed—more grace and sprightliness, a dark complexion, a profusion of dark hair, and very large, flashing eyes, whose

beauty is heightened by their long silken lashes. But what is better, her mental qualities are of a superior order. She has great conversational powers and speaks several languages. And with all these charms of person and superiority of intellect, she is said to possess another quality, not infrequently found in the fairer part of creation. It is an Amazonian courage, of which Dr. Madden told me she once gave a singular proof, by pistolling a Frenchman who had dared to insult her. She has been for some time an exile from her native Florence on account of her political opinions."

If space permitted, we should like to quote from Mr. Bradburn's "lecture on education relating to classical studies," which we commend to our anti Greek champions as a weapon to their hands. The date is not given, but Harvard was already an innovator by making the classics elective in a certain portion of the course. Brown had followed her example, and Yale was preparing to do so. In conclusion, we may express a regret that more of Mr. Bradburn's own letters were not collected and here printed by his widow; for, as every one knows who has met with them in private collections, they abundantly confirm Gerrit Smith's praise of them to the writer (p. 175): "You remember my telling you that none of my correspondents succeeded to anything like the extent you do in putting *themselves* into their letters. A letter from Bradburn is a *visit* from Bradburn."

A Book of New England Legends and Folk-Lore, in Prose and Poetry. By Samuel Adams Drake. Illustrated. Boston: Roberts Bros. 1884. Pp. 461.

THE title chosen by Mr. Drake is too narrow for the size and contents of his work. Thus, the folk-lore is chiefly confined to the introductory essay of six pages, and there is hardly a legend, in the proper sense of the term, till Essex County is reached—say, for another hundred pages. History, both sober and romantic, has a larger space allotted to it than tradition, a strict adhesion to which would have resulted in a much thinner volume, even if the "New England" were enlarged to mean something more than a little strip of the Eastern coast. Mr. Drake is an inveterate moralizer, and he sometimes forgets that he has a story to tell, "talking all round it." This is conspicuously true in the case of Eliza Wharton, the natural mystery surrounding whose fate is much enhanced by the failure to give a concise narrative of what is known about this unfortunate woman. And in general, Mr. Drake's style is needlessly diffuse and suggestive of the bookmaker. To this class he indeed belongs, and with a certain distinction, which lies more in the felicity of motive of his several ventures than in the skilful literary execution of them. When we add that the pictorial illustrations are occasionally apropos of nothing, we have ceased finding fault with a book which we welcome with all its shortcomings, because it is well calculated to interest the young in the history of Puritandom, and to recall pleasantly to their elders, who were to the manner born, the familiar tales of their childhood. What exiled Bostonian, for example, forever longing to return and never being able to get to the "Hub," can read without a thrill of self-recognition Austin's clever allegory of "Peter Rugg, the Missing Man"? The poets principally drawn upon are Whittier above all, of course: Longfellow, Lowell, Dana, and that interesting group of Essex County poetesses—Hannah Gould, Lucy Larcom, Celia Thaxter, Harriet Spofford—on whom the local scenery has exercised the same magical influence as on the Quaker poet. The arrangement of the contents is geographical and chronological, and the book is beautifully manufactured.

Mumu, and the Diary of a Superfluous Man. By Ivan Turgeneff. Translated from the Russian by Henry Gersoni. Funk & Wagnalls.

THE wish has been often expressed for an accurate translation of Turgeneff's writings direct from the original. That none of his countrymen have undertaken it goes to emphasize the doubt expressed by Wallace as to the aptness for foreign languages usually ascribed to Russians. The two sketches before us do nothing to supply this want. They only prove how many of the words of a language may be acquired without any perception of their relative values, their effects on tone, either artistic or moral. The mistakes are so extravagant as to be ludicrous, in spite of the respect due to the devoted enthusiasm of the translator for his author.

Mere justice prompts a like warning as to the sketch recently reprinted in *Littell* from the *Scottish Review*. It is known in French as 'Les Reliques Vivantes,' and is of a kind in which Turgeneff was unrivalled—the simplest monologue, into which he could throw a whole passionate drama without forcing a single note, without a false tone in the faint, sweet melody. One example will suffice to show at once the inflation and the degradation which the original has suffered. Turgeneff says only, "I wondered to myself where, in such shape, she had found the legend of Joan of Arc." Out of that the translator has evolved: "I own that the transmogrification which the history of Jeanne d'Arc had undergone in penetrating to Alexeïevka caused me some astonishment." It is not enough to say that Turgeneff had mastered style, that his own was perfect in artistic simplicity and refinement. He was himself, to the utmost, high-bred—gentle to the last fibre.

Samuel Davis, of Oxford, Mass., and Joseph Davis, of Dudley, Mass., and their Descendants. North Andover, Mass.: Geo. L. Davis. 1884. Pp. vii. and 610.

THIS is a large and careful record of the issue of Samuel Davis, who was a grandson of William Davis, at Roxbury, in 1642, together with a shorter account of the issue of Joseph, son of the emigrant. It is in one respect a valuable genealogy, for the dates are given with due exactness. It is, however, intentionally excluded from a place among the best of such works, by its plan. The descendants of Davises in the female line are included in the record and in the arrangement; so that the book is mainly composed of little fragmentary bits of the history of many families.

The author says that he does this knowing that it conflicts "in a measure with the dictum of professional genealogists" That *dictum* is based upon the common-sense idea that every family, since the establishment of hereditary surnames, is confined to those bearing the name. In Great Britain, indeed, a desire to claim relationship with the blood-royal, or even the nobility, leads many persons to trace descent by the spindle side. With us, on the contrary, the better idea is to aim at a correct picture of the increase of the clan. Of course, a book like this entirely obscures that result, and renders the vast collection of no interest to the statistician, and of trifling value to the genealogist. It is a pity to see so much labor and zeal misspent. Had the author arranged the records of a single town, by families, he would have laid us under an obligation.

BOOKS OF THE WEEK.

Allen, Grant. Flowers and their Pedigrees. D. Appleton & Co. $1.50.
Amidon, Dr. R. W. A Year-Book of Therapeutics for 1883. G. P. Putnam's Sons. $1.50.
Bancroft, G. History of the United States of America. Vol. IV. D. Appleton & Co. $2.50.
Bardeen, C. W. A System of Rhetoric. A. S. Barnes & Co.
Brownson, H. F. The Works of Orestes Brownson. Vol. VI. Detroit: Thorndike Nourse. $3.
Busch, M. Unser Reichskanzler. 2 vols. B. Westermann & Co.
Conway, H. Called Back. Leisure Hour Series. Henry Holt & Co. $1.
Dynamic Electricity. Including articles by Dr. John Hopkinson, J. N. Shoolbred, and R. E. Day. Science Series. D. Van Nostrand. 50 cents.
Easter Flowers. Arranged and illustrated by Susie B. Skelding. White, Stokes & Allen. $1.50.
Egleston, N. H. Hand-Book of Tree-Planting. D. Appleton & Co. 75 cents.
Goldsmith, Oliver. The Vicar of Wakefield. Preface and notes by Austin Dobson. Parchment Library. D. Appleton & Co. $1.25.

Henry Holt & Co.

WILL PUBLISH SATURDAY:

Life and Poems of Theodore Winthrop. Edited by his Sister. 12mo, with portrait. $1.50.

Messrs. Henry Holt & Co. publish Winthrop's Novels in the Leisure Hour Series. 16mo, $1.00 *per volume.*

JUST PUBLISHED:

Called Back.

A fascinating novel. 16mo, Leisure Hour Series, $1.00; Leisure Moment Series, 25 cents.

The Pagans.

16mo (No 2 American Novel Series), $1.00.

A Latter-Day Saint.

Being the Story of the Conversion of Ethel Jones, related by herself. 16mo (No. 1 American Novel Series), $1.00.

THE QUEEN OF ROUMANIA'S

Pilgrim Sorrow.

A Cycle of Tales by Queen Elizabeth of Roumania. Sq. 12mo, *with an etched portrait by Lalanze.* $1.50.

George Washington.

By John Habberton, author of 'Helen's Babies,' etc. No. 4 in the Series of Lives of American Worthies. 16mo, $1.25.

"We heartily commend the volume to young and to old. It is veritable history, but it is history in undress and not in court clothes."—*The Churchman.*

The Nation.

NEW YORK, THURSDAY, MARCH 20, 1884.

The Week.

THE only important event of a business character during the past week has been the action of the Trunk Line Pool in reducing rates on grain and provisions, from Chicago and other Western points to the Atlantic seaboard, ten cents per hundred pounds. This is the last remedy in the hands of the pool managers against the cutting of rates. It is also the first application of the remedy made since the present pool went into operation. If vigorously followed up it will undoubtedly accomplish the object in view. It will reduce railroad earnings as a matter of course, but much less than a general war of rates, which is the only alternative, would reduce them. The effects of the reduction on general trade remain to be seen. They ought to be beneficial, by way of putting some life into our sluggish export trade in grain and provisions. Gold shipments have practically ceased, only $200,000 having been sent out during the week. It would be premature, however, to say that we shall lose no more, although the reduction in grain rates from the West, taken in conjunction with the lowering of the discount rate by the Bank of England, seems altogether likely to keep sterling exchange below the gold-exporting point. The movement of general merchandise has not improved materially, but prices of dry goods have been well sustained. The same may be said of the iron trade. The advance in pig iron established a few weeks ago is maintained, but sales are light. There is no activity in any branch of the trade. Railway earnings for February, as compiled by the *Financial Chronicle* for sixty roads, show a small gain. Business in the Stock Exchange is still confined to large speculators and their following of room traders. All attempts to lure the public into the market seem to have been definitively abandoned.

The dinner of the Free-Trade Club on Saturday evening was the most notable gathering in the interest of tariff reform that has taken place in this country since the close of the war. It was notable in the character of those who were present and took the leading parts, but more especially in the spirit of the proceedings. Those who have been in the habit of attending such meetings from time to time during the past fifteen or twenty years could not fail to observe an invigorating atmospheric influence quite unusual in their former experience, betokening a general conviction that some step is about to be taken toward freer trade with the world. The most significant and important speech of the evening was that of the Speaker of the House of Representatives, whose words were, of course, weighted by the responsibilities of his position. Mr. Carlisle did not employ any equivocal phrases. He left nobody in doubt as to his beliefs, intentions, desires. There must be a change in the policy of the country; there must be a reduction of duties, a relaxation of the restrictions hitherto imposed upon foreign trade. The measures taken to effect this change must have due regard to investments already made in particular branches of industry, but these branches of industry must put themselves in shape to meet the change, for there can be no step backward. A foreign outlet for our surplus products, both agricultural and manufacturing, must be found. Tariff taxes are an obstacle to foreign trade; they are designed for that purpose, and they accomplish it to a large extent. They must be removed—decently and in order, but they must be removed. This is what Mr. Carlisle's election as Speaker betokened, and he did not belittle its significance in the smallest degree. It was refreshing, as another speaker remarked, to listen to a man in high political station about whose position there could be no mistake. Mr. Carlisle's speech will have a profound influence on his party in the way of assuring all doubters that there is to be no backdown on the part of those who have brought forward the Morrison bill. This measure is moderate and reasonable. It has been sanctioned in principle by the Republicans themselves. If the Democratic party is to split upon it, let it split.

It is of course easy to exaggerate the importance of the passage of a measure like the Roosevelt bill, and we have no desire to do so. Much remains to be done, even now that it has become a law, to purify the politics of this city and make its government decent; for making its government really decent means the complete transfer of it from the Mikes and Johnnies who now carry it on, to the class on which in the long run the welfare and progress of the community depend—the honest, the saving, and the industrious, who have converted New York from what it was a generation ago into a great modern capital, and that in spite of the most shocking misgovernment and pillage by its political class. The centre of their power has always been in the cumbrous political machinery, handed down from the middle ages, which, originally designed to insure free municipal institutions, has come in our time to make city administration a burlesque. The goal to which all modern cities tend, and to which New York has long been tending, notwithstanding all its misfortunes, is freedom from "politics" so called, and efficiency of administration. The Mayor and the departments have been gradually vested with nearly all the powers which the Mayor, Common Council, and Aldermen once enjoyed. The old mediæval concern has meantime been dying of atrophy, caused by our gradually taking away its nourishment. The Common Council withered away years ago; most of the functions of the Aldermen went too; and, now that their control over appointments is gone, the work may be said to be complete, and the time has come when we may turn our eyes to the real government of the city, as it will exist in the future, the essential features of which are to be the election by universal suffrage of a single executive head, vested with absolute power of appointment, and held responsible for its exercise.

Mr. Roosevelt's Committee made a unanimous report to the Assembly on Friday. It is the more interesting that it relates not to confessedly political bodies like the commissions, but to the minor administrative machinery of this city, which has to be conducted with a certain amount of regularity, honesty, and efficiency. The way in which it is actually carried on appears from the following facts: The books of the County Clerk, Keenan, show that he has received $13,700 in fees, which the law requires him to turn over to the city, but which he has put in his own pocket, and this is said to be the "practice" of the office; Keenan's predecessor, Butler, having kept $36,620 50, and Keenan explaining that it is done under "advice of counsel." The Clerk gets as his net income $80,000. His entire term of office yields him $250,000, but a large part of it is "turned over to the various political organizations" from which he gets his place: in other words, he buys the place, and pays for it by fees which are supposed to pay him for doing the work of Clerk. Finally, he does not do this work at all, his time being taken up with politics, as the Committee says he admitted with "great frankness." The work is of course done by some of his subordinates, and the community is taxed $250,000 by every County Clerk to keep up this wonderful system. The Register, who keeps the records of deeds and mortgages, does not know what his income is, and has forgotten whether he paid more or less than $50,000 for his office. The Committee found it impossible to ascertain what the office is really worth to the incumbent, for the books were removed by the late Register, Mr. Docharty, who was suddenly obliged to leave the city by severe illness. The clerks and subordinates, with the exception of a few copyists, are the private employees of the Register, and not in the pay of the city at all. The fees paid amount to $75,000 or $80,000 a year, the money being used, first, to pay for the office, and then to pay Mr. Reilly for keeping his little bureau in working order.

The clerical part of the Surrogate's office is "largely run by his subordinates simply for the purpose of blackmail." At least $10,000 a year, and "probably a sum vastly in excess of this amount," is extorted from those whose property passes through the Surrogate's hands, for services of one sort and another, for which the clerks are already otherwise paid. Except in one instance, no account is kept of these fees. All this is the more easily understood when we learn that the clerks are not employed or paid by the Surrogate, but by the Aldermen. These Aldermanic henchmen let out desk-room in the Surrogate's domain to their friends, who, without holding any public office, perform public work on their own account and at their own rates; those who use the

office of course taking them for clerks. The Committee sum up their picture of the Surrogate's office in the remark that the first step in getting any work done there is "to bribe the employees." The Sheriff's office is a great nursery of blackmail, which seems unnecessary, as the Sheriff receives an enormous quantity of fees every year for services which it costs him "almost nothing to perform." For instance, he fills in blanks, which could be done by a clerk at $1,500 a year, for $26,299; the compensation here again being fixed in the funny way noticed already, by the Aldermen, at what they think a "reasonable" figure. The conveyance of prisoners to and from jail cost $23,109 last year; the Aldermanic rate being $1.75 a head, or more than 25 cents a city block. The Sheriff feeds his prisoners at a profit of $14,000, makes $3,600 by serving notices on jurors, and pockets $600 whenever a criminal is hung. He clears about $60,000 a year. With regard to his jail in Ludlow Street, the Committee report that it is in a "revolting and almost incredible" condition; the keepers being "drunken and brutal," and making a living out of the wretched prisoners by a "thorough system of extortion and blackmail."

The Fitz John Porter case is at last at an end, the bill for his relief having passed the Senate on Thursday by a vote of 36 to 25, after another speech from General Logan, which, however, produced nothing new. The case is one of the most remarkable on record, not more for the persistence with which General Porter has maintained his struggle, than for the success he has had in keeping the interest in it alive. As a general rule, a man with a grievance twenty years old becomes a bore, to whom people listen wearily; and there is no similar body in the world more indifferent than Congress to tales of ancient wrong. It rarely, indeed, does tardy justice at all. But Porter has surmounted all these difficulties, and in addition has managed to beat down a vast amount of passionate prejudice, the maintenance of which many people had come to think part of their duty to the country, and to the memory of those who perished in the war. The whole case against him hung, in the last analysis, on the theory that a professional soldier who did not like or who distrusted his commanding officer, would necessarily be quite ready to betray the Government he served and the soldiers who fought under him. The evidence produced against him would have had no value whatever without this theory, and for the theory there is no support in military history. It was hatched in the brain of politicians, and it is really they who have kept it alive till now.

Mr. Blaine's canvass has reached that familiar stage where it becomes necessary to set him right with the religious sentiment of the country. His organ in Philadelphia announces that during the past fortnight it has "received a score of inquiries on the subject," and that while the religious opinions of a public man, especially of a public man who has retired from politics, "are not a fit subject for public discussion," still the "malicious spread of misconception" cannot be allowed to pass unnoticed when complete refutation is at hand. Accordingly that "indignant private letter" which Mr. Blaine wrote to a personal friend in 1876 is produced in full, with its memorable passage about the charge that he is a Roman Catholic being "very exasperating when connived at, if not in fact originated, by men who sat with me in a Presbyterian Bible class when I was a student in Washington College." We presume that the letter is reproduced now, not so much for any effect which it may have in the preliminary Presidential debate, as to ward off the possibility of injuring the "history" by impeaching its unsectarian fairness.

Some heedless person, who has no comprehension of the great subject with which he is trifling, has given to the newspapers advance sheets of the tenth chapter of Mr. Blaine's history, and some of them have published the whole of it. For some inexplicable reason, the chapter is generally treated as a campaign document rather than as the calm and judicial narrative of a historian who has withdrawn forever from the heat of political strife. Democratic journals call it "Blaine's bid for the Presidency," and Blaine organs go into raptures over its beauties of diction and breadth of view, which can only be accounted for on the supposition that they are unaware how painful this prema ture publication must be to the sensitive mind of the distinguished author. The chapter deals with the period just preceding the civil war, and is devoted mainly to a consideration of the way in which the South was led into secession, to Buchanan's character and administration, and to a "pen portrait" of Jere Black. Concerning the style of the author, we cannot do better than quote the following restrained description from the editorial columns of Mr. Blaine's devoted organ, the Philadelphia *Press*: "The author combines in one the political leader, the experienced man of affairs, the orator, and the trained writer whose clear-cut, forceful sentences lose nothing of their charm, though the graces of voice and person be absent and the words presented in cold type stand alone to challenge the admiration of the reader. In vastness of subject and breadth of treatment neither the 'Notes' or 'Writings' of Jefferson, the autobiography of Franklin, the 'Thirty Years' View' of Benton, the diary of John Quincy Adams, nor the modern writings of Henry Wilson, Sumner, or Seward can compare with the work which Mr. Blaine has taken upon himself." It is a cause for infinite regret that so important a contribution as this to historical literature should be paraded before the world as if it were a mere stump speech of an incurable Presidential aspirant. Not only is Mr. Blaine's standing as a historian injured thereby, but his sagacity as a politician is impeached by the inference which is given that he thinks a successful run can be made for the Presidency on the issues of Buchanan's administration. Undoubtedly his publishers are responsible for this indiscretion, and he will only serve them right if he takes the "work" out of their hands forthwith.

The Advisory Council called to settle the dispute in the Newman church have rendered a decision which has the rare merit of delighting both sides. Dr. Newman says he considers "the victory on his side," and Dr. Ranney says he "never was happier in his life." The main issue which the Council was called on to decide was, whether Dr. Newman is the permanent and settled pastor of the church or not. The Council has decided that he is not, which is what the Ranney party have been contending for. He is, the Council says, simply the acting pastor. Whether the Ranney dismissal of him on the 14th of February is valid or not, the Council does not say, but advises that this point be reconsidered at another meeting. The whole trouble seems, indeed, to have originated in Dr. Newman's refraining from any such formal and regular acceptance of the call of the church as would take him out of the Methodist Episcopal Church, with which the Council finds he is still "in full connection," and to the discipline of which he is still amenable, as "a located preacher in the Quarterly Conference of the Methodist Church."

The bill which passed the Assembly at Albany on Monday, virtually lowering the fares on the elevated railways by extending the five-cent hours, does not commend itself to principles of justice. It has not been called for by any general demand on the part of those who commonly ride during the ten-cent hours, nor would such demand if made furnish a good reason for passing the bill. The elevated railways are not owned by the people who ride on them in the ten-cent hours. If they were so owned it would not be necessary to ask the Legislature to pass any bill on the subject, as the matter would naturally be arranged in a stockholders' meeting. But these non-stockholders who go down town late and go up town early have not "moved" for a reduction of fares. They have held no meetings, passed no resolutions, written no letters to the newspapers, taken none of the steps which betoken an earnest desire to have the fares reduced. Notwithstanding all this, it would be proper for the Legislature to take the matter under consideration at any time if it were clear that the power to fix the fares (regardless of earnings) resided in that body. It may be that the Legislature has, by some inscrutable process, acquired such power, although it was not conferred or reserved at the time when the charters were granted and the railways were built. It was then expressly understood and agreed that the rates of fare fixed in the bill should stand until the net earnings should exceed ten per cent. upon the capital actually invested. Last year the Railroad Commission made a careful investigation of the company's condition, its cost, earnings, expenses, etc., and reported that it was not yielding ten per cent. upon actual cost. Notwithstanding all this, the Legislature passed the so-called Five-Cent-Fare Bill and the Governor very properly vetoed it. There has been no change in the facts since that time that the Legislature can take cognizance of. The earnings may have increased meanwhile, but that is by no means certain. It is certain that no new bill ought to be passed without a new investigation, and it is to be hoped that the Governor will veto this bill, if it reaches him, upon the

same conclusive and sufficient grounds as those upon which he vetoed the last one.

The gratifying intelligence is sent out from Philadelphia that all the "subordinates" who have been engaged for years upon the mysterious task of constructing the Keely motor have been discharged because their work is ended. Keely will from this date be shut up alone with the motor, and will devote all his energies to "focalizing and adjusting the vibrators." This is a delicate operation, we are assured, and would be a most difficult one for anybody except Keely. For him it will be mere child's play, and will end so soon as he obtains one revolution. Nobody can tell how long this will take, but the stockholders are to hold a meeting next Tuesday evening, when the date of an exhibition for their pecuniary benefit "will probably be announced." It is evident that the next few days will constitute a period of intense excitement to all interested in the mystery. The knowledge that Keely is imprisoned alone with his "motor," focalizing and adjusting it for the long-delayed action, will excite tears of joy and hope on every hand. The result of his week's labor may be a revolution which will relegate all other motors into the background, or it may be another postponement.

The case of Fullerton, the transfer clerk of the Manhattan Beach Company, who fraudulently issued 475 shares of stock belonging to the company, and obtained the money (about $45,000), which he is supposed to have lost at the card table, brings up in a new form the question of the liability of a corporation for the fraudulent acts of its agents. Probably the company in this case will not dispute the validity of the stock in the hands of any innocent purchaser, as it is not a case of overissue, but one of plain theft by an employee. There is a rule of the Stock Exchange which requires the witnessing of the signatures of transfers by a member of the Exchange, in order to make the certificates a good delivery to other members; but this rule cannot determine the legal liability of parties in cases of fraudulent issues. All the decisions of courts in cases like the present run to the conclusion that although a company cannot, through fraud or otherwise, make an overissue (which would be an increase of its capital without the authority of the Legislature), it is responsible to innocent purchasers for the value of any shares put in circulation by its own officers and agents, even though these shares are in excess of the whole number authorized by law. The shares fraudulently put out by Fullerton were not in excess of the total authorized issue, but were part of the company's assets. The case therefore seems to be one of mere embezzlement, in which the Manhattan Beach Company is the only sufferer.

The efforts of the Ohio Democrats to have the Scott Liquor Law superseded by some measure more pleasing to the liquor-dealers are not likely to succeed. Three caucuses have been held by the Democratic members of the Legislature for the purpose of enforcing united action in favor of a graded tax bill, which is drawn up in accordance with the demands of the liquor interest, but ten Democrats have refused to support such a bill under any circumstances, and their votes, combined with the Republican vote, will give a majority of five in the Assembly against it. As the Democratic caucus has adopted the bill as a party measure, they have made the necessary "record" for campaign uses, and that is the end chiefly desired. Under the Scott law the liquor trade is held in control much better than ever before, and the revenue which it brings to the State is a perceptible relief in lessening the burdens of taxation.

Mr. Frederick Whittaker, a popular author of whom few of our readers have probably heard, has come out in a long letter in defence of "dime novels." He says that he has written a great many himself, and that the prevalent notion that it is under the influence of the dime novel that the boy of the period takes to murder, arson, and highway robbery, is a delusion. He declares that the dime libraries are of all classes. "Some are stories of adventure by land and sea; others of workingmen's life; others are founded on history, like those of Scott; while others are of frontier life, and record the adventures of real men, like Kit Carson, Daniel Boone, and the well-known scouts of our own time. There is no mention of famous bandits, or of any of that sort of thing; yet their subjects are legion." If this is true, it looks as if the pure dime novel of our fathers is confused now, in the public mind and common speech, with some later and debased pieces of literature, from which it ought to be carefully discriminated; at any rate, Mr. Whittaker's letter shows that the recent editorial statement of the *Tribune*: "The work of the dime novel is being performed with unusual success. The other day three boys robbed their parents and started off for the boundless West," embodies a hasty inference. As a general rule, the reading done by a youthful criminal is only one of many causes which produce his downfall, and consequently, even if the American boy could be suddenly cut off by criminal legislation or a heavy tax from indulging a debauched literary taste, he would still be subject to manifold temptations, and would only here and there become entirely pure and good; while it is needless to say that there are many legal and economical difficulties in the way of any reform of the kind. The press must evidently labor cautiously and tentatively in this field.

Prince Bismarck has made in the Reichstag a characteristically clumsy explanation, in the nature of an apology, of his action in the Lasker matter. He adds nothing, however, to what he said in his despatch, beyond a repudiation of any unfriendliness to the United States. His plea is, in substance, as he himself expresses it, that he was not going to be made his "enemy's postman"—that is, the medium of transmitting a communication in which an enemy was in effect praised for his opposition to him. The discussion which followed indicated more clearly than ever that it is the Reichstag which he has offended, and that it is for the Reichstag to call him to account. We can do nothing more in the matter beyond calling him hard names; but this, even if it were seemly on such an occasion, would hardly mend matters.

Osman Digna has shared the fate of the commander at Trinkitat, whoever he was, by being badly beaten, in spite of his preaching and the fanaticism of his followers. It is lucky for the British, however, that the enemy was willing to make a stand at such a convenient distance from the coast. The details of General Graham's victory show that the tactics practised by the Arabs on the Egyptian squares were for a moment successful on one of the British squares—that is, a charge was made, under cover of the smoke, at one of the angles which held a Gatling gun, and the square was entered under the wheels of the gun, and a good deal of cutting and slashing done and confusion wrought inside. But the British loss shows that there was no great execution done by the attack after all. The force was exposed to a distant fire all the previous night, and to two hours' "hard fighting" in daylight, and had to stand the assaults of 10,000 desperate men, and yet the casualties all told only amount to 250. The proportion of killed (100) to the wounded is, however, very high, showing that the Arabs thrust home with their spears. The fact that the Arabs reached the squares at all, however, in considerable force reflects great credit on them as fighting men, and evidently calls for some revision of the received opinion about the powers of the breechloader. It was, and we believe is still, the judgment of all Continental military critics, that the fire of the British line is the most effective in the world, owing to the superior coolness of the men. It has been generally laid down, too of late years, that neither cavalry nor infantry can approach any body of troops, armed with breechloaders, who are not themselves under fire. That the Arabs should have charged with such impetuosity, therefore, as to leave heaps of dead just outside the square, is certainly an extraordinary exploit, unless the British soldier has greatly fallen off in the use of the musket. He never shot with precision at long range, but he has always made a fire which was "withering" within three hundred yards. Ability to run rapidly on all fours has probably had a good deal to do with the Arab success, and it is a bit of drill which might perhaps be profitably introduced into other armies. It would be very amusing at reviews.

The report is again renewed that the United States and England are to be called upon to mediate between France and China. There are a great many reasons why England should be called in; but our interest in Chinese commerce and the treaty ports is comparatively small, and the objections to action on our part numerous. Indeed, among protectionists it must be very doubtful whether we ought not to desire a blockade of the ports. It would help to make our commercial isolation more complete, and make us turn our attention more closely than ever to the development of our grand old coasting trade.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 12, to TUESDAY, March 18, 1884, inclusive.]

DOMESTIC.

ATTORNEY-GENERAL BREWSTER has sent a circular to all United States Attorneys and Marshals, by direction of the President, in which he says: "It is reported that certain persons are aiding in the prosecution of heinous crimes by shipping to foreign ports explosives dangerous in the highest degree to life and property. No proof has been adduced that this rumor is founded upon fact, and the President cannot believe its truth. The honor of this nation, however, requires that it should not be open to the imputation, unfounded though it be, of the slightest appearance of tolerating such crimes, whether to be committed against our people or those of other countries." He therefore calls their attention to certain sections of the Revised Statutes of the United States, which provide that any person transporting or delivering on board a vessel, engaged in carrying passengers between the United States and any foreign country, nitroglycerine and other dangerous and powerful explosives, shall be punished with a fine of not less than $1,000 nor more than $10,000, one-half for the use of the informer. The Attorneys and Marshals are instructed to be diligent in their efforts to prevent the offences described, and to detect and prosecute those who may commit them. The circular is an outgrowth of the dynamite discussion in England.

The terms of the Mexican treaty, recently ratified by the Senate, require certain legislation by Congress to give it effect. This will bring the whole question before the House of Representatives.

The House Committee on Foreign Affairs on Thursday considered the action of Prince Bismarck upon the Lasker resolution. Mr. Phelps (Rep., N. J.) proposed that a report should be submitted to the House, declaring in effect that the wise course of the Secretary of State relieved the House from the necessity of any further action. Mr. Eaton (Dem., Conn.) said that the action of Bismarck was an insult, and should be resented in terms which would leave no doubt of its emphatic disapproval. The further consideration of the subject was referred to a sub-committee consisting of Messrs. Curtin, Eaton, Phelps, and Rice.

The House Committee on Foreign Affairs on Monday unanimously agreed to a resolution in the Lasker matter. It in substance renews the expression of regret at the death of a distinguished member of the German Parliament on American soil, and states that the House has no concern in the relations between the German Executive and the Reichstag.

The House of Representatives on Wednesday defeated the item of the Postal Appropriation Bill making $4,000 the largest salary of any Postmaster.

Mr. Hewitt introduced in the House on Monday, and had read, the bill recommended by the New York Chamber of Commerce to suspend the coinage of silver dollars for two years, and to forbid the issue of one and two-dollar notes.

The Senate passed the Fitz-John Porter Bill on Thursday by a vote of thirty-six to twenty-five; Messrs. Hoar, Jones, Pike, Sabin, and Sewell of the Republicans voting yea. As it omits the clause giving Porter "all the rights, titles, and privileges" held by him when dismissed, and more specifically cutting off any back pay, it will have to go back to the House for concurrence.

The Senate on Monday passed a resolution appropriating $50,000 for the stamping out of the foot-and-mouth disease among cattle. On Tuesday Senator Hawley introduced a bill authorizing the Secretary of the Navy to offer a reward of $25,000 for rescuing or ascertaining the fate of the Greely Arctic Expedition.

The bill to aid in the establishment and temporary support of common schools was taken up in the Senate on Tuesday. It appropriates for the first year $15,000,000; the second, $14,000,000; the third, $13,000,000; and so on for ten years, decreasing $1,000,000 yearly, to be expended for common-school education, the distribution to each State being made on the basis of illiteracy; the money to be paid by the United States in the first instance to the Treasurers of the respective States, or such other agents as the States may designate, and the Secretary of the Interior to have charge of the portion going to the Territories. Senator Blair, of New Hampshire, made a speech in its favor.

Henry Watterson appeared before the Joint Committee on the Library on Friday, and made an argument in support of the Newspaper Copyright Bill. He explained that the present bill granting a copyright for eight hours was all that was sought by the promoters of the measure. Its object was simply to prevent the pirating of news and concurrent publication. He said that it did not act as a bar to the reproduction by afternoon newspapers of matter which had appeared in the morning papers, and could not, in the remotest degree, affect what is known as the "country press."

The United States Supreme Court rendered a decision on Monday of much interest to Northern capitalists who had money in the hands of Southern agents at the outbreak of the rebellion. The suit was brought by Northern parties to recover of a Southern agent who had their funds. His defence was that he was compelled to pay the money to the Confederate Government under the Confiscation Act. The Supreme Court holds that the Confederacy has no legal status; that its acts are no defence; that the Southern trustee was a part of the Confederacy, and cannot plead such a defence, and, therefore, that the Northern creditor can recover.

Governor Cleveland signed on Monday the bill taking from the Aldermen of this city the power to confirm the Mayor's nominations. He filed with it a long memorandum giving his reasons for approving the measure. In this he says: "It will hardly do to say that, because the Aldermen are elected annually and the Mayor every two years, the former are nearer the people and more especially their representatives. The difference in their terms is not sufficient to make a distinction in their direct relations to the citizens. The intelligence and watchfulness of the citizens of New York should certainly furnish a safe guarantee that the duties and powers devolved by this legislation upon their chosen representative will be well and wisely bestowed; and, if they err or are betrayed, their remedy is close at hand."

Mr. Clinton's bill to extend the State Civil-Service Act to all cities was called for third reading in the Assembly on Thursday. After being amended on motion of General Curtis in the way of improvement, the vote was taken without debate and the bill was lost, 55 ayes to 50 nays (not a majority of the whole Assembly). Thirty six Democrats and fourteen Republicans voted against it.

Mr. Roosevelt, Chairman of the Assembly Special Committee which has investigated the various departments of the local government of New York city, presented in the Assembly on Friday the results of the Committee's investigations in a voluminous report. The details of it cannot be presented in a brief paragraph. In Mr. Roosevelt's oral summary of the report he said: "We found a large number of abuses due not to bad laws but to a violation or evasion of good ones, and these abuses we have brought to the notice of the proper prosecuting authorities of the county and State—the Corporation Counsel, District Attorney, and Attorney-General. As far as we went, we certainly found the government of the city of New York to be in a condition that was simply appalling, and that would not be allowed to exist for one moment if the majority of the voters of that city were alive to the dangers that threaten them, and were influenced by the slightest particle of public spirit."

Nine bills were reported by Mr. Roosevelt's Committee to remedy the abuses uncovered by the investigation. The general character of these was referred to last week. Mr. Roosevelt failed to obtain the necessary votes to make the bills a special order for certain days.

Assemblyman Roosevelt called on Governor Cleveland on Tuesday, and formally asked for the removal from office of Alexander V. Davidson, Sheriff of New York city. Mr. Roosevelt reviewed the evidence taken before the Committee relative to the abuses in the Sheriff's office.

The Assembly, on Monday evening, by a vote of 71 to 20, passed the bill extending the commission hours of the elevated railroads of this city so as to make them from 4 to 10 A. M. and from 3 to 9 P. M.

The annual dinner of the New York Free-Trade Club took place in this city at Delmonico's on Saturday evening, more than two hundred gentlemen being present. The event of the evening was the speech of Speaker Carlisle, whose masterful review of the evils to which protection had subjected the country was frequently interrupted by applause. The other speakers were Senator Vance, who spoke on the financial slavery of the present day; Hilary A. Herbert, David A. Wells, George H. Putnam, Professor W. G. Sumner, Capt. John Codman, Perry Belmont, and James Parker.

The sugar-planters of Louisiana held a convention in New Orleans on Wednesday, and passed resolutions declaring that "the time has come when the sugar-planters and manufacturers and rice-growers of Louisiana should demand that cane-sugar and rice be included among the products of American industry which are entitled to adequate and permanent protection."

The Meigs Elevated Railroad Bill has passed the Massachusetts Legislature. It nominally permits the construction, under certain restrictions, of elevated railroads under the Meigs system through any of the towns or cities of the Commonwealth, subject to the approval of Selectmen or Aldermen.

It is reported that a number of Fenian Leagues have been formed in Dakota to aid in furthering the secession movement in Manitoba.

The great levee on the Mississippi at Morganza, La., broke on Friday night, damaging property valued at several million dollars.

A terrible explosion, supposed to have been caused by fire damp, occurred at the coal mines near Pocahontas, Va., on Thursday morning, about 12:30 o'clock. One hundred and fifty miners, Hungarians and negroes, were in the mine at the time, and all were killed. The work of destruction was not confined entirely to the interior of the mines, but houses two or three hundred feet removed from the mines were overturned, and in several instances entirely demolished. The large ventilator of the Southwest Improvement Company was blown to atoms.

Hamilton College seniors have returned to their work, on the Faculty's terms.

Prentice Tiller, the Pacific Express Company's money clerk at St. Louis, who decamped with nearly $100,000 a few weeks ago, was arrested on Thursday in Milwaukee, and $90,000 of the stolen money recovered.

FOREIGN.

Prince Bismarck appeared in the German Reichstag on Thursday and made a speech in justification of the course he had pursued in refusing to transmit the Lasker resolution to the Reichstag. He said that he had recognized the good intentions of the American Congress, but he was unable to harness himself to the

car of the Opposition. He would have refrained from alluding to the matter except for the manner in which the Reichstag had discussed it. He continued: "Herr Lasker belonged to an Opposition group who made immense capital out of Herr Lasker's merits." At this point the Left interrupted with loud cries of "Shame." He turned indignantly toward the quarter from which the cries came, and, advancing toward the Left, shouted: "The cry of 'shame' is an insult to me, and demands for me the protection of the President." He said that Herr Lasker introduced himself in America as the champion of German freedom against the despotic tendencies of the Chancellor. "Am I to make myself my enemy's postman?" asked Bismarck. "Even on the assumption that Americans are not intimately acquainted with our circumstances, the American Minister at Berlin, or some other official who possessed sufficient knowledge, might have sent a confidential warning against conferring on me the part of postman. This was not done. Therefore, I instructed Herr Eisendecher, the German Minister at Washington, that I could not possibly forward the resolution." Dr. Haenel, Progressist, replied that the friendly sentiments of the resolution should have been recognized without too carefully weighing the words in which they were expressed. The appearance of Prince Bismarck in the Reichstag is generally attributed to his desire to maintain friendship with America.

Mr. Sargent, the United States Minister to Germany, has accepted from Prince Bismarck an invitation to a dinner to be given on March 22, in honor of the eighty-seventh anniversary of the birthday of Emperor William.

It was rumored in London on Sunday that the British Government, desiring to test the opinion of the country in regard to the Egyptian policy, and fearing that obstruction in the present Parliament would thwart the Franchise Bill, had decided to dissolve Parliament, and had informed the Queen of this decision through Mr. Chamberlain, who dined at Windsor Castle on Saturday evening. The London *Daily News* on Monday predicted an early resignation of the Cabinet, and asserted that the existence of the Government and of Parliament was precarious and in hourly jeopardy.

Mr. Gladstone was suffering from laryngeal catarrh on Sunday and Monday, and was unable to take an active part in the crisis. On Tuesday morning he was better, but absolute rest was enjoined. In the evening he was worse, and it is probable he will go to the South of France for a rest.

General Graham's British forces defeated the rebels under Osman Digna, in a hard-fought battle near Suakim on Thursday. The rebels opened fire about one o'clock in the morning. It was bright moonlight. The British troops were ordered to lie down. All night the Arabs kept up a fusillade which was annoying. They directed their fire especially toward the hospital wagons. At six o'clock, sunrise, a Gardiner gun and a nine-pounder were turned against the rebels, who were within 1,300 yards of the British position and afforded a most excellent target. The Arabs were soon compelled to retire to their main position near the Tamia Wells. The British forces advanced in two brigades, which were thrown into the form of squares. A series of encounters followed. Soon after leaving Sariba, the great body of the rebels charged the leading squares, spearing many of the British. The sailors, who were inside the square, immediately closed up, and the rebels were repulsed with great slaughter. The advance was then resumed, when immense hordes rushed upon the British from both sides. The Arabs fought with great pluck and bravado, and were nearly all killed. The second brigade met with obstinate resistance and was at one time repulsed. The rebels, under cover of the smoke, crept close up to the British lines and dashed against the marines and the Sixty-fifth and Black Watch Regiments, throwing themselves upon the bayonets of the British. The Sixty-fifth began to retreat, crowding upon the marines, when all became inextricably mixed. The guns fell into the hands of the rebels. General Graham and his staff did their utmost to rally the men, retreating 800 yards to enable them to reform. Assistance from the other brigade prevented a serious disaster. The enemy fought more stubbornly than at Teb. Ninety-one British were killed and 103 wounded. The rebel loss is estimated at 2,000 killed and several thousand wounded. About 12,000 took part in the fight. The camp of the rebels was in General Graham's hands before noon, and a victory was assured. The Hussars made a forward movement and cut off the rebels' retreat to Sinkat. The Arabs retired before the English slowly and sullenly. They were defeated, but not put to rout.

A panic occurred on Friday night among the Egyptian troops under Baker Pasha, who were still in camp at Sariba. They got the notion that the rebels were approaching, became frightened, and took to their heels. Before the panic was allayed two men that were taken for rebels were killed. The troops returning to Suakim on Saturday cheered greatly the personal heroism of Adams Fraser, the largest man of the Black Watch Regiment. Twelve Arabs were despatched by his single bayonet.

General Graham was ordered on Monday not to push his reconnoissance far beyond Handuk. It is not true, as has been reported, that Turkish troops are going to Suakim, or that the British Government has decided to send an expedition to Sinkat and Berber.

Osman Digna, with 2,000 followers, was reported on Tuesday in the neighborhood of his old camp. He adopts the same tone in his intercourse with his people as before the last disaster, and is exhorting them to a religious war. He assures them that in the third battle success will be theirs. But the tribes are much demoralized as they reflect upon the full significance of their crushing defeat.

A conference held in Suakim on Sunday between Admiral Hewett, General Graham, and the chief inhabitants of Suakim, resulted in the issue of a proclamation offering a reward of £1,000 for the capture of Osman Digna. The Admiral explained on Tuesday that he considered Osman Digna a murderer because he had killed two of his messengers. Therefore he had offered the reward for his head. The British Government ordered him to withdraw it in the most judicious manner possible

The Haggis tribe have given their adherence to General Gordon, thus stemming the advance of the Sheikh El Obeid to the Nile. General Gordon has built a strong fortified camp on the opposite side of the Blue Nile, and has stationed a strong force there to prevent the advance of El Obeid.

There were indications on Saturday of increasing activity on the part of the rebels near the Nile. Beyond Berber, telegraphic communication was cut off, and a steamer descending the Nile from that city was fired upon by the insurgents.

Much anxiety is felt in regard to the situation at Khartum. The correspondent of the London *Times* at Alexandria says: "It is proverbial that three courses are possible: to leave General Gordon to his fate; to despatch English troops to Khartum; or to import Indian troops. The policy of doing nothing has not hitherto achieved signal success."

The police of Newcastle-on-Tyne have received information of a plot to explode the principal buildings of the city, including the Central Railway station and the Post-office.

The Irish justices, in opening the Assizes, agree that there has been a gratifying diminution of crime in Ireland.

Henry George has abandoned his lecturing tour in Great Britain on account of ill health, and has gone to the Continent to recuperate.

Richard Hengist Horne, the English poet, essayist, and critic, is dead. Mr. Horne was born early in the present century. He was educated for the army at the Royal Military College, Sandhurst, but entered the Mexican navy as midshipman. He served until the close of the war between Mexico and Spain. After that he came to the United States, where he visited the Huron, Oneida, Mohawk, and other Indian tribes. On returning to England he devoted himself to a literary life, producing several tragedies and the epic 'Orion,' which has reached ten editions. He has been a constant contributor to periodical literature.

M. Waddington, French Ambassador at London, telegraphed on Saturday to Prime Minister Ferry that the Marquis Tseng, the Chinese Ambassador, had asked Earl Granville, the English Foreign Secretary, to mediate between China and France.

On Sunday it was announced in Paris that the French advance from Bacninh had begun. Gen. Delisle marched upon Thainguyen, and Gen. Négrier upon Langson. The French Government instructed Gen. Millot not to carry operations beyond Thainguyen and Langson. Prime Minister Ferry has reopened direct negotiations with Marquis Tseng for a treaty with China, France to retain Bacninh.

General Négrier's column entered the city at 6 o'clock on Wednesday evening. The French had seventy wounded, and the Chinese loss was heavy. General Négrier encountered the enemy at Xairoy. A severe battle ensued. The enemy were at last forced to retreat, and the French forces pursued them into Bacninh by the Langson road. The enemy evacuated the town in great disorder, and the French continued to pursue them in the direction of Thainguyen.

Advices from Bacninh on Monday reported that the French forces, while pursuing the Chinese near Phulanggian, crossed the river and captured the Phulang fort.

It was reported in Paris on Tuesday that Li Hung Chang, Viceroy of China, was submitting a basis of peace to the English and American Ministers at Pekin and asking them to intervene.

Haiphong despatches report that pirates had captured a small merchant steamer near that town, and had murdered the French captain and eleven of the crew.

Prime Minister Ferry, of France, has been interviewed on the question of a general disarmament by the European Powers. He pronounces it an impossibility, and says the discussion of it is a waste of time.

A manifesto from Prince Napoleon (Plon-Plon) is regarded in Paris as imminent. He has left Paris for Switzerland to avoid arrest, taking with him his papers and valuables.

General Velarde, a cavalry ensign, three sergeants, and two civilians were arrested a General Velarde's house in Madrid on Saturday. A number of other arrests were made. The Spanish Government has been aware for some time that there was a conspiracy for a military uprising similar to that which took place last August; and hence the arrests. Part of the conspiracy was to seize the palace some time when the ministers were assembled and King Alfonso was presiding. Zorilla is believed to have had a hand in the affair.

Signor Quintino Sella, the Italian mathematician and financier, is dead. He was at one time Secretary of the Italian Treasury. His works on mineralogy and mathematics are standards in Italy.

The Italian Chamber of Deputies has accepted the resignation of its President, Farini. The election of his successor on the 20th will probably be made a Cabinet question.

A NEW VIEW OF THE CONSTITUTION.

JUDGE FIELD'S dissenting opinion in the legal-tender case declares that the Court has adopted a rule of construction which, if followed in other cases, would change the whole nature of the Government. A brief examination of the opinion of Judge Gray on the other side is sufficient to show exactly what this means. The Constitution gives Congress the power to "borrow money on the credit of the United States," and "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers." Now, says Judge Gray, the settled rule of construction is that the words "necessary and proper" include "all appropriate means which are conducive or adapted to the end to be accomplished, and which in the judgment of Congress will most advantageously effect it." The Judges maintain that among the means adapted to the end of borrowing money in the case of a Government is that of making its notes a legal tender for the payment of private debts; that Congress has decided this to be the case, and consequently it has the power. At first sight this argument seems to involve the right of making a legal-tender currency wherever the right to borrow money exists. Every man in the United States has the right to "borrow money" if he can get any one to lend it to him, but he cannot therefore make his notes and I. O. U.s legal tender. Why not? What is the difference between the two cases? The Court bridges over the difficulty by saying that a government's power to borrow money is different from that of an individual's, and that a "sovereign" has always had the power to make its notes current from hand to hand in this way.

The Court really need not have taken the trouble to invent this curious species of argument; for the Judges had before them a clause of the Constitution which would have required no such stretching to make it meet the case. Among the enumerated powers given to Congress is the following: "The Congress shall have power to levy and collect taxes, duties, imports, and excises, to pay the debts and provide for the common defence and general welfare of the United States." Now, the Court says, this clause "either embodies a grant of power to pay the debts of the United States, or presupposes and assumes that power as inherent in the United States as a sovereign government." In the same way the clause obviously either embodies a grant of power to "provide for the common defence and general welfare of the United States," or presupposes and assumes that power as inherent in the United States as a sovereign Government. Not only may Congress provide for the general welfare, but it may pass all laws which are conducive or adapted to the end to be accomplished, and which in the judgment of Congress will most advantageously effect it.

This is not the argument of a narrow-minded Democratic lawyer, nor our own. It is that of the Supreme Court of the United States, and it gives a good deal of point to the following suggestion of Judge Field:

"The argument presented by the advocates of legal tender is, in substance, this: The object of borrowing is to raise funds, the addition of the quality of legal tender to the notes of the Government will induce parties to take them, and funds will thereby be more readily loaned. But the same thing may be said of the addition of any other quality which would give to the holder of the notes some advantage over the property of others, as, for instance, that the notes should serve as a pass on the public conveyances of the country, or as a ticket to places of amusement, or should exempt his property from State and municipal taxation, or entitle him to the free use of the telegraph lines, or to a percentage from the revenues of private corporations. The same consequence, a ready acceptance of the notes, would follow, and yet no one would pretend that the addition of privileges of this kind, with respect to the property of others over which the borrower has no control, would be in any sense an appropriate measure to the execution of the power to borrow."

"The power to provide for the general welfare" is quite enough. Under this and the power to pass necessary and appropriate laws, surely Congress may do whatever is needful with the currency or with commerce; and why it should be thought necessary to resort to an elaborate argument founded on the power to borrow money, we do not see.

The rule of construction adopted by the Court enables Congress to do what it pleases; makes it the judge of what is appropriate to the exercise of the implied powers of the Constitution, and makes the only limit of these the general doctrine of "sovereignty," which is either one of arbitrary power, or at the best the authority enjoyed by the English Parliament. When we talk of our Government being one of limited powers, we mean powers limited by the Constitution and defined by the courts. If the limits are to be imposed and the definitions framed by Congress, the use of the Supreme Court for keeping one branch of the Government from encroaching upon another or upon private rights is pretty nearly gone. Practically, there seems no way of avoiding this consequence of the legal-tender decision except through a new amendment, and we have got to pass such an amendment, or else adopt a view of the Constitution and Government wholly different from any hitherto held either by strict or free constructionists.

CATCHING THE DYNAMITERS.

WE have more than once, in answer to the demands of the English press on the United States Government in the matter of preventing the hatching of dynamitic plots in this country, called attention to the fact that in the English Custom-house and Coast-guard service there exists the most effective agency that could be devised—far more effective than anything we could possibly create—for preventing the introduction of explosives into England from abroad. Indeed, if the English Custom-house cannot stop the infernal machines, it is folly to ask any foreign police to do it. The other day, however, a valise containing a large quantity of dynamite was found at the Paddington Railroad station in London. Here is the description of it, taken from the London *Times*, which assumes it to be of American origin:

"The portmanteau, which had been deposited on Monday night, was well made of brown leather, and studded with brass knobs on the bottom and sides, to prevent the leather from coming into contact with the ground. It was eighteen inches long, eight inches deep, and about four inches across. It was fastened in the centre with a lock, having a flap to prevent wet from entering, and it had buckles and straps on each side and on the top. On being opened it was found to contain forty-six cakes of the 'Atlas Powder,' some in a cash box, and others packed around it. In this case, however, the label 'Atlas Powder' had been torn off nearly all the packets. The arrangement of the clock and the pistol here was exactly as in the Charing Cross bag. The clockwork had been set; but the workmanship or material of the spring had proved to be inferior, and the alarum had run down—the bell, of course, being off—without 'pulling off' the trigger of the pistol."

A very disagreeable article certainly, and too large to be concealed. The *Times* is apparently unconscious, however, of the bearing of the following remarks on its outcry against the American Government:

"There is one point in these discoveries which has caused astonishment, even in official circles, and that is how large quantities of this dangerous explosive could have passed through the Custom-house of this country. Travellers from the Continent know that their luggage is often rigorously searched on their arrival. But here it is plain that at least 90 lb. of an explosive compound of the most dangerous character has been allowed to slip through the fingers of the Custom-house officers, and this, too, from what may be called the land of tobacco."

Now, we cannot here set up machinery for searching the baggage of everybody who leaves the United States. But in England the baggage of everybody who enters the country is already searchable, and there are officers whose business it is to search it. They have long been full of suspicion about American travellers, and yet here is a bulky infernal machine passing from "the land of tobacco" through their very hands or under their very noses.

There could hardly be a better exposure than this one little incident furnishes of the rant of the following, which we find in an editorial article in the same paper on the same day:

"We know, and the Americans know, the busy brains which have plotted these outrages, the defiant tongues which have threatened them, and the nationality of their actual perpetrators. It would be no hard task for the American Government to put an end to the whole thing. We have done our part. We have frustrated the attempt which has been again and again made to carry through the conspiracy in this country. We have made the private manufacture of explosives penal, and their possession a thing for which the owner can be called to account. The result has been that the conspirators have changed their ground, and that they have found in America a safe refuge, and a Government which does not meddle with them. This is a state of things to which it is not possible that we should submit. It would be bad enough if America were a hostile country. A dynamite war does not come within the limit of permissible hostilities. Its agents are common enemies, whose presence no civilized community can tolerate without disgrace. The miscreants to whose hand we owe the late threefold attack on life and property have done only what American journals have been suffered to advocate, what rewards have been openly promised for, and what public meetings have been held to for-

ward or to applaud. It is time indeed that a strongly-worded remonstrance should be addressed to the Government of a country which connives at all this. We know that respectable Americans feel as we do in this matter, and that they are ashamed of the inaction of their rulers."

The assurance of the assertion that it would be "no hard task for the American Government to put an end to the whole thing," and that "we [England] have done our part," and that the American Government "connives" at the dynamite attacks on life and property, is, under the circumstances, simply amazing. What are we to say to a Government which allows such things as portmanteaux containing ninety pounds of dynamite and arranged with clockwork for explosion, to pass through its Custom-houses and be deposited in its leading railroad stations, and occasionally exploded, with great loss of life and damage to property, in the teeth of numerous warnings, from the very manufacturers of these instruments, uttered openly through the public press? If the English police and Custom-house can do no better than this now, how would it be if we silenced O'Donovan Rossa and the *Irish World*?

The Attorney-General's circular on the subject of dynamite shipments ought to convince the English Government that the Administration is ready to do anything in reason to put a stop to dynamite outrages. It appears to have been drawn up in consequence of representations or requests made from England. The cases in which one country will undertake to make special efforts to enforce its laws, and charge itself with a responsibility for their enforcement, on account of indirect danger arising from their breach to life and property abroad, must in the nature of things be very rare; but the Attorney-General, according to his own account, is going further than this, for he calls upon the District-Attorneys and Marshals to enforce the laws against shipment of explosives, upon a "report" that certain persons unnamed are "aiding in the prosecution of heinous crimes, by shipping to foreign ports explosives dangerous in the highest degree to life and property," and although "no proof has been adduced that this rumor has been founded upon fact."

The laws against the shipment of explosives were passed in 1866, long before the present dynamite war was dreamt of, and were designed for a very different purpose from that of preventing dynamite outrages, viz., the safety of travellers by land and water, and the protection of steamship and railroad companies. They made it illegal (U. S. R. S. sections 4278, 4279, 5353, 5354, 5355), first, to transport by land or water anything like dynamite on any *passenger* vessel or vehicle, between the States, or between places in the United States and any foreign country; second, to transport it by any means of conveyance unless it is packed in a metallic vessel, surrounded by some substance which will be non-explosive if "saturated" with the contents, and conspicuously marked "Nitro-glycerine, dangerous." Violations of these regulations are punishable by fine; and a death caused by violation of the act is made manslaughter, punishable with imprisonment for not less than two years.

These laws were not passed to prevent dynamite outrages, and it is difficult to see how the closest attention to their enforcement would prevent such outrages. The dynamite which is used for this purpose is not usually shipped from the place of manufacture to Liverpool by bill of lading, and there called for by the consignee. It is generally, and might, of course, always be made or purchased in secret, and carried about by hand, and caused to explode by means of machinery procured from a perfectly innocent clock vender. The statutes do not authorize the search of persons for dynamite going on board ocean steamships, the idea that the fancy would come upon people to carry dynamite about in satchels not having occurred to Congress in 1866. If the law of 1866 had really been intended to break up dynamite conspiracies, it would have authorized the searching of all travellers and the seizure of all explosives found upon them. Of course such a law is out of the question in a free country like England or America, and would probably fail even in Russia.

The importance of the circular lies almost altogether in the evidence it gives of our sincere desire to put into execution all the power of the law against the dynamiters. It is an act of good-will that we could hardly have volunteered; indeed, had we done so, it would probably have laid us open to a charge of insincerity for undertaking to prevent dynamite outrages by means of laws which were designed for a different purpose, and very poorly adapted to any such end. But if England herself asks us to enforce such laws as a means of stopping the dynamiters, no harm can certainly come of it, and possibly some good. It is an act of extreme international good-will; first, because we have no proof that life and property in England are in any way endangered by a non-enforcement of these laws, nor even that these laws are not enforced; second, because they were passed for an entirely different object, not growing out of any international duty whatever. No country recognizes the right of another to demand that it should make special efforts to enforce its laws, without first proving that it has a strong interest in their enforcement, and, second, that they are not enforced. In this dynamite business it is well for us to proceed very cautiously, for everything that we do will be cited hereafter as a precedent, and there is no field of international activity in which it is more important to be cautious than that of recognizing the right of foreign governments to inquire into the enforcement of our domestic laws. As other requests may very likely follow, it is important to bear in mind that the right of England to *require* us to enforce our laws must, when it exists at all, grow out of some generally recognized international duty.

CLASSICAL SCULPTURE IN THE MUSEUMS OF EUROPE.

THE different museums of sculpture present no uniform practice with regard to repairs of their works of art. Even if their present managers should be practically of one mind as to this question, they are the inheritors of a long series of administrators most diversely minded. The more important of the recent acquisitions of Europe in the way of classic sculpture are put on exhibition without any restoration or piecing out whatever; as, for instance, the astounding Pergamon reliefs at Berlin, where not even shattered faces are in any way repaired; or as in Rome, where the newly found marbles housed in the Conservator's Palace on the Capitol are left armless or headless if found so; or as in Athens, where new discoveries are not uncommon, and where no repairs are made. This is the modern practice—not that it is of very recent origin, for it dates back three-score years and ten; but unfortunately, it has only of late become general. The "Elgin marbles" have been let alone: no one has ever pieced out the "Theseus" with hands and feet, or tried to fit a head on the "Ilissus"; and yet they have been on exhibition in the British Museum for two generations of men. The Venus of Milo, although her pose is not unquestioned—both the placing of the base upon the pedestal, and the adjustment of the upper block forming the body to the lower one, being matters of dispute—has never been disguised by modern arms; and this statue has been in the Louvre for more than a half-century. Even in the Vatican, not the place to look for such wise restraint, the splendid draped statue in the long gallery (Museo Chiaramonti), generally known as a Niobide, remains headless and armless, although it was for nobody knows how long in private hands, and then in the Quirinal Garden. The Torso of the Belvedere and the so-called "Genius" in the Gallery of Statues will occur to every one who knows the Museum as being unrestored, although the one for three centuries and the other for a century have belonged to the Papal Museum. On the other hand, the practice in the Munich Glyptothek has always been complete restoration: arms, heads, helmets, feet, hands, and weapons are supplied to all comers to this museum, although it dates from within this nineteenth century, and the Ægina sculptures were not renovated until after Lord Elgin's plunder had been brought to England and purchased by the nation. With less thoroughness, this has been done almost everywhere. A very brief inspection of the Louvre is enough to decide for us what the fashion is there. With few exceptions, as above noted, the Vatican sculptures are always made complete, besides being cleaned in a way to make one uneasy and suspicious; for the traditions of that great Museum are neatness and elegance, with not too great observance of archæological purity.

If all the famous ancient statues of Europe should be, by common consent of their curators, stripped this winter of their non-original parts, next summer's flight of tourists would be stupefied at the appearance of some of their pet admirations. The Laocoon would be found without the father's right arm, which is thrusting away from him a great fold of the serpent, as if it were the bight of a hawser, and with no more life in it than such a hempen loop as that; and the two sons would lack, the one his right arm, the other his right hand and wrist. The Discobolus in the Vatican would have no head; and the modern athlete, accustomed to fix his eye on the mark when he aims his quoit or ten-pin ball, would certainly not be the man to restore the statue with a head placed like the duplicate statue in the British Museum; nor yet to follow the other duplicate in the Palazzo Massimi, with head screwed around to look after the discus; nor yet to retain the present head, with eyes turned on the ground near the feet of the quoit-thrower. The Biga, or two-horse chariot, in the same hall, would have neither horses nor wheels, and might almost be taken for that which it was made to serve for once—an arm-chair. The Medici Venus would

retain the stump of one arm, but almost no trace of the other; and assuredly the Tribune would seem less attractive to some travellers when its chief attraction to the Murray-guided tourist should be so changed from what Lord Byron saw and worshipped. Many hundred "Amazons," and "Cereses," and "Nymphs"; many hundred "Mercuries" and "Boxers" in all the great cities of Europe, would be divested of their distinguishing attributes, and would be reduced to their essential nature of good or excellent classic sculpture, not easy to give proper names to, but none the worse for that. Many hundred heads, arms, legs would be detached and left on hand, of which a very few, known to be ancient, though not hitherto in their right places on the bodies originally belonging to them, would still find places in the galleries; while the rest might be given to drawing-schools for models, for most of them are fairly good in anatomy.

The future is with the archæologists; and a public opinion among those interested is developing itself, too strong for the lovers of neat and complete, though inauthentic, sculpture. For years past no restorations more extensive than feet and fingers have been undertaken, and such as they will soon become impossible. And evidently this state of things is to be worked for and hoped for. For, in very truth, no man has any right to thrust himself in between the student and his original. Let us suppose, for instance, that the "Venus of Milo" had been restored, forty years ago, as a Victory, on the model of the noble bronze statue at Brescia. There would have been something to say for that design—a certain resemblance between the statues is not the least argument in its favor. But the strong convictions of those who see in the statue a part of a group would then have been disregarded, and not justifiably; for, although when action is necessary the responsible actor must know how to disregard the reasons which make against his adopted course of action, in such a case as this no time can be set when action becomes necessary. Students were not agreed, forty years ago, as to the statue's original arms; they are not agreed now; they never will be agreed—unless the original arms should be found, rescued from that Turkish ship in which they sailed away from Melos. Now, in this case, as every one is accustomed to see the statue, or representations of it, armless, few persons will object to its being left so. Probably any attempted restoration of the original would offend even the advocates of that theory which might be followed in making it. But consider the other famous Venus, the heroine of Byron's verse, the adored of so many generations of tourists—the Medici Venus at Florence. This statue is, no doubt, a work of inferior value; the writer of this can heartily agree with that shrewd Scotch sculptor in Florence, who says that when his ideal students' collection of first-hand casts of a hundred or two hundred masterpieces shall be made, the statue in question shall not be included. But still there is merit in it. The long row of marble ladies standing in the same attitude on the stylobate at Naples are none of them so good, although it was perhaps from them, or from some of them, that Bernini took the position of the arms and hands when he added them to the Florence beauty. The Venus of the Capitol, alone among the statues which are known to be in the same attitude, is the equal, or rather the superior, of the Florence marble; and this work, unique in sculpturesque treatment, is almost alone in its perfect preservation. The Medici Venus, then, is neither the better nor the worse for all the uproar of three centuries, and is still worthy of a place where it can be properly seen, in spite of the scraping and polishing the marble has undergone. Obviously, then, the arms should be removed, and this our children will see done. A cast, or a good copy, will preserve for them the memory of their fathers' idol.

This is an instance of a fairly judicious restoration. But it is easy to name vile ones—inexcusable blunders, or, more often, reckless puttings-together; hasty attempts to avoid the supposed impropriety of leaving broken sculptures broken. Consider the valuable archaic female statue at Venice, with heavy plaited drapery, in the attitude, as if walking, so characteristic of very early Greek statues. Upon this headless statue some restorer has mounted a pert nymph's head of late style, with hair elaborately dressed in a lofty top-knot. Or, as an instance of a more important work of art spoiled in the same way, take the group at Naples, the Harmodius and Aristogeiton—fine work of an early epoch. The striking warrior has his own head, with short-curled, knotted hair; but his friend who accompanies him, ready to parry and to ward, has received the addition of a head of much later time, good in itself, but of absurd appearance where it is—not merely its treatment being out of keeping, but its very pose and the action of the muscles of the neck contradicting the movement and purpose of the man. Or, what is to be said of the Farnese Bull of the same museum, "the largest piece of ancient sculpture in Italy," of which, as the principal figures are two young men, two women, and the bull, there are of modern work the head of the bull, the whole of one woman, the upper half of the other, and more than half of the two young men?—a restoration nearly as thorough-going as the above-mentioned Biga. A colossal marble bull without a head, and some traces and indications of human figures around him, is what the Museum should show as its original work found in the Baths of Caracalla, or elsewhere. A cast of the present group (which is a Renaissance design of spirit enough), and as many alternative restorations as room may be found for, or as sculptors of merit may propose, may be set up near it for comparison.

Some persons like the Barberini Faun better than perhaps the merit of that statue would justify. At all events, they should study the figure without the modern legs, for the whole of one leg, and of the other all, except some bits of the ancient marble inserted, are of yesterday. Take away, besides these, the half of one arm, a part of the other, the nose, together with part of the lion skin and supporting rock, and we have left a fine torso with only slightly injured head, just as it was hurled from the high platform of Hadrian's mausoleum on some day of siege and storm—a more respectable work of art, by far, than Kronprinz Ludwig's purchase, patched up now for the third time, and with no more certainty than at first of being rightly restored. But of all restorations, reparations, and transmogrifications, that inflicted upon the "Cnidian Venus" of the Vatican is the most grotesque. This may be to others, as to the writer, the loveliest statue of very young, of budding womanhood in Europe. It stands in a niche on the left as one enters the "Hall of the Greek Cross" from the great stairs, and, therefore, can be looked at from one point of view only. The workmanship is Greek, the marble is Greek, the vase, over which her drapery is thrown, is Greek; and all the ancient work is just as near perfection as human handiwork, even in Greek sculpture, commonly reaches. But, from the hips down, the statue is hidden, wrapped up, "mummy-fashion," as Braun says in his guide-book, with metal-like drapery; and the right forearm and hand are restored in such fashion that the hand holds up this mass of clothing. What makes it the more inartistic is that the drapery thrown over the vase is complete in itself, so that two nearly equal masses of stuff are held up side by side. What makes it the more unlearned, the more unarchæological is, that the statue is named the Cnidian Venus, *nemine contradicente*, on account of its resemblance to the medals which preserve for us some recollection of Praxiteles's famous work, and that that figure is undraped. When Italy comes to her own, we shall see this inestimable statue set upon a revolving pedestal, like her sister in the Capitol Museum—or, at least, put up in the middle of a room as the Belvedere Torso is—and that without her stucco costume.

It should be remembered that the presence of clever and probable restorations, however acknowledged and however visible, is apt to mislead even the somewhat careful student. Writers who, like Mr. Symonds (to take a notable instance and a good one, for no such writer is more conscientious or more prudent), are accustomed to compare one art with another, or art with literature, in the search for light upon thought and upon human nature in classic times, are always in danger of reasoning from the completed statue or group, as if all parts of it were equally authentic. The ancient torso, with limbs and a nose of good modern work, accepted as a complete work of art by too many students during several generations, *has become* a complete work of art in the mind of the man who, at a distance and recalling his strong impressions, seeks to draw from them conclusions and beliefs which will be based upon not quite trustworthy material. Even professedly archæological writers are misled in that way. Our books of examples give us, as authentic ancient work, much-restored statues; and even one of the latest, Mr. Murray's 'Greek Sculpture before Phidias,' will be found to give an illustration of the Harmodius and Aristogeiton of Naples with the wrongly-adjusted head, described above, as if an original part of the statue to which it is attached. It will be said that a remedy for the mischief of restoration is found in giving an exact account of the restorations made. And this would be a good way if there were not a better—that is, the simple leaving them *not* made. Little by little the museums of Europe are coming into line, with more or less complete statements as to the mischief done. The Louvre has it in a little framed poster on each pedestal. The Capitol Museum, the Dresden Museum, and some others—alas! too few—have it clearly set forth in their catalogues. The Uffizzi catalogue has it, sometimes in the text, sometimes in a note, in such fashion that one is never sure whether to expect it when most needed. The catalogue of the Munich Glyptothek is the model one in this respect: every modern scrap is carefully indicated and described, and the judicious author has something to say by way of criticism of the more unfortunate instances of mistaken addition. But half the museums are without catalogues at present, leaving the student to imagine what fine ones his successors will have to guide them when their turn comes.

The Dresden Museum of Antiques in the Japanese Palace is not too admirable in the condition of its works of art; the German guide-books even agree as to the *ergänzt* condition of most of its sculptures. But its perhaps most valuable, certainly most curious possession, the archaic Athene, with the heavily embroidered border hanging down the front of her *peplos*, is unaltered. Two pedestals stand out in the room, well toward the windows; the one supports the original, a sadly-broken and defective statue, though what remains is in good condition,

neither defaced nor much discolored; the other holds up, for comparison with it, a restoration by Rauch—his conception of what the original must have been. This is what all must come to. No great museum can afford to go on much longer with its sham antiques, built up with a classical nucleus and a bewildering crowd of modern additions to confuse the student. The restored models will be based upon accurate casts of the original; as many different ones will be set up as seem worthy of consideration. Some museums will have them side by side with the original, for better comparison; others, with a sense of the higher dignity of the original, will relegate the studies of restoration to separate halls. And the catalogues will contain each modern sculptor's arguments for his own theory of what the original was when complete. But the marble itself shall have added to it neither nose nor finger, nor lip of vase, nor fold of drapery. If a limb is found broken off, and the edges fit perfectly, it may be attached, the catalogue calling attention to the repair. If a piece of a limb be found not capable of direct fitting into place, like the forearm and hand where the upper arm is lost, a metal bar may connect the member with the trunk at about its proper place. Where feet or legs (of a standing statue) are lost, the figure may be held at its proper height above the pedestal upon metal bars, or the pedestal may be shaped out, or may support a pilaster or block, to do the same office. But no completing of the statue or of any part of it will be allowed, whether in marble, or in plaster, wood, or papier-maché. R. Sturgis.

THE LASKER SENSATION.

Berlin, February 28.

The so called American "incident," viz., the return of the resolution of your House of Representatives, passed in honor of the late Mr. Lasker, by Prince Bismarck, has created general sensation all over Germany. On the whole, it is rather severely criticised by the independent press and political circles, which reject it as an unnecessary measure. The official papers, on the contrary, and the blind believers in the Chancellor, have done and are still doing everything in their power to obscure the real state of affairs, and, by raising side issues, to save at least appearances.

So far as the merits of the case are concerned, I agree with those who blame the Chancellor for having acted in so spiteful a way. What are the facts? The popular branch of the legislative body of a friendly nation, by an act of courtesy, send words of condolence to the family of a prominent political man, and to the parliamentary body in which he had won his distinction. They order it forwarded in the only possible way which diplomatic etiquette provides, and turn it over to the Secretary of State with the request to have it communicated "through the legitimate channels" to the presiding officer of the Reichstag. Mr. Frelinghuysen thereupon instructed the Berlin Minister to act accordingly. The latter had to deliver it through our Foreign Office, as he is excluded from direct intercourse with the other departments of the Empire. Thus Mr. Sargent was correct in every respect, and I am sure Bismarck would have accused the American Minister of a breach of etiquette if he had written directly to the President of the Reichstag. The Chancellor then goes on to say that he must solicit the authorization of the Emperor to communicate the resolution of the House to the President of the Reichstag. This is the first time that we hear of the existence of such a rule. When, a year ago, German-American citizens sent from the United States large sums of money to our Foreign Office, in aid of the sufferers by the inundations of the Rhine and Moselle, Bismarck did not hesitate for a moment to transmit them immediately to the Reichstag. I even presume he would also have delivered the resolution directly if the House had declared that in the death of Lasker they deplored the loss of one of the most faithful supporters of the Chancellor's policy; but it offended him that the deceased parliamentarian was praised for "his firm and constant exposition of and devotion to free and liberal ideas, which had materially advanced the social, political, and economic condition of our people." This opinion the Chancellor flatly contradicts, as not congruent with the development of the German people. He would, perhaps, not have done so if he had taken the trouble more fully to appreciate the meaning of the English words *free* and *liberal*, which signify more than party spirit is able to understand. History will judge more justly; but, however that may be, this difference of interpretation and feeling does not entitle the gentleman at the head of foreign affairs to withhold and return a document which was intrusted to him as the first public officer.

It is true, the wording of Bismarck's instructions to Mr. von Eisendecher is in its tone polite and friendly, but in its spirit it is small, pettifogging, and wholly unworthy of so prominent a statesman as the Chancellor. It is a melancholy fact that he gave vent to his personal feelings; but the opportunity of killing three birds with one stone was too tempting for him. His first victim was Mr. Sargent, your Berlin Minister. Bismarck dislikes him for his despatch in relation to the prohibition of imports of American pork. Since that time the former is no longer received at the Foreign Office, and has to carry on his diplomatic business in writing. The subordinates of that department, perceiving from what direction the wind blows, turn Mr. Sargent the cold shoulder, and his brother diplomatists, in order to please the Chancellor, also treat him coldly. Add to this the Minister's ignorance of all modern languages, except his mother tongue, and you will understand that he finds himself in a very unpleasant and isolated position. The purport of these annoyances is, of course, to worry him out of his place. Whether your Minister will resign, as it is hoped and expected, I, of course, do not know. Well-meaning papers, like the Cologne *Gazette*, advise him to apply to his Government for his recall and for another correspondingly high position; but they overlook the fact that your civil service is based on altogether different principles.

The second stroke was aimed at the late Mr. Lasker. The Chancellor is a sound hater, and he has proved himself so to none more than to this influential parliamentarian. Lasker's "doctrinairism"; his logical deduction, dictated more by legal than by political considerations; his cold reserve and stiff manners, never softened by hearty laughter or wit and humor, were always irritating if not offensive to the impetuous and aggressive character of Bismarck. It was antagonism between the jurist and the statesman. Up to 1879, when the latter returned to his old political friends and convictions, there existed a sort of political intercourse and even exchange of civilities between them. Lasker supported the Chancellor in all his great measures, but he reserved to himself the right of weighing them by his own standard, and of criticising them mercilessly. From 1866, however, to 1878, Bismarck had to submit to Lasker's often insupportable patronage, in order to keep him on his side, but he groaned impatiently under this restraint. I very well remember the time when the parliamentarian was flattered by the Chancellor, when the latter ostentatiously courted him at his receptions and provoked the envy of courtiers and diplomatists, who could not understand why Bismarck paid so much attention to the "little Jew" who had from 150 to 180 men behind him. On one occasion the Chancellor said to Lasker that he anticipated his becoming his colleague, whereupon the latter archly replied: "Does your Highness intend to become a lawyer?" This was, of course, in 1873 or 1874. After 1879 the contrast between the two men was aggravated by the political diversion of the Chancellor. He now made Lasker and his political friends responsible for all the shortcomings and failures of his plans. "The worst crises," he once said, "have always been caused by Lasker. If it had not been for him, I should never have thought of resigning. It was he who, reasoning and acting from a lawyer-like standpoint, destroyed some of my best plans, who paved the way for several triumphs of the Ultramontane party, and who even tried to prescribe to me how Alsace-Lorraine ought to be governed."

Thirdly, and not least, it is the Reichstag against which the return of the resolution of the House is directed. Whatever Bismarck can do to break its great moral and small political influence he does. He seizes each and every opportunity of discrediting it. His press organs are directed methodically to degrade it in public opinion. On the other hand, he cannot govern without it, and above all things he is not powerful enough to abolish universal suffrage, which he introduced himself. So he must content himself with smaller political adventures, as, for instance, the attempt to combine universal suffrage with open voting. In the meantime the Conservative press is ordered to speak of the Reichstag in a depreciating tone, and to represent its Liberal members as a lot of tricksters, who, led merely by party considerations, prevent the Chancellor from carrying out his large schemes, and from benefiting the people as fully as he wishes.

These Liberal members intend to move for a resolution of thanks to the Washington House of Representatives when the Reichstag convenes on March 6. Whether a motion of this or a similar character can be carried is rather doubtful, as the vote of the Centre will be dictated by the general state of public affairs. If they can reasonably expect to make political capital out of this vote, they of course will reject the motion and stand on the side of Bismarck; but, even taking it for granted that the Liberals will be defeated, they regard it as their duty not to keep silent, and eventually to refer the question to the Committee on Rules and Regulations for ultimate settlement.

It requires some self-restraint to mention in a few closing words the tone and comments of the official press. All the hounds of the Reptile Fund have been let loose to manifest their meanness coupled with ignorance. The *Deutsches Tageblatt*, the organ of our princely and baronial agrarians, vies with Bismarck's official paper, the *Norddeutsche Allgemeine Zeitung*, in blackguardism and false representations or frivolous attacks. The former says that Mr. Sargent is a corrupt speculator and railroad swindler, laden with the curses of numberless victims. The other accuses your House of Representatives of having turned Lasker's death to account for party purposes. The followers of the same class of writers attack the resolution as an interference with German home matters; others again pretend, in high-sounding terms, that the whole is an American electioneering trick. Such is the ignorance of these penny-a-liners that they believe that the Republicans of the House resorted to their compliments to Lasker, in order to maintain their power at the next Presi-

dential election. They do not know that the Democrats already hold the majority in the present House, and that they will, of course, not vote or work against themselves, while the Republicans are still in the possession of all the other branches of the Government.

The most ridiculous part of the whole story is, that these identical papers, in order to give their knowingly false statements a still more sensational character, not only say that Mr. Sargent went for information to the Free Trade, Liberal, and Radical parties, but also insolently intimate that the whole resolution of your House was made here by members of the Reichstag who write and speak English, and sent to Washington, with directions to have it adopted at once and sent back to the Chancellor. Now, the death of Mr. Lasker became known here on January 6, and the resolution was passed on January 9; but such minor details are of no account to these newsmongers. The less likely their slanders are, the better they are paid for them.

†††

THE YOUTH OF MICHELET.

PARIS, February 23.

MME. MICHELET has collected with the greatest care all the papers of her illustrious husband. She informs us, in the preface of a book entitled 'My Youth,' that this work was made from notes left by him with a view to the publication of memoirs of his life. Michelet made a first attempt of this sort in 1820. He had a dear friend, Paul Poinsot, and began his autobiography chiefly for him. Poinsot died in 1821, and Michelet thought of other things. "Time advances," he wrote in 1864; "I shall probably never compose my memoirs, but I will leave all the elements of it in my notes, in my journals, which I have written with regularity since 1838; in the programmes of my books, in my inedited lectures at the Collège de France, where I so often brought before my public a heart bleeding with the wounds of my country and with its own wounds." Michelet was a solitary man; he did not live in the world, and he wrote much, he said, "pro remedio animæ meæ."

What, exactly, is Mme. Michelet's part in this volume, which is the biography of Michelet during his youth? It would be difficult to say. Mme. Michelet thinks it necessary to give some details about herself. She was born at Montauban; her grandfather was born in Auvergne; her mother was a creole of Louisiana. She was married to Michelet at the beginning of the Second Empire. She found herself at once very poor, as Michelet refused to take the oath to the new régime, and lost all his places at the Collège de France and at the Archives. His books, which had been used in the colleges of the French University, were struck off the list. He had no fortune, and he left Paris with his young wife. They lived in the country, and Mme. Michelet became the only pupil of the eloquent professor. She was devoted to him, and she charmed his exile from Paris. One day, she reports, he said to her: "My mind will owe to you its greatest joy in this world—a joy which assimilates man to God. I took you half awake from the hands of nature, and I have been your Prometheus." He could not live out of her sight. She was his second wife. His first marriage had not been a happy one, for his first wife had a cerebral disease. Michelet's nature was all tenderness and gentleness; it was essentially poetical. "With women," he said, "the ideal ought to be always mixed up with the real." Michelet was much older than his second wife, who was his pupil, his confidante, his solace. This perfect community of sentiment will not help us to answer the question which I put a moment ago—Where begins and where ends the part of Michelet in this autobiography? Let us take it as it is, as a sort of mixed work, without troubling ourselves too much about its precise origin.

The father of Michelet was a Picard, born in the town of Laon; his grandfather was a professor of music and *maître de chapelle* in the Cathedral Church. Laon, with its many churches, built on a hill, may be called a clerical city. Michelet's father became in his youth a great favorite with the priests and the nuns; his family intended to make a priest of him. He was presented to the Abbé de Bourbon, a natural son of Louis XV. and of Mme. de Romans. "The Abbé, a young prince twenty-three years old, with half a million of ecclesiastical revenues, very handsome, amiable, and worldly, was at his toilet, half powdered. He rose, took my father into his cabinet, talked to him, found in him a man of the world, without any ecclesiastical vocation. He patted him on the shoulder: 'Very well, my friend, very well, I am pleased with you. I make you a Canon.'" The French Revolution decided his fate otherwise. Michelet's father went to Paris, where he arrived a month after the famous massacres of September. He became a printer, and was first employed in the printing of the *assignats*. After the 9th Thermidor, the revolution which put an end to the atrocious rule of Robespierre, he bought a printing-office and ceased to be a mere workman. Michelet was born in 1798. His family lived in the Rue Saint Denis, in a church which had once belonged to the Hôtel Saint-Chaumont (where the Duc de la Feuillade cast in secret the bronze equestrian statue of Louis XIV. which he offered to the King, and which stood on the site of the one that now adorns the Place des Victoires). The church was now empty and served as a printing-office. The child was born in the very choir, and his father named him Jules. "If the Republic lasts," he said, "it will be Julius Cæsar; if Catholicism triumphs, it will be Pope Julius."

Young Michelet was very delicate, nervous, of an extraordinary sensibility, timid, full of imagination. His father was very poor; printing was not encouraged after the excesses of the French Revolution. He soon found himself in great difficulties. The family left the Rue Saint-Denis and settled on the other side of the Seine, in the Rue des Saints-Pères; Michelet remembered having often suffered there from cold and from hunger. He remembered a usurer who had lent money to his father, and who often came to insult and threaten him. One day he learned that his father had been arrested and sent to the Prison of Sainte-Pélagie. At that period Michelet, in his dark home in the Rue des Saints-Pères, in his extreme poverty, found, he says, a great solace in religion. He had received no religious instruction—his parents had forgotten to have him baptized. His father had the philosophical notions of the end of the eighteenth century; the boy was never taken to church, and was afraid of the black vestments of the priests. "The utter neglect in instructing me was precisely what helped me. In the great distress in which we found ourselves, a solitary instinct inclined me to open a book of piety. It was the 'Imitation of Christ,' preceded by the service of the mass. How shall I describe the state of dream into which I was thrown by the first words of this book? These dialogues between God and a suffering soul, as was mine, touched me profoundly. . . . I heard . . . as if a soft and paternal voice had spoken to myself."

What suffering soul, bleeding from hidden wounds, broken under the weight of life, tired to death, has not found a bitter solace and, by degrees, a sort of rest in this miraculous work, the 'Imitation'? Michelet had a pure and poetical mind, and was able to feel and to receive, as it were, its beauty; he saw, at the end of this painful life, deliverance and hope; he learned the fortifying virtue of solitude. During all his life he remained, in a certain sense, solitary. He experienced religion in a purely abstract manner, without any human intermediary, without the assistance of any priest. "Religion," said he, "thus remained a thing which was mine; it remained free, so well mixed with my life that it could feed with me and fortify itself on the road with a number of tender and holy things in art and in poetry—things which are often erroneously thought independent of it."

The 'Imitation,' however, has its dangers: it produces indifference, a languid contempt of realities; it acts on the soul as opium acts on the nerves. But Michelet was too young to feel its dangers. His father, after a while, left the prison into which a hard creditor had thrown him. He made a composition with him, and opened a new printing-office. The printing was chiefly done by the family—by the old grandfather, by the mother as well as by the father. Young Michelet became himself a printer. He worked in a cellar, on the Boulevard Saint-Martin. At the age of twelve he was sent to school and learned a little Latin. He found a friend, and began to open his eyes on the world, to inquire about the Emperor Napoleon, his perpetual wars, the conscription which took generation after generation. "Nothing," he says, "better helped me to understand the dark monotony of the middle ages, the expectation without a hope, without a desire, except the desire of death, so well as the languid years which, as a child, I spent during the last period of the Empire." He had no holidays or Sundays; he was kept all day at the printing-office.

After the disasters of the Russian campaign, a decree reduced the number of printers to sixty. The printing-office of Michelet's father was shut with an official seal. Once more the family were ruined. His mother fell ill. His father decided, nevertheless, that the boy should leave school and enter a lycée. The Lycée Charlemagne is still one of the great lyceums of Paris. Young Michelet, timid and awkward as he was, thrown among hundreds of rude boys, was at first very unhappy. "Cet âge est sans pitié," says Lafontaine. The genus "boy" develops all its most hateful characteristics in a Parisian lycée. The beginnings were hard, but Michelet soon found himself, somewhat to his own astonishment, at the head of the class. "On the 3d of May, an admirable spring day, King Louis XVIII. made his first entry in Paris, where his brother had preceded him. We were at school; we heard the distant guns of Vincennes. Somebody said, 'It is the return of the Bourbons.' We looked at each other; we did not know them." Long years of revolution and of war had unnerved France and destroyed all interest in the affairs of the country. Never had the Michelet family been so miserable. Michelet tells us that he often left home for his lycée with an empty stomach. He was sixteen years old, and he never ate any meat; he sometimes felt the effects of inanition during his lessons. He was not allowed to grow; he remained all his lifetime weak and frail. It is difficult to imagine what his genius would have been if his body had been more robust, and if hunger had not been one of the torments of his youth.

In 1815 he lost his grandfather and his mother. His studies were constantly disturbed by domestic troubles, and also by political events. The return of Napoleon from Elba, Waterloo, the occupation of Paris by the Allies—such events produced an immense perturbation even in the colleges. Michelet's father, after the death of

his wife, entered as assistant an asylum for lunatics kept by a Doctor Duchemin. Nothing can be more injurious to a young mind than contact with insane people. Young Michelet spent three years in this house of Doctor Duchemin, with his father; he only felt at first the pleasure of a little comfort, which to him was a novelty, but he did not long remain insensible to the sufferings which were hidden in his new abode.

Michelet had a great triumph at the end of his classical studies: he obtained the first prize of rhetoric at the *concours général* (an annual competition of the best scholars of all the lycées of Paris). The crown was given to him by the hero of the day, the Duc de Richelieu, who, owing to his great friendship with the Emperor Alexander of Russia, had succeeded in keeping for France Alsace and Lorraine, after the defeat at Waterloo. The young Michelet was almost overpowered by his own success; he was presented by M. Villemain to the Count Decazes and to the Duc de Richelieu. Was he a royalist? He did not himself know at the time. His father had seen Louis XVI. in the prison of the Temple, and had been moved with pity by the misfortunes of the royal family. He was not a Bonapartist—he was sure of that; but, so far, he had not chosen his party. He was drawn to literature more than to politics; he became a tutor in a school, and was able to earn his bread. The most humble position appeared to him like a paradise. He began to read Rousseau with much enthusiasm; the sentimentality of Rousseau, his love of nature, were powerful attractions. It can be said, on the whole, that the development of the mind of Michelet was very slow, and the young teacher of the Institution Briand had much to learn before he became the renovator of historical studies in France and the powerful assistant of the great Romantic school.

Correspondence.

THE CASE OF JUDGE LOCKE.

To the Editor of The Nation:

Sir: I was very much surprised and disappointed on reading your article upon the proposed impeachment of Judge Locke, appearing in your issue of February 28—surprised, because, from reading your paper some fifteen years, I had come to regard it as generally fair and just, which in this instance it is not; and disappointed, because of your ready credence and acceptance as true of charges as yet not proven nor even answered. Your comments upon such conduct as is charged against Judge Locke are very entertaining and pointed, and the moral you draw from the premises as stated by you is very just, only—the premises are false; and it really seems to me that upon their face the charges have an appearance suspicious enough to cause hesitation in accepting them as true. That Judge Locke will be completely exonerated upon investigation is confidently believed by his friends and by those acquainted with the facts; but after that is done, hundreds who have read your pungent articles will not notice it or hear of it, while your pointed criticisms *will* remain in their recollection, prejudicing them against Judge Locke, and perhaps against the whole judiciary. You thus do Judge Locke a great injury, and with a class whose good opinion and esteem is worth having—for such are your readers. I will therefore state for your information a few facts in the case, trusting to your own sense of right to do what justice requires.

Judge Locke was appointed District Judge in 1872, upon the recommendation of both Republicans and Democrats. The entire bar of the district at that time were Democrats, with a single exception, and they all joined in asking his appointment. He surrendered a practice and business far more profitable than the office he accepted, and resigned the political offices which he then held. From that day he has filled the position of Judge with satisfaction to the members of the bar and litigants, both in this district and in others where he has sat by assignment. When it was rumored that these charges were to be made against him, the lawyers of the district, unsolicited, joined in a testimonial as to his character, and among them were both Democrats and Republicans. Even you, a year ago, had a word of praise for the manner in which he vindicated the honor of the court in a case of disbarment. But, as the Savannah *News* says, he was not "satisfactory to some Federal office-holders" and politicians. Time and again he has refused to create an army of deputy marshals for use of the "bosses" at the polls. In no way would he let his court be used as a tool by the local "boss" (a Collector of Customs, from New York); and therefore he is made to suffer—not impeachment: there is no danger of that—but the gibes and sarcasms of the press and the notoriety of this investigation.

As to the substance of the charges, I would say that handing $25 on one single occasion—for there is but one such charge—to a politician, to help along a local campaign, is not "improperly approaching and influencing voters." To contribute to the expenses of a campaign is a right which any man, whether a judge or not, may exercise as suits him. If the Judge had paid assessments to the local "boss," probably nothing would have been heard of this!

2d. The records of the court show that the ship *St. James* was wrecked in November, 1871. At that time Judge Locke had *not* been appointed as Judge, and owned one-half of a small twelve-ton schooner, the *Pelican*, engaged in sponging. She went to the wreck and saved forty bars of railroad iron, which was libelled for salvage in January, 1872. Five months after the salvage service was rendered, Judge Locke was appointed, and entered upon the duties of his office. He immediately sold his interest in the *Pelican*, and the records show that that one-half which he had owned neither *applied for* nor *received one cent of salvage*; and in the decree delivered by him it is especially stated that half of the *Pelican* should receive *no salvage*. Neither the Judge nor the person to whom he sold his interest received one cent for her work at the wreck, though many lawyers and others at the time thought that the Judge was over-scrupulous in not decreeing her salvage, as the service was rendered before he was on the bench. Now, twelve years afterward, this *false* charge is trumped up in the shape in which it appears in your columns. The contributing $25 toward a Republican campaign was also in 1872, twelve years ago. Strange that it has only just been discovered.

3d. The charge of "pawnbroking" is totally false, and is made, not with any expectation of being sustained, but simply to smirch the Judge's good name. I have in my possession an affidavit of the person named in the charge as the pawner denying the charge, and it will be presented when wanted; I send you a copy of it. It was made last year at the time the Collector of Customs here first started the story.

4th. The charge of illicit dealing in tobacco is of the same nature. It was made in malice by the Collector of Customs last summer, was investigated by the Internal Revenue Department, and decided in favor of Judge Locke. That he lent a friend money is true, but it was to accommodate him; that he was secured by tobacco in the bonded warehouse is true, but it was a legitimate transaction, not conflicting with the Judge's duties, and, as an investment even, was as fair as any ever made by any one in land, houses, or stocks, tobacco being a staple article here. That these loans were made from the Judge's private means, no one who knows what a judge's salary is can doubt.

Your conclusion that the assessment of $46.88 was a "political" one is also erroneous. It was part of the inquiry into the tobacco business, asking him why he should not pay that amount for a license as a dealer. He showed to the satisfaction of the Department why he should not be considered as a dealer, as their records show, and the enclosed copy of letters.

I would now ask you candidly if two such loans as these, made to friends as an accommodation, during a period of twelve years, warrant an accusation of "eking out his scanty income by pawnbroking and usury and by illicit dealing in tobacco"; yet you have held him up to your readers in that light.

I enclose you certain documents substantiating my statements above, and while I cannot ask you to devote your space to the publication of all this, I think that in justice you should let your readers know that there are two sides to the question; and, in justice to the accused, a man known by all his acquaintances to be over-scrupulous and conscientious, devoted to the duties of his position and jealous of its dignity, as is shown by the stand he took in disbarring an attorney in the face of universal public prejudice two years ago, you should set aside your finding, for newly discovered evidence, and not help tarnish the good name of one who has no other fortune.

Of the character of his accusers and their motives much could be said that would throw considerable light upon political affairs in this section, showing how "satraps" are sent out from the central government to control the Republican "provinces"; the manner in which they try to do it; the way the Government patronage is distributed; the way Republican "bosses" and Bourbon "colonels" combine to beat and cheat the decent men of both parties. But I will not seem to try to make out my case by abusing others, but will withhold my experience with the political ringsters until some future day, when, if the good of Republicanism and the community requires it, I can make some revelations that will astonish those unfamiliar with politics in "Dixie."

I will only add that I write this without the knowledge of Judge Locke, who is absent holding court in Tampa. With full confidence that you will be willing to do justice in this matter, I remain your constant reader, and in all cases but this, your admirer,

Eugene O. Locke.

Key West, Fla., March 11, 1884.

[We never undertook to prejudge the case, but referred to the charges which are on file at Washington and are a perfectly legitimate subject for comment by any newspaper. The discussion of them will not injure the Judge if he is innocent, but will merely cover his enemies with confusion.—Ed. Nation.]

CASH AND THE STATE OF SOUTH CAROLINA.

To the Editor of The Nation:

Sir: In No. 947 of the *Nation*, you intimate that in South Carolina the society is not really

civilized; that the great part of the citizens of this State who pass as "gentlemen" are "drunken, armed ruffians"—criminals, indeed, who "run loose till they commit deliberate, unprovoked murder." The individual case on which you were commenting does not justify such general inferences as you drew from it. I enclose a statement clipped from the *News and Courier* to prove this. It shows that the Executive power of the State is doing its duty to bring the criminal to justice. It shows that it was not the fault of our State Government that this criminal was allowed to run loose until he committed deliberate, unprovoked murder, but that it is the fault of the United States Government, whose authorities had taken him out of the custody of the State and had set him free.

Are our people to be continually calumniated as allowing crime to go unpunished, when the United States Government fosters a crowd of lawless, unprincipled employees in our midst, and protects them in their lawless deeds from local justice? When one in the employ of the United States Government commits a crime here, he simply carries his case to the Federal Court and feels that he is safe from punishment. Will you not raise your voice against *this* evil?

We thank you for your good intentions in trying to correct the evil of unpunished homicide, and we do not, in any case, sympathize with or try to excuse criminals; but we think that you have done the people of South Carolina an injustice, and that you should do all in your power to correct it. And as you have begun to comment on the W. B Cash affair, you ought not to drop it leaving a wrong impression upon the minds of your readers. The Government and people of South Carolina are showing, as plainly as can be shown, that they do not "bolster up such people" in their acts of violence.

W. Z.

State of South Carolina, March 10, 1884.

[We append a part of the extract referred to. Meantime, the elder Cash has been set free on a ridiculous bail, and the pursuit of his son has, it is said, been given over.—Ed. Nation.]

"Cash's Political Antecedents.—No doubt the Stalwart organs at the North are rioting in glee on account of the doings of W. B. Cash, assumed by them to be a typical South Carolina Democrat. It is but just to Mr. Cash and the aforementioned organs, therefore, to let it be known that Mr. W. Bogan Cash is not a Democrat, but an 'Independent' or Republican, lately or now in the employ of the United States Government. W. Bogan Cash is the same man who was arrested here last spring for assaulting without justification an old and feeble Democrat from Fairfield County. He is the same man who was held by the State authorities for carrying concealed weapons here in defiance of State law. He is the same man who was defended before the Mayor and before the trial justice by Mr. William Penn Snider, special counsel for the United States in the election cases. He is the same man who was taken out of the custody of the State by the United States authorities, for the reason that he held a deputy marshal's commission while he attempted to terrorize old men in this quiet town. He is the same man who, immediately after his release from State control, acted as a spy in Chester County and arrested white Democrats. His forfeited pistols, which were taken from the State by the United States authorities, were doubtless returned to him, and it is not improbaole that he killed Marshal Richards with one of them. N. G. G."

EXCESSIVE LEGISLATION.

To the Editor of The Nation:

Sir: The people of this country have endured so long the unscientific methods of law-making practised by our legislatures that it is not probable that much immediate good will result from general recognition of the evil of over-production of statutes. But the evil is so great and, to those familiar with the application of written law to every-day affairs, so apparent, that in the end good must result from the discussion of it. When the people understand that the number of laws the passage of which a legislator obtains is not the measure of his excellence, the unhappy fecundity of the brains of our manufacturers of statutes may be checked. Among the many abuses which affect the making of laws, the influence of merely local considerations is not the least. While constitutional provisions may do much to remedy this evil, it is important that the people should remember that the causes which in time past have produced laws ridiculous in their local character, may produce other effects of a similar kind. But in most of the States the evil complained of exists without check other than such as may be afforded by public opinion; and public opinion must be educated up to an appreciation of some of the common-sense rudimentary principles of statute-making.

The uncle of the honorable member from the Township of Squirrel-track in Sawdust County has lost a fence which was fired by sparks from a railway locomotive. A heifer belonging to the son-in-law of the uncle of the honorable member from Squirrel-track, having walked through another fence, more or less rotten, has been killed by the same locomotive. What is the result? That the honorable member, his public spirit aroused by these little family misfortunes, obtains the passage of a bill regulating the matter of fences along the lines of railways throughout the State? Not so! What does the honorable member from Sawdust County care for the fences and the heifers of the uncles and of the sons-in-law of the uncles of honorable members from other counties? Let those honorable members look out for the fences and the heifers of their own uncles and of their own uncles' sons in-law. But his private spirit is aroused; and the bill which he introduces, and which his fellow-statesmen pass, provides that the company owning the locomotive which has made havoc with the property of his uncle and of his uncle's son-in-law, shall keep up fences along its line—in the Township of Squirrel-track in the County of Sawdust. That is enough for the protection of his uncle and his uncle's son-in-law.

Under similar circumstances, other laws of like character are passed, each confined in its operation within narrow geographical limits, and each differing in important details from all the others. They may accomplish good results within those limits. Any radical member who suspects that they may not be based upon sound principles of legislation, lulls the suspicion with the conclusive argument that, as each bill will accomplish good results, to oppose it would be wrong. In the end, several local statutes are passed upon a subject as to which the law of the State should be uniform. No man knows, without careful investigation, whether his fence and his neighbor's fence stand under the same or under different laws. Instead of the single compact statute which should control, the people have eleven inharmonious local laws, regulating the matter in four counties and in parts of three counties, out of twenty-three.

A brief review of the laws of Pennsylvania upon the subject of fences and cattle-guards along the lines of railways will show that the imaginary laws just described are not much more absurd than those to be found in the statute-books. In that State are seven statutes requiring railway companies to provide fences and cattle-guards. Each of two of these requires one specified railway company to build and keep in repair in one specified county "sufficient and lawful fences," and, at all "public crossings," "good and sufficient" cattle-guards. Each of three of the rest provides for the building and the keeping up of fences in one specified county by all railway companies having lines in that county. The three differ so in detail that a full comparison of them would take no small amount of labor. Two of them require companies to build cattle-guards at all crossings. One of these two provides for, and one does not provide for, the maintaining of cattle-guards after they are built. Of the two remaining acts, each is supplementary to one or another of those already mentioned. One of the supplementary acts extends one of the special county statutes to three additional counties. Here, then, are seven local statutes upon a subject of a character essentially not local, the seven affecting eight counties, and establishing four distinct systems of law. Why, this is the very March madness of law-making! And all these statutes except two were passed within about a year of one another, so that the Legislature must have known of the existence of those already passed.

This case is taken as typical. The statute-books of other States than Pennsylvania will show many such cases.—Very truly yours,

James Pryor.

21 Courtlandt Street,
New York, March 12, 1884.

THE INDIAN QUESTION.

To the Editor of The Nation:

Sir: The leading article in a late number of the *Morning Star*, a little paper published at the Indian Training School, Carlisle, Pa., upon the subject of educating and civilizing the Indian race, closes with the following words: "Must it always be *en masse* or not at all?" I consider this the keynote to the complete settlement of the Indian problem. The thing to do is, in brief, just exactly the reverse of what our Government has always done. Instead of keeping the Indians shut up on reservations, isolated from civilizing influences, let us teach them our life by bringing them in direct contact with civilization as we understand it.

The first thing to do is to pass a general law applicable to all Indians, providing that their homesteads shall be inalienable for a term of years, as is now provided by treaty with a few tribes. Nearly all Indians are incompetent to manage their business affairs, and the Government will have to watch over them as wards in fact, and the way to do it is to pass this law. The few who may be competent will have to suffer some inconvenience for the good of the many. The term of years for which the homesteads should be inalienable might be longer or shorter for different Indians, at the discretion of the Secretary of the Interior and Commissioner of Indian Affairs—none for less than ten years, however; or, the law might permit certain Indians to sell one-fourth part of their allotments after ten years, provided the sale was ordered in each instance by the Secretary or Commissioner. It was the failure to have such a law that has ruined so many Indians after they had got fairly started to live rightly and their lands had been patented to them.

After the law making the homesteads of the Indians inalienable is passed and in operation (but not before), let the Government proceed to abolish all Indian reservations by opening for settlement alternate sections throughout the Indian country, in order that the Indians may learn from the example of their white neighbors the superiority of the white man's manner of living. Right here I fear the party of good intentions, but likewise the party that is most unacquainted with the Indian people, will rise up and with tongue and pen—they are mostly people who know how to use both weapons—de-

nounce this suggestion as an attempt to perpetrate another great wrong upon the Indians. But I maintain that it is for the good of the Indians that I would do the thing I now propose. It might be advisable for the Secretary of the Interior to invite religious societies to colonize (under the homestead law, of course) the sections taken away from the Indians. I think it would be a very good thing indeed to make some effort to get a good class of people to occupy these sections—people who would at least be disposed to do the Indians simple justice in any and all disputes which might arise between the two races.

Most tribes have a great deal more land in their reservations than they need or can use; and if the Government secures permanently to each individual Indian a homestead, and helps him with houses, with stock, and with implements, to establish himself upon that homestead, it is enough. It is not proposed to take away from them a single section that is now acknowledged to be theirs without paying them for it; and the fund accruing to them from the sections so taken would be ample to establish each head of a family, at least, upon his homestead, give him a few head of stock, and subsist the tribe while getting started and as long as they ought to be aided in that way, and leave a fund for the support of their schools. From this fund also could be provided the proportion which the Indians ought in justice to the community to pay for the building of roads and bridges, and, where necessary, irrigating canals. To do all this Congress need not, and ought not to, appropriate a single dollar except in payment for the sections taken away from the Indians. A few tribes may need a little additional aid, but the most will not.

Of course it is expected that the Government would see, and that philanthropic people would help it to see, that the moneys due the Indians were honestly expended in the way indicated. And, I ask, could any people demand more than this from any government? If these things are honestly done, in all kindness, as it is intended they shall be, and it appears that the Indian cannot endure civilization even under such favorable circumstances, and is destined to become extinct, the most scrupulous humanitarian can find no cause for complaint. The Indians would still need to have agents, with their force of employees, for a few years, to instruct them in farming and the care of stock; to see that they received what was due and sent them by the Government; and to see that they suffered no injustice from their white neighbors or from each other—in other words, to see that they received justice in the courts. It is true that it would require some force to carry out this plan for civilizing Indians; but the time has come when the Indian people ought to be *governed*, and there is no way to govern a portion of them, at least, without the employment of force. And I consider that the most important thing to do to civilize Indians is to *govern* them. I presume that there is no person who will not admit that the Indians ought to be governed. By admitting this much, they of necessity concede that force must be used. The only question, then, is as to the manner of applying this force. The sooner it is done, the better it will be for the Indian people.

When I recommend the employment of force, it is not expected that we shall come to blows. All that is necessary is to have the force on hand; then explain to the Indians, kindly but firmly, what we intend to do, why we do it, and what we expect them to do; then go ahead and carry out our policy honestly and fairly, and if they then rebel against that policy they must feel the power of the Government. I have no fears for the result of this proposed policy. I have great fears for the future of the Indians if the old and present manner of managing them and their affairs is continued. I believe that more can be accomplished for the good of the Indians in four years in the way I suggest than in twenty-five years under the reservation system as at present. In fact, I am convinced that the reservation system can *never* be *completely* successful.—Very respectfully,

JACQUES.

CROW INDIAN AGENCY,
MONTANA, March 7, 1884.

HEADS OF BUREAUX IN CIVIL-SERVICE REFORM.

TO THE EDITOR OF THE NATION:

SIR: In the recent discussions of the civil service and movements for its improvement, attention has been chiefly directed to the lower grades of the service, and particularly to the class designated as "clerks." But immediately above the clerks, and between them and the heads of the departments, is a class of subordinate officers, the assistant secretaries and the heads of bureaux, these latter known as commissioners, auditors, comptrollers, and by other names. These subordinate officers, except on a few of the most important questions of policy, and on some chance questions in which the head of a department may happen to feel a special interest, control generally the action of the department. It is not too much to say that the daily business conduct of the departments is in the hands of these officers. On the one hand, they largely direct the action of the head of the department; for this is quite generally based on the recommendations of these subordinates and on papers selected and digested by them. On the other hand, they are next in authority over the clerks; to them the clerical force is immediately responsible for the quality and quantity of daily work. If the heads of bureaux in a department are good executives, the clerical force of that department will be carefully disposed, so as to work efficiently and economically. Rules controlling both the diligence and the methods of the clerks will be laid down, and, because of the nearness of the bureau officers, these rules will be enforced. If these officers are enlightened upon the questions both of policy and of private right which come before them for decision, and are practical in their methods, the administration of the department will produce respect and general satisfaction among those who are in any way dependent on governmental action. The efficiency of these subordinate officers, in whose hands is the daily administration of affairs, is of far greater importance, under our system of government, than the efficiency of the heads of the departments.

The proper work of the head of a bureau is always difficult. It needs for its due performance diverse talents, of high order. The Commissioner of Pensions is charged with responsibility for the work of over fifteen hundred employees in his office; the Commissioner of the General Land Office and the Sixth Auditor of the Treasury, for over three hundred each. These are examples. The proper government of so large a number of subordinates is never an easy task. Its difficulty is increased when the responsibility for their work is in the hands of one officer, and their promotion or dismissal in the hands of another, who is subject in his action to influences not connected with the welfare of the service. The legal questions which fall within the jurisdiction of the head of a bureau are involved, requiring legal ability of a high order. The First and Second Comptrollers and the Commissioner of Customs in the Treasury Department are law officers, who have to decide on the legality of all expenditures from the Treasury. Properly to construe the large body of statutory law before them, and to determine intricate questions of express and implied contract, so as to settle properly the boundaries of governmental and individual right, is a work of great magnitude. Questions of administrative policy—such, for instance, as require the decision of the Commissioner of Indian Affairs—are no less difficult. A good bureau officer needs to add to high legal talent executive ability of no usual order, and to make use of these with untiring industry.

That the bureau officers generally fail to reach the proper requirements of their positions, or, to put it stronger, that they are generally very inefficient, will not, I think, be denied by those who have had opportunity for an intimate acquaintance with the workings of the departments here. The deficiencies of the clerks, who are generally far better fitted for their work than the heads of the bureaus for theirs, would be in great part remedied by better superior officers. The chief of a bureau who is chief in anything but name is the exception rather than the rule. He very often does little more than sign papers prepared by his subordinates, follow their advice, and pursue a careful negative course that can give no one any reason for seeking his removal. The real authority in a bureau is very often divided among the heads of its various divisions, and the strange spectacle is presented of the policy of the bureau being liberal in regard to one part of its jurisdiction and narrow in another, according to the cast of mind of the clerks at the head of the several divisions. "Well, I will see what 'the boys' have to say to this," said the head of one bureau to me, in regard to a matter of official business. "The heads of division run our office," said a Treasury clerk to me. "What sort of a man is the head of your office?" I asked another clerk of twenty years' service. "That makes no difference," he answered, "as long as the present Deputy holds his place." A well-known Senator of the same party as the Administration said a few days ago: "These bureau officers know nothing except what they learn from their twelve and fourteen-hundred-dollar clerks."

The primary reason for inefficiency in these positions is that special fitness for these offices is not the basis of selection. The secondary reason is that the salaries are not large enough to attract men of sufficient ability. In the Treasury Department (the figures are from the last appropriation act) the Treasurer and the Commissioner of Internal Revenue receive $6,000 a year; the Comptrollers, $5,000; the Commissioner of Customs and the Register, $4,000; the Auditors, $3,600. In the Interior Department, the Commissioner of Pensions receives $5,000; the Commissioners of Patents and of Railroads, $4,500; and the Commissioners of the General Land Office and of Indian Affairs, $4,000. The three Assistant Postmasters-General, really heads of bureaux in the Post-office Department, receive $4,000 each. There can be but little doubt that a better class of men in these positions would easily save much more than the increase of their own salaries by a more economical use of their employees.

But no increase of salary will be of use until fitness for the position and not political service becomes the qualification for appointment. Under our present system, our chiefs of bureaux are, as a rule, either successful local politicians, like the First Assistant Postmaster-General, Mr. Frank Hatton, or defeated ex-Congressmen, like the Commissioner of Patents, Mr. Benjamin Butterworth. Occasionally an officer selected for political reasons happens to show himself well qualified for his place; it is a matter of chance.

The instances of bureau officers who have been promoted from clerkships are so few—and of these few the promotions have so largely been on political grounds—that it is not possible to say from actual trial what the effect of the general adoption of such a system would be. The recent promotion of Mr. Henry D. Lyman to the office of Second Assistant Postmaster-General, in whose bureau he had been chief clerk, and before that a subordinate, will give an opportunity for observation upon the effect of promotion from the ranks for conspicuous merit.

In some cases it is necessary for bureau officers to be in accord with the ruling policy of the party in power; generally they have nothing to do with this. The duties of a bureau officer, as a rule, are to carry out the law efficiently and economically. In the Treasury Department the six Auditors, the two Comptrollers, the Commissioner of Customs, the Register, the Director of the Mint, the Chief of the Bureau of Engraving and Printing, have nothing to do with party policy. Nearly the same is true of the three Assistant Postmasters-General, as well as the other heads of bureau in the Post-office Department. Even if a change of policy demands a change of subordinate executive officers, fitness for the place, among those of accordant policy, should be the sole test for selection.

This is the fundamental principle of true reform in the civil service; it is as applicable to the higher grades of the service as to the lower. When it is so applied we shall no longer find the heads of bureaux, as in so many cases we find them now, conspicuous for their inefficiency.

W. B. K.

Washington, D. C., March 13, 1884.

CHARLES READE AND MME. REYBAUD.

To the Editor of The Nation:

Sir: "The Portrait in My Uncle's Dining-room," published in *Littell's Living Age* for November, 1869, is a *literal* translation from the French tale, 'Mlle. de Malepeire,' by Mme. Charles Reybaud, published by Hachette & Co. in 1856; so well known that I am surprised your Michigan correspondent should have wasted so much ingenuity in order to discover its author in Lady Georgiana Fullerton. F. D. P.

Boston, March 14, 1884.

SHAKSPERE'S SOLFEGGIO.

To the Editor of The Nation:

Sir: Your criticism of the 'Riverside Shakspere' is none too severe. It almost deserves to be called the "swaggering edition," and I am glad that a part of the truth about it has been plainly spoken. On one point, however, I would suggest that your reviewer may be in error. He says that the notes sung by *Edmund*—fa, sol, la, mi—are F, G, A, E, instead of F, G, A, *B*, as stated by Mr. White. So I thought when I first read the note on that passage: but afterward it occurred to me that I had heard my father say that when he learned to sing—perhaps sixty or sixty-five years ago—the syllables taught were fa, sol, la, fa, sol, la, mi, fa, instead of do, re, mi, etc., as we now hear them. Possibly the same system prevailed in Stratford when Shakspere used to attend the evening singing schools and go home with Ann Hathaway. E. E. L.

Greenfield, Mass., March 14, 1884.

PRAYER.

To the Editor of The Nation:

Sir: In No. 976 of the *Nation* one of your correspondents quotes from Bishop Warren: "We cannot understand God's plans enough to know whether or not to pray for her recovery"—which is very suggestive.

It reminds me how, when I was a boy and had my Sunday-school teacher and my sled, I used in winter to pray for snow; and how awed I felt on one occasion when snow came in answer to my prayer, and I realized I was responsible for it. Even then I knew the poor do not enjoy snow. And, indeed, granting that by prayer we do obtain our wishes, how do we justify ourselves in changing the plans of God?

It also reminds me of what I once heard an Episcopal missionary, Bishop Penick, say. In speaking of his African experiences, he told us that on one occasion, while he was urging some savages to pray to God, the good all-giver, one of them asked why he should pray to God, who sought only to do him good, rather than to the devil, who was prowling round to destroy him. (These are my own words.) And I join with this poor savage in asking, Why? I know a clerk who in a late municipal contest expended all his blandishments on the opponent of his chief and friend. He reasoned thus: "If my chief is reëlected he will keep me in my place, for he is just and a civil-service reformer; but if he is beaten his opponent will remove me unless he likes me, for he is a mere politician."

It is only in families where the parents are weak and silly that one finds the children teasing for this or that; children who trust in them do not seek to change their parents' decisions and plans. The whole spirit of modern dealing with the needy is not to help them, but to make them self-reliant. Beggars are the least respectable of all classes; begging is an insidious vice, and why is it worse to beg of man than to beg of God?

Is not the only prayer a trustful thinking soul can utter something like this: "Oh God, thou art good; thou carest for me; thy will be done"? D. S.

Baltimore, March 16, 1884.

Notes.

Dodd, Mead & Co. will publish immediately a students' edition of their five-volume issue of Rawlinson's 'Monarchies of the Ancient Eastern World,' from the same plates but with smaller margins and less costly paper. They have begun delivering the parts of a new edition of Bryan's 'Dictionary of Painters and Engravers,' quite double in size that of 1849. This firm states that the enormous sale of a cheap edition of E. P. Roe's 'Barriers Burned Away' increased, instead of diminishing, the sale of the bound copies. They will accordingly repeat the venture with his 'Opening a Chestnut Burr.' They have also in press 'Carola,' a new novel by Hesba Stretton. Finally, they promise at once 'El Mahdi and the Sudan,' by General Loring, formerly in the service of the Khedive.

'Euphorion,' studies of the antique and the mediæval in the Renaissance, by Vernon Lee, is among the spring announcements of T. Fisher Unwin, Paternoster Square, London.

W. R. Jenkins, 850 Sixth Avenue, has just published "Les Deux Écoliers," a one-act comedy by A. Laurent de Villeroy, of this city, who, himself a teacher, aims by it "à instruire sans fatiguer." For class-room use, every alternate page is blank and can receive the translation. Mr. Jenkins has nearly ready André Theuriet's 'Le Mariage de Gérard.'

Tuke's 'Influence of the Mind upon the Body' is not (partly in consequence of the author's style) a first-class work, but it has at the end of ten years reached a second London edition, and now a second American edition follows from the press of Henry C. Lea's Sons (Philadelphia). A glance through it shows the extensive overhauling that it has received, and the freshness of much of its new material, as in the sections devoted to the hallucinations of Lourdes and Knock.

Mr. Spofford's invaluable 'American Almanac' for the current year (American News Co.) preserves its familiar scheme, with the necessary alterations to date, and with the customary minor variations—omissions and additions. Such new features as we have been able to discover are the names of the Civil-Service Commission; the death-rate of our colored population in 1880, and their voting strength in the same year; library statistics; and suffrage qualifications, by States. The table of differences of time between New York and the chief cities of the Union is retained, but we miss an account of the new system of standard railroad time, which ought to become a standing feature of the Almanac. We will also repeat our wish that each new volume might contain an index to statistics given in preceding volumes exclusively. The public, we dare say, hardly appreciates the variety of the contents of this annual. Foreign countries as well as the United States are embraced in it.

The 'Statesman's Year-Book' for 1884 (Macmillan) has been so far worked over by its new editor, Mr. J. Scott Keltie, as to enable him to assume entire responsibility for it. It calls, therefore, for somewhat more extended criticism than formerly; and this we hope to give it shortly.

M. Louis Figuier's 'L'Année Scientifique et Industrielle' (F. W. Christern) depicts fairly well, in a light and popular way, the major doings of man and nature during the past year. No less than ten expositions—the last, "of insects"—are recorded, but invention seems to have added hardly anything remarkable or promising to the achievements of other years. We may perhaps except the application of electricity to the guidance of balloons, as attempted by MM. Gaston and Albert Tissandier; but, otherwise, those who were celebrating in August the centenary of the brothers Montgolfier could deny that the aeronautic art had made much progress since 1783. The earthquakes and eruptions, including Ischia and Krakatoa, were distinguished above any known to history. M. Figuier fails to notice the connection, which we may consider demonstrated, between the Javan disturbance and the extraordinary sunsets of the past few months. His section devoted to cyclones in this country is altogether inadequate. The cholera in Egypt, the political results of which we are now witnessing, was the chief plague. Nordenskiöld's expedition to Greenland was the most interesting and the most famous, but perhaps not the most valuable of the year. The Brooklyn Bridge was the greatest mechanical triumph. M. Figuier imports some little humor into his annals by telling of India-rubber crying babies invented in this country for use by railway travellers who want to deter others from invading their "wagon." And he jocosely says, of the ease with which dyspeptics use Dr. Faucher's siphon for washing out the stomach, that this operation becomes for them merely "une question de toilette."

Charles Scribner's Sons have added 'Doctor Johns' to the uniform series of Donald G. Mitchell's works; and volumes ii. and iii. of Dean Stanley's 'History of the Jewish Church' to the uniform series of his works.

The well-devised juvenile library called "Classics for Children," published by Ginn, Heath & Co, Boston, has just been enlarged by a new volume, 'Stories of the Old World,' by the Rev. Alfred J. Church. The story of the *Argo*, of Thebes, of Troy, of the wanderings of

Ulysses and of Æneas, is told in each case with Mr. Church's accustomed felicity.

It is a pleasure to receive the 'Vicar of Wakefield' in the garb of the "Parchment Library" (D. Appleton & Co.). Mr. Austin Dobson has annotated the story in a manner both agreeable and helpful, with very little that could be spared as contributing nothing to the elucidation of obscure passages, or to our knowledge of Goldsmith's mind and career. We mentioned last year Mr. Ford's very plausible theory of the scene of the story. This admirer has gone further in the illustration of Goldsmith, and, having shared his discoveries with Mr. Dobson, we have them here brought side by side with the text. It is safe to say, therefore, that no edition of the 'Vicar' is now to be preferred to this one.

The Bookmart Publishing Co., Pittsburgh, Pa , have published in a little pamphlet of eight pages a list of the prices obtained at the recent sale of the late Henry C. Murphy's library. It is fitted to bind up with the original catalogue, and will no doubt be thought by many book-buyers to be well worth the dollar that is charged for it.

Mr. Cable's 'Madame Delphine,' translated by Mme. Th. Bentzon, has just been published in Paris by Calmann Lévy. Mme. Blanc has recently, in the *Revue des Deux Mondes*, devoted two articles to Mr. Cable, which will probably reappear in her forthcoming volume on the 'New American Novelists.' 'Madame Delphine' is also announced by Mr. Douglas, of Edinburgh.

With No. 19, *Swinton's Story-Teller* ceased publication. The task of filling a weekly paper with short stories only is well-nigh hopeless, even if the past be drawn upon. Even *Fiction* lasted longer than the *Story-Teller*.

From Henry Cook, 110 Tremont Street, Boston, we have received probably the sole authentic memorial of the interment of the late Wendell Phillips in the old Granary burying-ground in Boston. The scene was photographed under such conditions of light as make the picture obtained a remarkable success, while much interest attaches, not only to the little family group in the foreground, but to the great sweep of headstones and other monuments which mark the resting-place of some of Boston's most famous sons. The price of the print is fifty cents.

Every owner of Hugo's folio, 'Bewick's Woodcuts' must have resented the unconcealed insertion of a great number of cuts which had no more relation to Bewick than to Albert Dürer or a prehistoric bone artist. Mr. W. J. Linton has been at pains, in the *Academy* of March 1, to analyze the entire lot of 2,009 cuts and pass judgment upon them. "Not a hint of Bewick," "Refuse again," "Nothing of any value," "May be by anybody," "By Bonner," "All by Green," are some of this expert's decisions, for which he certainly deserves thanks.

The *Antiquary* begins the new year with great promise; both the January and February numbers contain several papers of special interest. In the former, Mr. Henry B. Wheatley begins a series of articles upon "The History and Development of the House" (not continued in February). This instalment, besides an introduction, is devoted to the hall, and has four interesting illustrations from ancient sources (in English history). Mr. J. H. Round discusses the expression *illud detestabile bellum de Lewes*, found in a letter of Simon de Montfort, and undertakes to explain how the victor could call the battle "detestable." This he does by comparing it with the term "this unnatural war," used by Fairfax in a letter to Prince Rupert. The letter from America in 1774 has already been noticed by us. Interesting articles on the study of coins (by Reginald Stuart Poole), Fotheringay Castle, etc., we must pass over. The February number opens with an article by G. Laurence Gomme on the House of Lords. This, too, begins a series, and has for its object to establish Mr. Freeman's thesis that the Witenagemot, from which the House of Lords was derived, was itself the outgrowth of the popular assembly. Here we find taken for granted the view, generally given up now by the best German scholars, that the freeman had his political rights "by virtue of the lands he held in the common domain." A long article by Karl Blind on the "Hawick Slogan"—*Teribus ye Teri Odin*—brings a great mass of collateral learning to illustrate the question of the origin and meaning of this "ancient Germanic war-cry." He associates it with the old ceremony of the "Riding of the Marches." There is also an interesting article by Mr. Brownbill upon the early life of Thomas Cromwell, Earl of Essex. The writer takes an unfavorable view of Cromwell's political principles, which appear to have been modelled on 'The Prince' of Machiavelli.

In the last number of the English *Journal of Philology* the Master of Trinity has given a specimen of his *adversaria* on the well-worn "Clouds." "The chief motive for publishing them," he says, "was the desire to remind English scholars of the important textual services rendered to Aristophanes by their own countrymen, especially by Bentley; services which are, perhaps, better appreciated by the Dutch and some German critics than by our own students." Dr. Thompson's great reputation as a Grecian will of course secure attention for anything that he publishes, though it is hard for one not under the glamour of his authority to see the least earthly use in some of the notes, except to show that "the greatest Hellenist in England" is a careless proof-reader, which may be a comfort to those whom he has not spared—"some Germans" included. In Professor Nettleship's Notes in Latin Lexicography, we have some of the material which that indefatigable scholar is collecting for his great Latin dictionary. Mr. Scott has an interesting article on the "Physical Constitution of the Epicurean Gods"; and Malden's "Alexander in Afghanistan" has especial interest in view of the recent history of the country.

Mr. Maxwell Hall, of Jamaica, remarking that our knowledge of the planet Neptune is mostly confined to three points—that it is the furthest planet from the sun, appears as a star of the eighth magnitude, and is attended by a satellite—began in November last some observations, which were continued during the following month, and which indicate that (1) the planet has a delicate bluish color, and (2) that its brightness is subject to periodical variations, probably due to the rotation of the planet on its axis in 7h. 55m. 12s. He points out the remarkable prismatic sequence of color of the planets, proceeding from the earth outward—Mars reddish, Jupiter a delicate orange, Saturn greenish yellow, Uranus light green, and Neptune slightly blue. The extent of the observed variation in the brightness of Neptune amounted to nearly one stellar magnitude.

Dr. William Huggins has continued his important experiments in photographing the solar corona, without eclipse, during the past year. Through the kindness of the Misses Lassell, he was provided with a more suitable form of apparatus, made up in part of a seven-foot Newtonian telescope, constructed by the late Mr. Lassell. About fifty photographs were taken between April 2 and September 4, all of which show "a more or less coronal appearance," and the English members of the Caroline Island eclipse party of last May consider that "Dr. Huggins's coronas are certainly genuine as far as 8′ [one-fourth the sun's diameter] from the limb." A committee of the Royal Society has been appointed to arrange for taking photographs of the solar corona by Dr. Huggins's method, at some place of high elevation.

Two anonymous volumes, independent of but complementary to each other, bear the titles, 'Bismarck nach dem Kriege: ein Charakter- und Zeitbild,' and 'Bismarck: zwölf Jahre deutscher Politik (1871-1883).' The former was published last year and has gone through a second edition; the latter has just appeared in Germany. The author marks his identity by a sign of three asterisks on each title-page, and in the preface to the earlier volume acknowledges connections, of something like an "inspired" character and of long standing, with the political leader of the German Empire, whose consistency in actions and policies often apparently incongruous he endeavors to vindicate. These works are very interesting to students of contemporaneous history, chiefly on account of their many extracts from speeches, documents, and leading articles, which are ably connected and commented upon. The contents of the earlier volume are: "Bismarck and Rome," "Bismarck and Social Democracy," "Bismarck and the Joint-Stock Societies," "Bismarck and His Frictions," and "Bismarck and the [Parliamentary] Fractions"; and those of the new publication: "Bismarck, Gortchakoff, Andrássy," "Bismarck and the Central-European League of Peace," "Bismarck in External and Internal Affairs," "Bismarck and the French Policy of *Revanche*," and "Bismarck, Ultramontanism, and the Cobden Club."

Mr. Leonard Scott writes to us from Greensboro', N. C., to say that he has had nothing to do with the management of the "Leonard Scott Publishing Company" for the last eighteen years, and since 1881 has not even been a stockholder or interested in any way in the conduct of its affairs.

—Neat and timely is the little hand-book on 'Tree-Planting,' from the pen of Mr. N. H. Egleston, published by D. Appleton & Co. Excellent and convincing reasons are given in the first of the four short chapters why trees should be planted; and this is followed by suggestions about when to plant, what to plant, and how to plant. Mr. Egleston's advice upon these points is generally sensible and safe, and should have the effect of making people more closely examine for themselves this important subject. His views upon the possibility of covering the treeless plains of the central plateau of the continent with a forest growth are perhaps, however, a little more hopeful than circumstances quite justify. The flourishing plantations in the extreme western portion of Nebraska and Kansas, to which he alludes in support of his theory, exist, we fear, only in the glowing imagination of local editors, or enterprising railroad managers with lands to dispose of. In reality, so far at least as has come within our somewhat extended observations, all the plantations of trees which have been made west of the region of rainfall sufficient to insure a natural growth of trees have proved entire failures. It is, therefore, unfortunate that Mr. Egleston has found encouragement where encouragement does not exist, and that he has thus helped to keep up the delusion about the tree-growing capacity of the territory west of the 100th meridian. As he is an officer of the Government, however, it is perhaps only natural that he should suppose that trees can be made to grow, rain or no rain, so long as the Government continues to give away land for the purpose of encouraging the planting of timber without any regard whatever to the climatic conditions of the region to be planted. As long as the present Timber-Culture Act remains in

force, people will be seduced into the folly of needless expenditure in vain attempts to make trees grow where, except by the aid of irrigation, no human power can force them to do so.

—The copyright question has been discussed of late in the journals, daily, weekly, and monthly, from almost every point of view. But there is one way of looking at it which we do not remember to have seen noticed. Before granting the foreign author compensation, some persons who like to go to the bottom of things may ask whether the native has any right to that which he at present enjoys. Literary composition, they would point out, is a great pleasure. If an author is good for anything he enjoys writing. In fact, after he reaches a certain age and a certain degree of facility, there is scarcely any pleasure so great as the easy flow of ideas and words when he is in the vein. Why should he be paid for his amusement? It may be urged that he is not always in the vein, and that at such times writing is work and deserves pay. But why work when he is not in the mood? The product will not be good then. If he is to be paid, he has no right to palm off such work on the public; if he is not to be paid, he has no reason so to do. He may say that he cannot afford the delights of literary composition considered as a pastime; he must earn his living. Very well; let him do so by an honest trade, and deny himself this pleasure as men continually have to deny themselves a great many pleasures which are beyond their means. The claim that he deserves compensation for the phosphorus he consumes in writing has a similar answer. Why should he be paid for this outgo any more than the chess or the whist or the billiard player, who all of them use up their brains quite as much as the writer? Nor would it be allowed to be any better argument that authorship, even in its lightest forms, demands a long preliminary preparation, and that the honorarium, as the English are pleased to call it, may be regarded as interest on invested capital. So do all sports in which the pleasure comes from the successful exercise of skill. Does not the *Saturday Review* tell us that on those rare occasions when the English ponds and rivers are frozen thick, the most hard-worked business men are seen with their skates on at sunrise, and, while they are at it, lose no time in idling or fooling about it, but grind away at their figures with all the serious earnestness of students who are solving an astronomical problem or composing an epic poem? Yet no one thinks of paying them when they arrive at such proficiency that they can hold their own even with the cracks of the Canadian and American rinks. We present these considerations, not as representing our own views, but as contributing to round out the discussion. The other side hardly needs any statement. Our readers have no doubt already had in their minds the distinction between amateurs and "professionals"—those who play, write, or do anything else for pleasure, and those who do it for pay; have been asking themselves whether it is not fair that they should pay "gate money" in literature as well as in base-ball playing; and perhaps further, why the English actor or the German singer who comes over here and amuses or delights us, should get a recompense, and the English author whose books come over here, should get none.

—A work so admirable in plan and complete in execution as Kürschner's 'Litteratur-Kalender,' of which the sixth annual issue lies before us, must be indispensable to the literary men of Germany and highly useful to those of other countries. A similar work for English authors would perhaps be even more useful to us than this is to the Germans, but we fear there will never be sufficient *esprit de corps* among us to make possible such an undertaking. Mr. Kürschner's calendar is a 16mo of 488 pages, printed in the smallest, and therefore most unreadable, German type. Of the 488 pages, 303 are devoted to an alphabetical list of living German authors, each entry giving the name, principal works, date of birth, and—the most important thing—the post-office address. In the list are included professors and journalists, but, even with these, a foreigner is surprised to learn, great as is our respect for the intellectual activity of Germany, that the German literary profession numbers no fewer than 19,350 persons, of whom 18,142 have no other means of livelihood. Of the number first given, only 350 are women. To judge by some further statistics, the pecuniary reward is in inverse proportion to the number, since the 19,000 have families numbering 14,813 persons, but only 1,616 house-servants. The remaining pages are occupied with a necrology of 1883, lists of journals and publishers, the text of the French copyright treaty and a long legal opinion on copyright law, and reports, at considerable length, of various literary societies.

—That the advocates of a reform in German orthography are even more active than reformers of our own language is manifest from two publications on our table—*Reform*, the organ of the "Society for the Simplification of German Orthography," published monthly at Norden, (Prussia), and the annual 'Kalender des algemeinen fereins für fereinfachte deutsche rechtschreibung,' published by the Bremen branch society. The calendar is the sixth of its series, and *Reform* is in its eighth volume, although it seems that the society has only with the present year begun to make its organ accessible to the general public. The January number at first glance seems not what it is—that is to say, the leading article, stating the aims of the new movement, retains the old orthography, while the "practical part" is a sort of compromise between the old and the new, and only the "theoretical portion" (a very small one) shows the new method in its true colors. Briefly stated, its leading features are: but one written alphabet—the Roman; abolishment of capital letters, except in proper nouns and at the beginning of a sentence; no doubling of consonants in one syllable, and no letters to denote lengthened sounds; single signs for *ch* and *sch;* suppression of the superfluous *c*, *y*, *ph*, *sz*, *rh*, *x*, *w*, and *q;* *F* assumes the functions of *v*, which takes the place of *w*. The old rule, "Write as you correctly speak," is supposed to be the basis of the new orthography, which certainly in most respects recommends itself to native as well as foreign students of the German language. However, should the new method ever come to be generally accepted, it will be because the rule, "Write as you correctly speak," has been supplemented by the counter rule, "Speak as you correctly write." For the question, What is the correct way of speaking? meets us on looking at the commonest words in their new dress. Is "unt" and not "und" really the proper pronunciation, "hantlung" and not "handlung," "apsetzen" and not "absetzen"? (By the way, why setzen and not sezen?) Is no distinction to be made between "das" and "dass"? "Weksel" for "Wechsel" may be generally welcomed, but will "hökster" for "höchster" be? And who is to be our guide in the pronunciation of proper nouns, especially those belonging to foreign nations and to the past? Is it really necessary to introduce to the world, as the calendar does, in the "transition" spelling, a modernized "Oliwer Kromwel," a "Walter Skot," a "Moro"—the last all the stranger to the eye because Turenne and Béranger are preserved in their entirety? It would seem as if native names offered difficulties enough to German reformers, judging from the contradictory "Wircho" and "Basedow."

—There can no longer be any doubt that our continent owes its name to the German schoolmaster at St.-Dié, in Lorraine—Mr. Waldseemüller, or (in Greek) Hylacomylos, as he habitually called himself. We have been told repeatedly how his enthusiasm for Amerigo Vespucci's pretended discoveries was aroused by the young geographer Ringmann; we have heard how Waldseemüller, in his 'Cosmographiæ Introductio,' in the year 1507, spoke of a fourth continent, and added: "Why should we not call it the land of Amerigo or America, since it has been discovered by Amerigo?" and how Hylacomylos was thus the first who ever used the word "America." But not only is the inventor of the name of "America" a German, the word itself is radically German. "Amerigo" *may* be the Italian form of the German "Amalrîch," which we find as the name of a famous king of the Goths, and again in the 'Nibelungenlied' (st. 1488, etc.), and elsewhere; and in this case there would exist a close relation between the name of America and the name of the Swiss village of Amriswil (Amelricheswilare). While this is very probable, we may say *for certain* that the Italian "Amerigo" was considered, in the earliest remnants of German literature, as the equivalent of the German "Heinrich," "Heimrîch." One of the most celebrated bearers of this name was, for example, the Count of Narbonne, Amerigo II., who in the *chanson de geste Guillaume d'Orange* appears as Aymeri de Narbone. Wolfram von Eschenbach, one of the greatest poets of the German middle ages, bases his "Willehalm" on a part of the *chanson de geste* just mentioned, and says in the introduction to this poem:

> "Diz maere ist wâr, doch wunderlîch,
> *Von Narbôn grâf Heimrîch*
> Alle sîne süne verstiez," etc.

—In view of this equivalence, "Amerigo=Aymeri=Heimrîch," we might give the German form for America as "Heinricha" or "Heinzia," or, for people who like the still fashionable mixture of French and German, "Henrietta." Whether Amalrich or Heinrich be taken as the true equivalent of Amerigo, the latter is undoubtedly of German origin; and this fact cannot surprise any one who is acquainted with the history of the time when the German nation was the only great Power in the world, and when German proper names were used among all civilized nations. We might add that even in modern times the origin of the name of many a celebrated man outside of Germany is hardly disguised by its foreign dress—*e. g.*, Garibaldi is the German Garbald (Spear-bold); Umberto is the German Hunbert (Hun-bright, *i. e.*, Giant-bright); Leopardi is the German Leutwart (Folk-warder); and one of those German scholars who hear the grass grow has lately found out that the great French statesman Adolphe Thiers was of German descent, and properly ought to have written his name Adolf Dieterle!

—Few books of exploration present, in shape, print, maps, illustrations, and especially in their list of contents, as attractive an appearance as Karl Eugen von Ujfalvy's latest book of travel, 'Aus dem westlichen Himalaja,' published by Brockhaus in Leipzig (1884). The principal regions traversed by Ujfalvy in this his third Asiatic journey, begun in the spring of 1881, are those of northwestern India, Cashmere, Dardistan, and Little Thibet; and his range of observation embraces, besides anthropology, ethnology, archæology in the widest sense, and linguistics—his special branches of study—almost everything that engages the attention of a wide-awake traveller. In his second journey,

undertaken in 1880, he made an attempt to penetrate into the same regions from the north, through Russian Turkestan and across the Hindu Kush, but was prevented from achieving his object by unexpected obstacles. In his preface he remembers the late General Kaufmann, the then Russian Governor-General of Turkestan, with unmitigated contempt. Kaufmann probably treated Ujfalvy as a countryman of the Russophobist Vámbéry, although he travelled under the auspices of the French Government, being a French citizen, and, since 1871, a professor at the Lycée Henri IV. Ujfalvy is a Hungarian by descent and sentiment—and his name betrays him as such, especially when written out with its often misprinted complement "de Mezö-Kövesd"; but he was born in Vienna (in 1842), received a German education, and writes his works, which are equally numerous and important, not in Magyar but in French, or exceptionally in German, like the one before us. We followed the wording of the German title-page in giving his name above, but "Charles-Eugène de" would perhaps be more appropriate than "Karl Eugen von." The Magyar equivalent—Károly Jenö, without the particle indicative of nobility, which the termination of the family name renders superfluous—would have, according to the rules of the language, to be placed after "Ujfalvy." The explorer writes in a pleasant German style, remarkable for conciseness, and his volume is, for a work combining scientific discourse and amusing description, far from bulky. Throughout these travels, which were not without arduous labor or danger, he was accompanied by his wife. They brought home quite a museum of ethnological and artistic curiosities, which is alluded to with a kind of naïve self-congratulation. In his way of talking of his achievements, Ujfalvy frequently reminds one of Vámbéry, whom he, more patriotically than correctly, calls his "great countryman."

—An audience that occupied every seat in the Academy of Music and much of the standing room, assembled on Thursday to hear a performance by the Oratorio Society of Bach's great Passion Music according to St. Matthew. This fact is worthy of special attention, as it shows that people are getting over their superstitious dread of Bach, who has long been looked upon as a sort of abstruse musical Hegel. It cannot be denied that Bach often does give his hearers polyphonic puzzles to unravel. For the enjoyment of his music the mind must be in an active, not a passive state. One cannot sit down and lazily indulge in it as one does in an Italian aria or a hot bath. It is more like swimming against a mountain stream, and the subsequent effect is equally exhilarating, as compared with the languid feeling that follows a hot bath. Those who do follow Bach in an attentive manner and understand all his subtle processes, cannot save themselves from the fate of becoming enthusiasts. The singers who are obliged to study his music all become affected in this way, and with the audiences it is only a question of time and repetition. When Beethoven, toward the end of his life, became acquainted with the exhumed vocal treasures of Bach he exclaimed, "Not Bach (brook), but Ocean should be his name"; so inexhaustible are his musical resources and so profound his originality. Bach has exerted an enormous influence on all modern composers—especially on Schumann, Franz, Saint-Saëns, and Wagner; and it is to a large extent the light reflected from their works that makes Bach more and more intelligible to us It is to be hoped that the time is at hand when we shall have an annual performance in this city not only of the St. Matthew's Passion, but of the sublime B minor Mass and others of Bach's works. Of the five Passions which he is supposed to have written, the one according to St. Matthew, which was given last week, is justly considered the best; but the one according to St. John is almost equal to it in beauty, and by no means deserves the neglect which is its lot even in North Germany. In these Passions it is not easy to say what deserves the most admiration—the majestic chorales, which were originally intended to be sung by the congregation; the expressive recitatives; the quaint and beautiful orchestral part; the chaste and simple solo melodies, or the highly dramatic and wonderfully constructed choruses. No composer has ever written more charming violin or oboe obligatos than those which were on Thursday assigned to two members of the orchestra, and the final chorus of the work is of an inspiring grandeur that has never since been equalled except in the third act of "Die Meistersinger." The performance was meritorious, considering the difficulty of the task. In accordance with a request on the programme, applause was abstained from, which added much to the dignity and impressiveness of the concert.

LEA'S SACERDOTAL CELIBACY.

Historical Sketch of Sacerdotal Celibacy in the Christian Church. By Henry C. Lea. 2d ed. Boston: Houghton, Mifflin & Co.

AFTER an interval of seventeen years the second edition of Mr. Lea's unique volume is offered to the public. It differs from the earlier one mainly in the addition of material in the chapters upon the Church of to-day, bringing the account down to its latest phase in the establishment of civil marriage and the attempt to rescue education from the hands of a celibate clergy.

The author has become well known to students of mediæval, and especially of ecclesiastical, history by his vigorous and scholarly investigation in these fields. His manner of working is to select some one narrow topic, and to pursue this through all the phases of its origin, development, and, perhaps, decline. This is a method which has great advantages, but also great dangers. It serves to hold more firmly before the mind of the author and, therefore, of the reader the one aspect of human life which is under consideration, whereas in more general works it becomes often impossible to bring out clearly such a story of development, and the reader is left in doubt and confusion on the very points he would especially like to be clear about. Monographic writing, if well done, forms the necessary complement to more general study. But, on the other hand, there is danger that the author's mind, becoming completely filled with the narrow subject he has chosen, may lose the power of seeing its wider relations and of rightly estimating its value as a factor in the history of its time.

The book before us illustrates often the advantages and rarely the dangers of the historical monograph. It is the result of a vast amount of patient labor, of endless reading in almost the whole range of Church history, directed to the single object of showing how the institution of priestly celibacy grew, culminated, and declined. It was, moreover, work in an almost unbroken field, for the unwieldly volumes of the brothers Theiner were, so far as we know, the only attempt of modern scholarship to deal with the subject. This mass of material Mr. Lea has not only read and noted, but digested; so that what might easily have degenerated into an unreadable jumble of scattered notes appears as a well-ordered whole, so carefully arranged in its divisions that one has little difficulty in holding the thread of the narrative. Nor has he forgotten that the institution he is describing does not stand alone, but is only one manifestation of a grandly conceived and powerfully executed plan to build up throughout the Christian world a government of a priesthood which should claim for itself the unquestioning allegiance of mankind. The Roman argument that what is, always has been (only, perhaps, in some modified form), is sufficient to prop up its most absurd pretensions in the minds of a vast majority among the persons it addresses. It can be met only as Luther met it, by showing from the plain evidence of history that the argument is a mere assumption, and false at that. History has been telling more and more plainly now these many years that all institutions are but growths, developing and ripening as the times need; and further, that only in so far as institutions rest upon this demand can they hope for permanence and vigor. If any proof were wanting as to the value of this historic method, the mass of lies cast into the form of history and circulated by the Roman Church as its best defence, would abundantly supply it. Herein consists the great value of Mr. Lea's work. It moves on in a line of evidence so closely twisted, it draws so plainly the distinction between temporary usefulness and divine inspiration, that any who will may follow the claims to the essential character of priestly celibacy, and see how wide is the distance from the fact to the dogma.

Celibacy originated in the Christian Church as it has originated in many another church, from purely natural and easily discernible causes. Though many of the aspects of early Christian monachism remind one of the older systems of the East, we doubt whether Mr. Lea has not gone too far in supposing a direct connection between them. Is it not enough to think, in the absence of direct evidence, that the earliest forms of Christian asceticism arose from a simple and natural desire after the higher life, and the mistaken fancy that all physical life, not to say all physical indulgence, was a thing lower and therefore less worthy than the life of the spirit? The step from this notion to that of the incompatibility of the two was a natural and easy one. The less of the physical or temporal, the more of the spiritual or eternal. Once started, this idea could hardly fail to grow vigorously in the favoring soil of the Eastern Church. The expressions of opinion in favor of celibacy, if the person were inclined to it and capable of maintaining it, are almost as old as the Church itself. But it is long before anything like a prohibition of marriage among clergymen can be found. Even when these appear, they touch first upon second marriages, and only later come to the real issue. The conspicuous silence of the Council of Nicæa, well established by Mr. Lea in a vigorous chapter, proves the slight importance of the doctrine at that day. Not until late in the fourth century do we find regular and general decrees against priestly marriage. But even then it is clear that such decrees were not supported by the general feeling of Christendom. One cannot but be impressed with the revolt of sound human nature against this unnatural attempt. In spite of repeated decrees, the priest remained a man.

A powerful impulse was given to the cause of celibacy by the establishment in the sixth century of the Benedictine order. The rapid growth of monasticism in the West brought out a new rivalry between regular and secular clergy. In self-defence the latter were compelled to emulate the ascetic rigor of the former. However the priests themselves might resist, it was clear that the common people were generally deeply impressed by the superior sanctity of the monk. The priest, then, must show him-

self capable of the same restraint to be worthy of the same allegiance.

But soon priest and monk alike began to prove the inherent falseness of the principle they affected to maintain. Corruption crept into the monasteries, and made necessary reform after reform. Indeed, the establishment of new orders had hardly any other meaning than this, that the old orders had departed from their purity and needed to be reinforced by more vigorous blood. So it was with the priesthood. Popes, synods, temporal sovereigns, combined in vain in a great effort at reform. What had been but a violation of discipline was branded as heresy, and, with a singular reversion to what had been itself, ever since the Donatist revolt, regarded as heretical, the Church declared the married priest incapable of conveying to the layman the mystic benefit of the sacraments. The priest who kept a harem of concubines was simply guilty of a venial sin, which did not vitiate his act as priest; it was the act of marriage, with its more deliberate declaration of principle, which the Church could not tolerate.

The reasons for this attitude of the Church are thoroughly grasped and well described by Mr. Lea. It was not merely the critical sentiment as to the purity of the priest that urged Hildebrand to action. He saw, with his keen statesman's eye, the whole breadth of the danger which threatened if benefices were to become the property of priests and to be transferred by inheritance to their sons. If benefices were first to be bought, and then used as a means of equipping sons or portioning daughters—as was in fact often done—then there was an end to the whole conception of the Church as made up of men who owed their place and their power solely to their sacramental consecration. It was this clear conception of the evil which gave its force to the assault of Gregory VII., and his work forms naturally the culminating point of Mr. Lea's recital.

The greatest difficulty in getting at the truth on the whole subject is in the fact that almost all the material is buried in the writings of orthodox churchmen. The individuals and sects opposed to the institution of celibacy have left so little written evidence that they have hardly a word to answer to the charges of immorality and of heresy heaped upon them by their notorious enemies. But for this very reason such scraps of evidence as can be gathered from the voluminous literature of persecution have a value doubly great. Such a word as that of Damiani, for instance, that the Lombard clergy, excepting for their damning sin of marriage, were as angels of light in a corrupt age, may well outweigh volumes of anathema. And the same might be said of the ghastly calendar of unspeakable monastic crimes which Damiani presented to Pope Leo IX. as a spur to his reforming energy, without the shadow of an idea that these evils were a part of the monastic system, and not merely a laxity which stricter discipline might remove. Such bits of unconscious testimony as these reveal a state of mind so utterly different from our own, a conception of right and wrong so confused and so inadequate, that one must feel a positive debt of gratitude to the author who has been able to bring some light and order out of this chaos of religious, political, and social ideas.

From the time of Hildebrand it is not too much to say that no change takes place in the question of celibacy. More and more the conviction grew that it was essential to the true life of the Church, but, almost in proportion to the theoretical abandonment of marriage, other forms of sexual indulgence came to be regarded as the privilege of the priest, until, in the hideous comedy of a Borgian papacy, every veil of decency was cast aside. Perhaps in no respect does the Catholic Church owe a larger debt to the Protestant Reformation than in this. Placed upon its defence, it has been forced to a standard of morality higher than its own. In just the proportion that the Roman Church is subject to this pressure from without, it can maintain its artificial standard of virtue. Just so far as it becomes dominant, it will find this standard ineffectual to save it from the deeps of degrading vice.

SEELEY'S WALPOLE.

Horace Walpole and His World. Select Passages from His Letters. Edited by L. B. Seeley, M. A. With eight illustrations after Sir Joshua Reynolds and Sir Thomas Lawrence. Scribner & Welford. 1884.

WHETHER Horace Walpole had in fact the soul of a gentleman-usher, as Macaulay sneeringly wrote, and as he himself lightly suggested might have been the case in his state of preëxistence, he certainly fills the office of one to posterity. He was the principal chronicler of fashionable society in the latter half of his century, and he introduces his lords and ladies with a suavity unusual in English diarists, and with an air and an enjoyment quite professional. The company itself was very agreeable. True, it was not literature alone that had so declined in those days as to justify a cold regard such as he expressed for it—"Don't tell me I am grown old and peevish and supercilious—name the geniuses of 1774, and I submit." Society, too, had degenerated. That century was the fl wering time of the aristocracy; but, when Walpole wrote his multitudinous letters, the prime had passed. In the earlier hour, in Peterborough and Ormond, Bolingbroke, Pulteney, and Carteret, there had been a nobler manner and a finer intelligence. The world of Horace Walpole was bent only on enjoying itself mostly in the frivolous way that was the habit of the more decent portion of society to which his attention is confined; Fox's habits are mentioned only to be deplored, Queensbury is just heard of, Grafton is not named. Here are misses who dance, dowagers who play loo, and gentlemen—but really next to none of that sex can be found in Walpole's work as set forth by the present editor. The set he moved in, it would seem, was distinctly feminine, notwithstanding the fact that he had a poet and an antiquary, as well as men of affairs and fashion, among his correspondents. Indeed, Walpole's intellects could not be compressed within the narrow interests of his social clique—he was a larger man than most of those he knew; and Mr. Seeley, in confining his extracts from the vast correspondence almost exclusively to the topics of high life, and then labelling a confraternity of old women and young girls "Horace Walpole's world," has made a grave error in the perspective of his hero's life. The indefatigable scribbler, who was besides a voluminous author, not only meant to intrust his fame to this body of letters as his chief hope of immortality, but also took pains to select his correspondents, like characters for a play, with a regard to their grouping and function. Sir Horace Mann was his politician, Mason his littérateur, etc. In Mr. Seeley's volume, unfortunately, the letters are mostly of the sort their author called newspapers of London gossip, and all others are subordinated. The consequence is that he really wears somewhat more closely than he deserves the character of the gentleman-usher with which he has been reproached.

Horace Walpole was, however, preëminently a man of society. He had been well taken care of, at the public expense, by his father, before Sir Robert went out of office, and was therefore (being, moreover, a bachelor) always free from pecuniary trouble, and eventually became wealthy. He was unable to hunt, unwilling to gamble, uninured to getting drunk, and consequently had spirits for some intellectual pursuits and leisure to follow them. He built his castle at Strawberry Hill, and, being one of the most restless virtuosos of his age, filled it with curiosities and made it one of the wonders of England—a shrine for holiday visitors, native and foreign. He was distinguished, too, by many characteristic tastes of the ruling mode. He liked a broad landscape, spotted with gardens and arbors, with stretches of lawn and river, diversified by moving objects. "A park wall," he writes, "with ivy on it and fern near it, and a back parlor in London in summer, with a dead creeper and a couple of sooty sparrows, are my strongest ideas of melancholy solitude." He was sufficiently sensible, however, to protest against the absurdity of attempting the pastoral life, by way of amusement, even in the greenest of the Thames's meadows—the Elysian fields at Stowe:

"I could not help laughing as I surveyed our troop, which, instead of tripping lightly to such an Arcadian entertainment, were hobbling down by the balustrades, wrapped up in cloaks and greatcoats, for fear of catching cold. The Earl, you know, is bent double—the Countess very lame; I am a miserable walker, and the Princess, though as strong as a Brunswick lion, makes no figure in going down fifty stone stairs. Except Lady Anne, and by courtesy Lady Mary, we were none of us young enough for a pastoral. We supped in the grotto, which is as proper to this climate as a sea-coal fire would be in the dog-days at Tivoli."

This gives one a sympathetic shiver, remembering modern attempts at the *al fresco* in our own country-seats; but the law and gospel of our climate is promulgated elsewhere, in a passage that affords a vivid outlook on the gradual change which was then already beginning to convert the old England into the seemingly endless park and garden it has in many districts now become:

"Our poets learnt their trade of the Romans, and so adopted the terms of their masters. They talk of shady groves, purling streams, and cooling breezes, and we get sore throats and agues with attempting to realize their visions. Master Damon writes a song and invites Miss Chloe to enjoy the cool of the evening, and never a bit have we of any such thing as a cool evening. Zephyr is a northeast wind, that makes Damon button up his chin, and pinches Chloe's nose till it is red and blue; and then they cry, *This is a bad summer!* as if we ever had any other. The best sun we have is made of Newcastle coal, and I am determined never to reckon upon any other. We ruin ourselves with inviting over foreign trees, and making our houses clamber up hills to look at prospects. How our ancestors would laugh at us, who knew there was no being comfortable unless you had a high hill before your nose, and a thick, warm wood at your back. Taste is too freezing a commodity for us, and, depend upon it, will go out of fashion again."

The grottos, and gardens, and pastorals have indeed gone out of fashion with the poets to whom they furnished their stock of nature; but the pretty prospects and the cultivated plots, which then only bordered a few miles of the Thames, have now spread over the island, and are a sign that the England of Walpole has well-nigh passed away. Change has not been confined to the face of the English landscape. Accustomed as we are to think that there is an extraordinary gulf between the French republic and the *ancienne noblesse*, modern England is nevertheless really quite as remote from the aristocracy of which this gentleman of mingled town taste and home-bred sense was once a dilettante. Then, as he relates, the mob would follow the beautiful Gunning sisters in crowds, and pleased itself with making the quality stop their coaches and unmask on the way to the great subscrip-

tion ball which the House of Commons had adjourned to attend. Occasionally a Lord George Gordon riot might alarm the capital, but, like the shock of the earthquake he ridiculed, it would only wake the nobility to make falling to sleep again more comfortable. Robbery on the highway was very common even under the windows of the palace, and the ladies who ventured out to see one another after dusk went well enough armed, in his phrase, to capture Gibraltar.

These things are commonly known as history, but in Walpole's pages they are still acting, and have the character of adventure. Within his own day there were some changes that seemed to him great, but political rather than social, unless among the latter be reckoned the gradual postponement of the dinner hour from 5 o'clock, and the encroachment of the evening on the morning, which prompts him to say he "has outlived daylight." He saw, for example, the rebel lords of '45 beheaded, and made a fine letter out of the scene, and he lived until after the widow of the Pretender was presented to the Hanoverian Queen at court. If the angels have any sense of humor, he remarks, men must make them excellent sport. They—the changeable mortals—do not play fewer tricks before high heaven in the present time; but there have been so many reforms in the last hundred years that Horace might now be greatly shocked at the revolution of which he felt the premonitions. His occupation as newsmonger for the ladies and historiographer for generations unborn, would be gone, as well as the profitable sinecures that rained money into his purse. There would be no more frolics of bold young ladies and rakish youth at Ranelagh, no highwaymen, no Madame du Deffand, and (we greatly fear, at the present price of bric-à-brac) no curiosity shop at Strawberry Hill. The nobler qualities of Walpole's character, consequently (for we always instinctively judge our grandfathers by our own ideals), need to be insisted on if he is to have any respect. One must momentarily forget that he was a reporter of small affairs, a collector of rarities, a Platonic friend of old *mesdames*, and adoptive uncle of pretty girls, and especially that financially and politically he was an intolerable and crying abuse. Then it can be remembered that he helped to revive the taste for Gothic architecture, inaugurated a new (though bad) school of fiction, was the friend of America throughout her troubles, and denounced the slave-trade before Wilberforce was born. His life, fussy as much of it was, had a window or two open on the future; and though he tittle-tattled a good deal, and in particular was liable to that unfortunate misconstruction which a very virtuous gallant with a very white face is always subject to, though, in fact, he was exposed to contempt, and did much in an old-womanish way to deserve it, he certainly wrote very entertaining letters.

These letters have always ranked high since Byron and Scott said they were classic. They are excellently written, and when the subject is good they are delightful, being vivid, amiable, quick, seasoned with allusion, point, and anecdote. But whether they will keep their rank may be questioned. This selection does not do them justice: the editor has given a picture of the times, not characteristic letters of Walpole for their own sake. Those times were very entertaining to Scott and Byron, who lived near them and were aristocrats by taste; but to the world they are the least interesting of English history, and Walpole's associates played but little parts on the stage. "The world he lived in," as the editor calls it, will assuredly grow less attractive. Even now Selwyn and Queensbury are nearly as dead as Sedley and Rochester of a hundred years before; and can the beautiful baby faces in these portraits outlive the finished gallant and the notorious debauchee? Why, Walpole's "world" was commonplace in its own day. The defect in these letters, as classical compositions, is their lack of freshness. They are a chronicle of faded things—finery, ambitions, sentiments, gossip, criticisms, beaux, dames, and nephews, all musty, and dry, and rubbishy. They do not reveal a nature like Cowper's, nor treasure up refinement, sense, and scholarly associations like Gray's. Invaluable to the historian, and to lovers of old French memoirs, they are not classic in the sense that Cowper's and Gray's letters are—in the sense of being invaluable to the highly-cultivated man. So far as the society they picture is concerned, the candles were burnt out and the play was done long ago. They are the quintessential spirit of worldliness—the form and feature of the world of which it was anciently said the fashion of it passeth away. They belong to the antiquary; they no longer touch life.

TEXT-BOOKS FOR LATIN.

Latin Grammar and Junior Scholarship Papers. By the Rev. J. H. Raven, M.A. London: Rivingtons. 1883.

T. Macci Plauti Trinummus. With Notes and Introduction. By C. E. Freeman, M.A., and the Rev. A. Sloman, M.A. Oxford: Clarendon Press. 1883.

A First Latin Book. By D. Y. Comstock, A.M. Boston: John Allyn. 1883.

The Greater Poems of Virgil. Vol. II. Containing the last six books of the Æneid and the Georgics. By J. B. Greenough. Boston: Ginn, Heath & Co. 1884.

Livy, Books XXI.–XXV. The Second Punic War. Translated into English with Notes. By Alfred John Church, M.A., and William Jackson Brodribb, M.A. With maps. London and New York: Macmillan & Co. 1883.

Cicero de Officiis. Translated, with an Introduction and Notes, by Andrew P. Peabody. Boston: Little, Brown & Co. 1883.

The Annals of Tacitus. Edited, with Introduction and Notes, by Henry Furneaux, M.A. Vol. I. Books I.–VI. Oxford: Clarendon Press. 1884.

We have on our table a collection of text-books for Latin, from American and English editors, which have been accumulating for some time, and can in most cases receive but cursory notice. Mr. Raven's is a neat little book, and will furnish useful material to teachers for questions in practical drill; but the words "Latin Grammar" must be construed much more widely than is customary in American schools. A large number of the questions are in translation from English into Latin and *vice versa*, or on the calendar, coinage, etc., in those parts of a grammar which boys read when they do not feel like getting lessons in it. Messrs. Freeman and Sloman's 'Trinummus' gives this favorite play of Plautus in an excellent form for college use. It is of course based on Ritschl and Brix, as every new edition of Plautus for some time will have to be. There are copious stage directions, founded on the experience of the actual presentation of the play at Westminster School, a performance which, we can testify from personal experience, will light up the "Trinummus" wonderfully even for those who read it under the Pope Professor at Harvard College.

Professor Greenough's edition of the last six books of the Æneid and of the Georgics of Virgil has the fault that all second volumes and last parts of school editions have: the notes are far too meagre. These poems are among the very hardest Latin there is, although the old absurdity of reading the Georgics in preparation for college, instead of putting them in the sophomore or junior year, still rules in some of our institutions. It is to us inconceivable that Mr. Greenough should take a pupil through Turnus's defiance in the ninth book, or Evander's or Diomedes's speeches in the eleventh, without ten times as much explanation as he here puts into his notes. The fact is, a large part of his notes to these books, as well as to the other portion, seem rather the points that have struck him as interesting in his private study than those needed to help a class.

The plan of Mr. Comstock's 'First Latin Book' is avowedly different from that of most primary manuals. He considers them too meagre, and believes that on beginning a language there should be accessible a full explanation of all difficulties likely to arise. His book is thus composed of an introductory treatise on general or English grammar, a very full Latin accidence and syntax, and abundant exercises in writing and translation founded on the first book of Cæsar, with notes and a vocabulary. In our opinion its elaborateness makes it likely to be a perplexing book for beginners; and it is further complicated by references to several of the grammars most in use in our classical schools. This, though a common practice, we cannot help thinking a mistaken one: a book for beginners should be capable of the fullest use, without reference to any other manual, however popular.

Messrs. Church and Brodribb are well known as editors and translators of Tacitus. They give us here the first half of Livy's third decade in English, with notes and excursuses on the relations of Rome and Carthage, Livy, Hannibal's character, his passage of the Alps, and Syracuse. This translation is much more likely to be used as a labor-saving machine by those to whom the labor is useful, than to give an idea of the author to those who make no pretence at Latin. For both it seems to us to have the same disadvantages—mainly a want of simplicity. There is an affectation of raciness in the vocabulary which is very unlike Livy, and at the same time his periodic and interlocked sentences might be broken up far more than they are, and the antithesis in many cases better indicated. The whole work seems to be that of bookmakers.

Dr. Peabody's translation of 'Cicero de Officiis' is distinctly a labor of love. He may truly say of it what Cicero said of all books: "Hæc studia nobiscum peregrinantur"—Tully has been his travelling companion for years. Cicero is, beyond doubt, the most modern of the ancients, and his work on Duties is the best summary of the ancient morality in theory, just before its utter dissolution in practice. At a time when summer philosophers are talking about ancient thought decidedly beyond knowledge, Dr. Peabody comes forward to present this standard and most readable treatise in English—English for the general reader, neither the schoolboy nor the scholar. His preface, on ancient ethical theories in general, is very sound; and he concludes it, in explanation of his own principles of translation, with a very shrewd remark on the use of particles in Latin and Greek. Written as these languages were in letters of one size, without division of words, and very few stops, he shows that the particles are frequently recurring catchwords, meant for the eye, and only a disfigurement in English translation.

Mr. Furneaux's 'Tacitus' is a truly magnificent book, and the examination that we have been able to give it indicates that it is as thorough as it is handsome. The first six books of Tacitus's

'Annals,' derived from a single very corrupt and broken MS., are second to no Latin classic in interest for the most casual reader, and in perplexing problems for the scholar. The editor begins by an introduction divided into nine chapters, five relating to the genuineness of the work, and the style and temper of the author, and four to the constitution of the early Empire and the condition of the Imperial household. A large part of these essays are of course merely compilation of what has been before noted, but they exhibit great judgment in collecting and arranging, and an entire independence of thought in their massing, instead of that weak worship of the "last German" so common in Western editions. But those essays in which erudition is a secondary, and judgment a primary matter, show that Mr. Furneaux has really taken hold of the Tacitean problems and thought out his own solution, in a way very unusual with recent editors. We commend Essays VII., "On the general administration of the Roman world," and VIII., "On the character of Tiberius," as illustrating his skill in grouping facts and drawing inferences. The notes which follow are in the main exegetical. The introductory essays, especially that on style, are liberally referred to, and no point of interest is neglected. Unlike most English editors, Mr. Furneaux makes but sparing use of translation to explain hard points, and is much more liberal of analytical sentences; nor does he, as far as we have been able to see, deal in that affected scouring of the English language in all its ages to express the Latin by some very precise equivalents, which no writer would ever use now. The whole volume appears to us scholarly, practical, and dignified—worthy of Oxford and of Tacitus.

Unser Reichskanzler: Studien zu einem Charakterbilde. Von Moritz Busch. Leipzig: F. W. Grunow; New York: B. Westermann & Co. 2 vols., 454, 438. 1884.

Dr. Busch's new book on Bismarck will hardly rival his former one in popularity. Its aim is professedly to furnish the materials for a complete portrait of the German Chancellor, but instead of furnishing anything new it only collects what was already easily accessible in print. Each of its twelve chapters is devoted to throwing light upon some particular phase of Bismarck's career and character: thus, one treats of his religious views, another of his treatment of the French, another of his attitude towards Austria; one regards him as an orator and humorist, another in his family relations, and so on. The method pursued is to give extracts from his speeches and letters, interspersed with comments, disquisitions, and explanations, without omitting copious passages from the author's previous book. Indeed, so far is Dr. Busch from hesitating to repeat himself that in this work he prints many things twice, some of which he had himself published before. To give but a single instance: on page 271 of the first volume and on page 99 of the second volume the reader finds the same identical story of how Bismarck threatened Thiers with a restoration of Napoleon III. if the demands of Germany were not complied with. When it is added that there are other superfluities (such as disquisitions on diplomatic abuses and on the communistic agitation) which have no bearing on the subject, it ceases to surprise us that what purports to be a mere "sketch" should assume the appalling proportions of nearly a thousand pages, destitute of an index.

Nevertheless, although lacking the charm of novelty to which the book on 'Bismarck and His People' owed so much of its great success, and although Bismarck has laid himself open to much criticism during the past five or six years, and has diminished the number of his ardent admirers, the present work is by no means devoid of interest. It is an adroit vindication of Bismarck's course and integrity from every aspersion. The extracts from his public utterances are skilfully collated so as to demonstrate his unfailing patriotism and sagacity, and his superiority at all times to his political opponents. The latter are taunted, more than once, with intimations of what would have happened to Germany if, at various critical periods during the past thirty years, their views had prevailed, as contrasted with the actual results of Bismarck's policy. It is, after all, in these results that the statesman will find his real vindication, and by its results also must his more recent policy be ultimately judged.

Distant observers who are disposed to do full justice to his great achievements, but who consider his economic and socialistic legislation a blunder, may find a solution of the enigma in Matthew Arnold's dictum concerning the qualities and the defects of an aristocracy. Bismarck is by birth, by education, by character, and by conviction an aristocrat. Before being a German he is a Prussian, and as a Prussian he is a faithful servitor of the house of Hohenzollern. A united Germany under the hegemony of Prussia, a monarchy in which the King not only reigns but also governs—these are the ideals which he has kept steadily in view and has realized. For parliamentary government he entertains a supreme contempt. While he admits that in England, where it has gradually grown with the growth of the nation and has been favored by the insular situation, it works reasonably well, he believes that on the European Continent it is bound to lead to republicanism, which to him is synonymous with anarchy. In home matters he plants himself squarely on the Prussian Constitution, which guarantees coördinate powers to the three branches of the Government as far as legislation is concerned, but concentrates the executive power in the hands of the King. That a court of law should be allowed to decide a question of constitutionality is to him a horrible absurdity. Government by parties he pronounces an impossibility in Germany because each party always tends to develop in the direction of its extremest wings. For himself, he says, he belongs to no party. His only guide is the public good—*salus publica*. Whatever party will coöperate with him for the welfare of the country he welcomes as a help, and when their roads diverge he seeks a new alliance. In 1873, when a more stringent press law was opposed by Lasker as being an invasion of the rights of the people, Bismarck replied: "We are all of us representatives of the people. I belong to the people, we all belong to the people, as well as the gentlemen who call themselves Liberals. I deny that there is any antagonism between the people and the Government." He is a firm believer in discipline, even in matters of diplomacy. The foreign ambassadors, he says, must file right or left, at the word of command, as if they were sergeants.

Although containing little or nothing that is absolutely new, the present work states a few things which are not generally known. One is that what actually led Bismarck to join in the *Kulturkampf* against the Vatican was not the Italian but the Polish question. The Roman Church brought the conflict on itself by the zeal with which it labored to foster the Polish elements and repress the Germans in Silesia, and the Government was compelled to resort to energetic measures to counteract this injurious tendency. Again, we are told that in 1878 Marshal MacMahon was extremely desirous that Germany should be represented at the Paris Exposition, and although the Empress was in favor of the proposal, Bismarck succeeded in having it rejected. His reasons were that the German exhibitors would be exposed to all manner of dangers and insults, which might ultimately lead to international complications and disturbances. There is, further, a long and interesting extract from a speech in which Bismarck gave an account of his intercourse with Lassalle, whom he calls one of the most amiable and intelligent men he ever met. "Lassalle was an energetic and highly intellectual man, with whom it was very instructive to converse. Our interviews lasted for hours, and I always viewed their termination with regret."

The extracts from the Chancellor's speeches evidence a familiarity not only with German and French, but also with English literature, even in its minor productions, and, although the world has never regarded him as an orator, his utterances have a vigorous homely air of common-sense more effective than the most labored rhetoric. The closing chapter gives an interesting account of Bismarck's powers as an athlete, of his proficiency in all manly exercises, of his good fortune as a hunter and sportsman, of his fondness for a country life, and of his success in farming his estates. If we are to believe the author, a simple idyllic existence, such as Pope depicts, is more to the taste of the Prince than an active political career; but even the most docile reader will refuse to honor so huge a draft on his credulity.

Italian Masters in German Galleries: a Critical Essay on the Italian Pictures in the Galleries of Munich, Dresden, Berlin. By Giovanni Morelli, Member of the Italian Senate. Translated from the German by Mrs. Louise M. Richter. London: George Bell & Sons.

Art criticism divides itself broadly into two branches—archæologic and æsthetic. The latter is an affair of sympathy with the artist's faculty of comprehending his purpose and of measuring his success in attaining it, and demands for its outfit a certain knowledge of the facts of nature and the laws of art, with a sufficient practical acquaintance with methods and processes to enable the critic to follow the artist through his work, and to judge of his success and the difficulties overcome in reaching it. The former is a matter of science, but science followed with a fine discrimination in the facts which form the foundation of it. This does not involve the capacity to pronounce judgment on the relative merits of an artist, or of works of art; it deals only with authenticity, with historical and chronological relations, and the lines of development of art and the schools of art. The capacity of the critic in one of these branches does not in the least imply his equal ability in the other. On the contrary, it can rarely happen that the man endowed with the scientific temper necessary for success in the archæology of art, and for patient collation of the requisite data, and with the impartial estimation of all painters and all schools which he must possess, will also have that degree of sympathy with the art of his time, and above all with new and yet unplaced art, which makes his criticism of it of distinct value. The union of high eminence in both branches is as unlikely as the analogous union in the same person of great scientific attainments and poetical excellence. There is no impossibility in the æsthetic critic acquiring the knowledge embraced in the archæology of art; but it is exceedingly improbable that the temper which fits him for one function would permit him to prepare himself for the other. At

all events, there is, so far as we know, no case on record of distinguished eminence of the same person in both branches, nor is there the least utility in such a combination. The æsthetic critic has to deal with new matter, and the ability to place it properly and with absolute justice depends on his freedom from prepossession and prejudice. He must measure Michael Angelo as if an unknown man, or how can he detect the yet unknown Michael Angelo? The passionate reverence of the hierarchy of art which makes its study a labor of love, is inconsistent with the free-thinking and radical temper of the critic, who must, if possible, ignore the weight of all tradition and the pressure of all authority, maintain the right of individual judgment, and measure Millet and Michael Angelo by the same standard. Even if the two so diverse qualifications should be united in one individual, there would not appear to be any gain—the law of specialties, indeed, indicating the advantage of their separation.

It is thus easy to understand why the Germans, so profound in their science and so patient and exhaustive in research, are so utterly inadequate in æsthetic criticism, narrow in judgment, bound up in conventionalities, and provincial, in what pertains to contemporary art; while the fact that an Italian critic, Senator Morelli, has been able to attack them successfully on their own ground, may possibly be, in part at least, due to his thorough acquaintance with and employment of German methods and research. His book—written in German, that those whom he virtually attacks might lose none of the force of his distinctions—is a model of archæological criticism; and although, unfortunately, limited to examination of the great German galleries, will leave an ardent hope in the mind of the reader that he may one day pass the great English, French, and Italian galleries through the same ordeal. The book is so compact and terse in its reasoning and collation of data, so exhaustive in its investigation of the material obtainable, that we admit without hesitation the claim of the author to have examined every picture accessible; and the minuteness and excellent method of his investigation, shown on every page of the book, carry conviction with them. His sarcastic deference to those arch-bunglers, Crowe and Cavalcaselle; his easy upsetting of Passavant; the lightness of the touch with which he overthrows Dr. Marggraff, are delightful. It is impossible to quote, but as an example of the best vein of archæological criticism we may take the investigation by which, if we are not too easily convinced, he develops the astounding fact that Raphael was really the pupil, not of Perugino but of Timoteo Viti, commonly believed to be his pupil, and only to have come into the studio of Perugino as an assistant about 1500.

The complete demonstration is too long to be quoted and too terse to be much abbreviated, but it shows that Perugino was not in Perugia for any considerable time between 1493 and 1500, while Raphael is said to have entered his studio in 1495; *per contra*, that Raphael had a warm friendship for Timoteo, a pupil of Francia, fifteen years the senior of the Urbinate, and already a prominent and delightful painter when Raphael began his studies; and that, as far as the indirect testimony of pictures and documents can go, it is the most probable conclusion that Raphael was a pupil of Timoteo until about 1500, when Perugino came to the comparatively steady occupation of his studio in Perugia. This demonstration is followed out with such logical concatenation of evidence, dates, and data, the result of an exhaustive investigation in every direction, that a new examination of all the material, the discovery of new information, or the demonstration of the falsification of Signor Morelli's data, alone can save Perugino his chief title to glory. Morelli's conclusion is that Raphael was the pupil of his friend and townsman during the period between 1495, when Timoteo came home from his studies under Francia, until 1500, when, already a tolerably accomplished painter, he entered the Peruginian studio; and that the oft-noted likeness between the work of the two was due to the boy of twelve having adopted the style of his friend of twenty-seven, rather than the reverse, as has been generally taken for granted.

"Now let me ask any unprejudiced and thinking student of art, is it seriously to be imagined that a talented artist like Timoteo, in his twenty-seventh year, after completing his years of study with Francia, would let himself be taken in hand and tutored by a boy of twelve? Is not exactly the opposite theory by far the likeliest?"

The argument is illustrated by facsimiles of various drawings, and Timoteo is shown to have displayed the characteristics which have caused him to be considered Raphael's pupil (and, in one case adduced, even caused one of his pictures to be accepted as Raphael's until documentary evidence was found which showed that it was Timoteo's) before Raphael's own style was formed and before he became a pupil of Perugino.

The study of Signor Morelli is certainly the most valuable contribution to the archæology of Italian art which the modern scientific spirit has brought out, and causes but one regret—that its field has been so circumscribed.

English Poetesses. A Series of Critical Biographies with Illustrative Extracts. By Eric S. Robertson, M.A. Cassell & Co. 1883.

"THERE are not less than sixty women in our own day," says Mr. Robertson, "who have written verse which would have attracted great attention a century ago"; and although he immediately adds that "we are being punished for the increase of poems by the decrease of poetry," the mere number of women who now profess literature is very significant of the change that has taken place within a hundred years in the intellectual condition of the sex. Mr. Robertson has not confined his attention to living poetesses, but has given a biographical sketch of all who can be regarded even by the most indulgent as having obtained any distinction, from "the matchless Orinda," Katherine Philips, to the more brilliant of the shining ephemera of the present moment.

On reading the volume, one is particularly impressed by the shocking mortality of poetic reputations among women; it is almost infantine. Of most of these poetesses the present generation is practically ignorant, for their works have perished, while their names survive for a little. Aphra Behn is a scandal to the sex; Mrs. Piozzi, Hannah Cowley, Mrs. Smith, Mrs. Norton, Miss Smedley, only the bookworm devours; Lady Mary Montagu is known as a letter-writer, Mrs. More (alas for her thirty volumes!) as a very respectable moralist, Miss Baillie as a Scotchwoman. Miss Anna Seward, "the Swan of Lichfield," who "from her earliest days cherished the notion of becoming a songstress"; Mrs. Opie, of whom it is here said "dukes and princes, and even kings, cherished her friendship with affection"; L. E. L., "the English Sappho"; Mrs. Southey, "the Cowper of poetesses"—who reads them now? In fact, the comparative weakness of women in poetic composition has suffered a very severe exposure in this revivification of expiring mediocrities. A few exquisite lines of Mrs. Barbauld's, some half-dozen beautiful Scotch ballads that have practically become anonymous, George Eliot's great hymn, and the uneven and inartistic works of Mrs. Browning are all of undoubtedly permanent worth that women have contributed to the second great age of English poetry. Mrs. Hemans and Miss Procter, touching as many of their compositions are, are receding names, and of Miss Rossetti and Miss Ingelow it is too soon to speak. Mr. Robertson himself is convinced, by the force of what seems his unpremeditated demonstration, that some general reason must underlie this ineffectiveness of woman's song, and he attempts an explanation; but as this, like nearly all the original work inserted in the interstices of his compilation, is superficial and commonplace, we shall not examine it. Of his thought and style some judgment may be made from a remark or two which light up his pages with unintended humor. Thus, of Mrs. Hemans he very truly says: "Her love-poetry may be said to be that of the domestic affections rather than that of the elective affinities by which the sublimest souls, with peril to themselves, grope for each other"; surely a natural characteristic, since we are informed that, "under the sheltering wing of her mother, Mrs. Hemans brought into the world a family of five sons." Sometimes, however, the author is altogether too spiritually profound. What does he mean, for example, by saying that "every birth is a try-back after innocence"? It is only as a convenient repertory of facts that his book is valuable.

Our American Cousins. By W. E. Adams. London: Walter Scott. 1883.

IF we go into any considerable public library we shall find rows of shelves covered with the works of American tourists in Europe. They were for the most part written from twenty-five to fifty years ago, when foreign travel was confined to comparatively few persons. To write now of an ordinary tour abroad would be very much like describing a trip from New York to Philadelphia. The tide has turned the other way, and it is the European traveller in the United States who gives his impressions to the world. But while the American traveller is attracted by art and architecture and the varied local color which history has given to the several nations, the European devotes his attention to two quite different problems: (1) What is the meaning of the political institutions under which this great democratic republic has grown to be such a figure in the world? and (2) What sort of homes are awaiting the vast swarm of emigrants, not by any means now limited to the poorer classes, who are pouring across the ocean? One reads with something like amusement the nearly uniform answer to the first question, whether proceeding from men like Spencer and Freeman, or our less ambitious author—which is, in substance, We give it up! As to the social question, the former class, while acknowledging the attentions which they receive, naturally miss the gradations of class which are suited to their tastes and habits. The hearty optimism of a man of the people is much more likely to influence the mind of a well-to-do citizen of Scotland or North England who, with a large and growing family, is wavering as to the chance of bettering their prospects in the new world. As the present book is a republication of letters to the Newcastle *Weekly Chronicle*, they probably reached this class.

From his rosy views we concluded that the writer was a young man till we found him greeting a friend with whom he was engaged in political movements in England a quarter of a century ago. He goes so far as to say that hotel clerks are always civil and obliging, and is the first person whom we ever heard speak a good word for the boys who sell books, candy, prize

packages, and cigars in the cars, describing them as an "exceedingly useful institution." As there must, however, be a background to every picture, he has a chapter on murders, including reference to Guiteau and his trial, to the James boys, and to the general lawlessness, not even confined to the frontier States. In a foot-note he quotes the remark of his friend W. J. Linton, which seems to us to include more political philosophy, as applied to the United States, than the rest of the volume, or indeed than many volumes which have been written—namely, that our difficulty is "not in the occurrence of crime, but in the escape from punishment through laxity of law." The key to so much which puzzles foreigners among us is, that our people have not yet discovered that it is of not much use to make laws unless provision is also made for their enforcement; and that the science of administration, almost wholly neglected, is the one thing necessary to give to our Government, local as well as national, the assurance of permanent stability.

The chapter on the disposition of the public lands echoes a foreboding, which seems to be common among foreigners, that it is laying the foundation for a landed aristocracy. We cannot see any great occasion for alarm. Mr. Smith, the Liberal member for Liverpool, in an article in the *Contemporary*, points out that all the countries which have made most progress in civilization are just those where private ownership in land prevails, and that the most miserable conditions of society are those where land is held in common. However that may be elsewhere, our case is exceptional in two respects, first, that a simple system of transfer makes land just as salable as any other property; and, second, that the possession of land as such carries with it no special distinction, either social or political. Large farms are held in the newer States and Territories, because, with modern machinery, they pay; but we suspect that the tendency in the older States, which time will extend to the new, is to separation rather than aggregation of land-holding. The policy, so much condemned, of land-grants to railways has also two sides. In the first place, the grant is of alternate sections, so that the remainder receives a full equivalent in value either for the Government or its grantees; secondly, the railway cares nothing whatever for the political or social advantages of land-holding, nor is it tempted to hold for future value, but is anxious to sell as quickly and to as many people as possible, because the business thereby brought is of more value than the land itself; and lastly, the shareholders desire only that the lands shall be sold, and the results reach their pockets as quickly as possible in a money form. Railway feudalism is one of the smallest dangers that this country has to dread.

The topics which we have selected will show the character of the book, and we will add that it at once is entertaining and affords a soothing titillation to the vanity of the true-blooded American.

Brief History of Ancient, Mediæval, and Modern Peoples: with Some Account of Their Movements, Institutions, Arts, Manners, and Customs. A. S. Barnes & Co. 1883. 12mo, pp. 600.

THE series of "brief histories," published by Messrs. Barnes & Co., has earned a high reputation as school text-books. Of the whole series, the history of ancient peoples, forming the first part of the work before us, is probably the best, and we are inclined to think it the best ancient history for the common schools. The modern part suffers somewhat, we must think, in the comparison. In the first place, it is out of proportion. Taking into consideration the needs of American school-boys, nine-tenths of whom will never study or perhaps read any other history, the decided preponderance ought to be given to modern history proper—that is, the period since the Reformation. We should say that these four centuries ought to have fully half the space, and the last hundred years at least half of this. But in this volume of 600 pages, modern history begins on page 423, and the French Revolution on page 536. This is, however, only an illustration of the thoroughly unpractical way in which history is usually taught in our schools.

The defect in question is at the bottom of the defect next to be mentioned. It is impossible, in the few pages given here, to present a view of mediæval and modern history at once complete and graphic. The work in detail is very well done, but it undertakes to do too much. Boys of fourteen need not be told about every king and every battle; a few leading characters and events should be selected, and these should be impressed upon the memory by skilful narration and careful depiction of character. Here again we do not criticise this book, but the prevalent school methods.

Many of the illustrations are mere pretty pictures, of neither historical nor educational value; there are, however, many excellent maps and portraits, and occasionally a picture which does something more than please the eye, especially in ancient history. A made-up picture is as likely as not to teach what is untrue; as, for example, the Pope crowning Charlemagne (p. 334), with the triple tiara on his head—which was not adopted by the popes until the fourteenth century. The maps are well selected and instructive; but the map of the great voyages of discovery, etc. (p. 426), is hard to understand. It would seem to show the present colonial possessions of Great Britain, etc., and therefore gives the British color to Canada; but the French color embraces the territory west of the Mississippi, *including Oregon.*

BOOKS OF THE WEEK.

Carey, Alice. Clovernook: or, Recollections of Our Neighborhood in the West. 2 vols. First and Second Series. New edition. A. C. Armstrong & Son. $2.50.
Disosway, E. T. Sydney, the Knight: an Historic Tale of Rustic and Religious Life in England in the Sixteenth Century. Philadelphia: American Sunday-school Union.
Hervey, Rev. G. W. Manual of Revivals. Funk & Wagnalls. $1.25.
Hinsdale, B. A. Schools and Studies. Boston: J. R. Osgood & Co.
Hollis, E. B. Cecil's Summer. T. Y. Crowell & Co. $1.25.
Hoppin, S. B. The Medical Directory of Philadelphia, for 1884. Philadelphia: P. Blakiston, Son & Co. $1.50.
Howells, W. D. The Register: a Farce. Boston: J. R. Osgood & Co.
Jacob, Rev. E. A. The Lord's Supper Historically Considered. London: Henry Frowde. $1.
Knight, Dr. C. H. A Year-Book of Surgery for 1883. G. P. Putnam's Sons. $1.50.
Laveleye, Émile de. The Elements of Political Economy. Translated. Introduction and supplementary chapter by F. W. Taussig. G. P. Putnam's Sons. $1.50.
Leland, C. G. Hans Breitmann's Ballads. Complete edition in one volume. Philadelphia: T. B. Peterson & Brothers. $4.
Lincoln, Jeanie G. Her Washington Season. Boston: J. R. Osgood & Co.
McLaren, W. S. B. Spinning Woollen and Worsted. Cassell & Co. $2.
Neubaur, L. Die Sage vom ewigen Juden. B. Westermann & Co.
Newman, Rev. J. P. Christianity Triumphant. Funk & Wagnalls. 75 cents.
Oliphant, Mrs. The Wizard's Son: a Novel. Franklin Square Library. Harper & Brothers. 25 cents.
Seaver, E. P., and Walton, G. A. Logarithmic and Trigonometric Tables. Philadelphia: J. H. Butler.
Sheppard, N. Darwinism, Stated by Darwin Himself. D. Appleton & Co. $1.50.
Statesman's Year-Book, for 1884. Macmillan & Co. $3.
Symington, A. J. Hints to Our Boys. With an introduction by Lyman Abbott, D.D. T. Y. Crowell & Co. 75 cents.
Taussig, F. W. Protection to Young Industries, as applied in the United States. G. P. Putnam's Sons. 75 cents.
Thirty Thousand Thoughts: being Extracts covering a Comprehensive Circle of Religious and Allied Topics. Sections I.–V. Funk & Wagnalls. $3.50.
Topographical Surveying. Including articles by G. J. Specht, C.E., Prof. A. S. Hardy, Prof. John B. McMaster, and H. F. Walling. Science Series. D. Van Nostrand. 50 cents.
Tuke, Dr. D. H. Illustrations of the Influence of the Mind upon the Body in Health and Disease. Second American edition. Philadelphia: Henry C. Lea's Son & Co.
Wentworth & Hill's Examination Manuals. No. II.—Algebra. Boston: Ginn, Heath & Co. 40 cents.
Wheeler, E. J. Pulpit and Grave: a volume of Funeral Sermons and Addresses from Leading Pulpits of America, England, Germany, and France. Funk & Wagnalls. $1.50.
Young, R. Light in Lands of Darkness: a Record of Missionary Labor. Cassell & Co. $2.
Zola, E. The Joys of Life. Translated. Philadelphia: T. B. Peterson & Brothers. 75 cents.

HENRY HOLT & CO., N.Y.,

HAVE READY:

Life and Poems of Theodore Winthrop.

Edited by his Sister, with portrait. 12mo. $1.50.

Called Back.

A fascinating novel. By Hugh Conway. 16mo, Leisure Hour Series, $1.00; Leisure Moment Series, 25 cents.

The Pagans.

By Arlo Bates. 16mo (American Novel Series), $1.00.

Pilgrim Sorrow.

A Cycle of Tales by (Carmen Sylva) Queen Elizabeth of Roumania. Translated by Helen Zimmern, with *an etched portrait by Lalanze.* 12mo, $1.50.

Examples for Elementary

Practice in Delineation. By Charles H. Moore, Instructor in Drawing in Harvard College. 4to, $2.00.

A book of great value, intended for schools and for isolated beginners in Drawing. It contains twenty examples in outline—ten from nature, and ten from historic works of art—with all needed explanations and directions.

The plates from works of art are selected from some of the very finest examples of linear design in the ancient and mediæval schools.

"We shall expect the best results from the wide introduction of these drawing-books."

At your own home you can by Dr. RICH. S. ROSENTHAL'S

MEISTERSCHAFT SYSTEM,

Learn to speak fluently either

Spanish, French, or German

IN TEN WEEKS,

FOR THE NOMINAL PRICE OF $5.00.

The celebrated author, Dr. Rosenthal, of Berlin, is now with us, and will correct all your exercises and explain all difficulties free of charge, so that in fact you study under one of the leading linguists of the world.

AN ADVANTAGE OFFERED BY NO OTHER SYSTEM.

Sample Lessons in Spanish, French, or German, 25 cts.

The *Transcript*, Boston, says: "In one word, the Meisterschaft System does for the acquirement of French and German what Phonography has done for the acquirement of short-hand."

Says the *Nation*, New York: "This is, without doubt, the best system ever devised for learning to speak a foreign tongue in a short time."

Send $5.00 for full subscription, with privilege of having your exercises corrected and questions answered. Advance orders for the Spanish received now.

ESTES & LAURIAT, Pubs., 301-305 Washington St., Boston.

The Nation.

NEW YORK, THURSDAY, MARCH 27, 1884.

The Week.

THE Democratic caucus on Tuesday did not impose the Morrison bill on the faithful in an absolutely compulsory manner. Some concessions were made to the right of private judgment and the wishes of constituents. But it is difficult to say exactly what the final result was. The *Herald* thinks it was a defeat of the tariff reformers. The *Times* maintains that it was "nothing," or meaningless. The *Tribune* says that the party in the House stands now just where it did before the caucus was held. What the *Sun* thinks is, however, of more importance than what any of them think, and the *Sun* evidently thinks there was some meaning in the result, and is much displeased with it, for it intimates that in the matter of Democratic blundering there is nothing worse to come. This indicates, of course, that, in the *Sun's* eye, the tariff reformers have achieved some sort of success. To the outside observer what apparently happened was, that the Morrison bill was not repudiated; that its consideration as a Democratic measure was determined on that Democrats might oppose or criticise it, but that in doing so they were to be under a moral obligation to remember that the majority of the party approved of it. In order to appease the non-whiskey States of the South, Mr. Morrison has offered to reduce the tax on tobacco, and also that on applejack and peachjack, or whatever the alcoholic product be called which is obtained by distillation from peaches.

The protectionists at Washington are gloating over the chances of a Democratic "split" on the Tariff Bill, and are trying to frighten Messrs. Carlisle and Morrison by reminding them of 1860, and the trouble that discord in the ranks on another point then entailed. This is merely the old "harmony" dodge in a new and ridiculous shape. Year after year it has prevented the Democrats from taking a positive stand in favor of any reform in which the public is interested. For the sake of "harmony" they have stultified themselves with regard to free trade and civil-service reform, and every other important question that has come up since the war; and as a result they have got neither "harmony" nor offices; while the Republicans have had the most terrible dissensions inside the party, and yet have managed to carry the country with them every four years. The Democrats who, like Mr. Morrison and Mr. Carlisle, have some political ideas, are evidently sickened with "harmony," and are beginning to wonder whether a good dose of discord might not do the party some good. We believe they are right, and that, if they do split on the tariff, the free-trade section of the party will be able to look back hereafter to the day of the split as the birthday of a real Democratic party. The fact is, that a party without discord cannot long retain its vitality. In politics, as elsewhere, beliefs, if real, must be fought for or fought against by party men, and cannot be covered up and hidden in a corner, or treated as if they did not exist.

The Bonded Whiskey Bill in the House, which proposes to give the great distillers, who have been guilty of overproduction, longer time to pay their taxes in, is in some danger from the opposition of the small home distillers of the Southern States, who are jealous of the great manufacturers of Kentucky, Tennessee, and Ohio, and whom they accuse, not without reason, of encouraging the revenue officers in their pursuit of them. The Southern and Southwestern farmer is fond of making his own liquor in his own barn out of apples, peaches, and the like, but finds himself ruthlessly pursued by the revenue officers whenever he does so, and believes that the great distillers egg them on. His representatives in Congress, therefore, have received numerous warnings that they must not help the great whiskey men out of their present trouble. It is accordingly proposed by the Democrats, with that disposition to sacrifice great things to small for which they are remarkable, not to abandon the big whiskey men, and to appease the little ones by taking the tax off applejack and other stimulants made from fruit, so that the small farmer can get drunk cheaply on the product of his own land.

The opposition to the Bonded Whiskey Bill is likely to be strengthened, says a late rumor, by a remark of Little Phil Thompson, the Kentucky member who committed a social murder last year, that its opponents were a lot of "temperance cranks." This, with other indications that the liquor interest throughout the country is not only making its way into politics, but becoming aggressive and defiant, is likely to bring about the defeat of the bill, by rousing the hostility of many who were disposed to let it alone. There is nothing just now which would better become the liquor fraternity, high and low, than "modest stillness and humility," and the brewers of beer would consult their own interests by not appearing in politics with threats and defiance, in alliance with the distillers and whiskey dealers. There is still, even among the "temperance cranks," a readiness to distinguish between beer and spirits as agents of social enjoyment, but we do not believe it would long survive the formation of a great alcoholic party, formed with the avowed object of frustrating all attempts to regulate the sale of intoxicating drinks. People are already getting tolerably disgusted with the use of the Government warehouses to enable whiskey speculators to evade some of the legitimate consequences of their reckless overproduction, particularly when they hear that the distillers are still producing at the rate of 95,000,000 gallons a year. There is not a gallon of it in which there is not some danger to life or property.

The debate on the Bonded Whiskey Bill has disclosed a sort of private alliance and tacit understanding between the Republicans and the high-tariff Democrats to force another reduction of the internal revenue, in order to relieve the Treasury of its surplus income. There being no internal revenue of consequence remaining except the taxes on whiskey, tobacco, and bank-notes, we are curious to see where the allied forces will begin the work of reduction when they shall have defeated the Morrison bill. To tax bank-notes as much as possible is an article of Democratic faith. To tax whiskey as much as possible is equally a matter of Republican faith. Both parties might, under stress of weather, unite to repeal what is still left of the tobacco tax; but this would not obviate the need of some reduction of the tariff. In this dilemma the suggestion of Mr. Belford of Colorado is naïve and timely. Mr. Belford proposes that the problem of surplus revenue be attacked at the other end. Instead of stopping the sources of income, he would "put the money in circulation among the people." He would make the disbursements equal to the receipts, and to that end he would set his face as a flint against every measure of economy. Mr. Belford's plan has the merit of frankness, but will, we fear, be exposed to those difficulties of execution which always embarrass "a square divide" of the proceeds of common pillage.

The Lasker incident has ended in Bismarck's inviting Mr. Sargent to a dinner in honor of the Emperor's eighty-seventh birthday, and in our Minister's attendance. He was also invited to a "swarry" at the palace. The dinner is the principal thing, however. In countries where a stiff etiquette prevails, a man may be let in after dinner to a house where he would never be invited to dine, and, according to foreign ideas, no better proof of Bismarck's good will to the United States could be given than in inviting Mr. Sargent to his table. This will, we presume, put an end to the story that Bismarck hates Mr. Sargent because of a letter written by the latter, explaining the German hostility to American pork by the fact that the Prince himself is a great landowner and pork-raiser.

The moral of the Lasker incident as regards the House of Representatives is this: Never pass resolutions, especially those relating to foreign politics, without knowing what they contain. It would have been more consonant with our notions of magnanimity and high statesmanship if Prince Bismarck had transmitted the Ochiltree resolutions to the Reichstag without comment; but he was not bound to do so even if the phraseology of the resolutions had been agreeable to him, there being no recognized channel of communication between the legislative bodies of different countries. For this reason the form of the resolution ought to have been considered with care. If the intention was what the House now says it was, viz.: to be "a tribute of respect to the memory of an eminent foreign statesman

who had died within the United States, and an expression of sympathy with the German people for whom he had been an honorable representative," it would have been well to have confined it to those lines, in which case there would have been no Lasker incident to lacerate our feelings afterwards. The original resolutions were the product of a total want of system in the matter of giving expression to the views of the House. The lesson which Prince Bismarck in his unfeeling way has taught us, will not be without its value if it leads to greater carefulness in confining the opinions which we send abroad under official seal strictly to the subject in hand. Turn it as we will, it is humiliating to acknowledge, as the House has been forced to acknowledge, that it said something more than it intended to in the first instance. If the practice of the *hari-kari* were in vogue, Mr. Ochiltree might well avail himself of its privileges.

It is difficult to feel much sympathy for the Republicans of Congress in their steadily increasing perplexities with Keifer. The two investigations which have been made in regard to his performances with a stenographer and a newspaper correspondent have resulted in showing that nearly all of the worst things said about him were true. The committees are in great trouble about the revelations, and are likely to lack the necessary courage to report them plainly to the House. So far as the case of the stenographer is concerned, there has never been any doubt about the nature of Keifer's proceedings in that. He forced a faithful employee of the House to resign on the eve of adjournment, in order that his own nephew might be put in the place and might draw the vacation salary which the other man had earned. The investigation has not only established this fact beyond dispute, but it has shown also that in order to escape the odium of his acts, Keifer has not hesitated to make statements which have been refuted by documentary evidence in the form of letters in his own handwriting. In reference to the dispute with a newspaper correspondent, the case is not quite so clear, but it is clear enough to show that Keifer is a statesman who resorts to methods which few public men would care to stoop to. If he had not been "vindicated" by the Republicans at the opening of the present session, when he was given the complimentary nomination for Speaker as an answer to the assaults of a "venal press," it would be much easier for them to dispose of him now. As it is, however, they will probably endeavor to carry their self-imposed burden with as few groans as possible.

The principal event of last week in the business world was a further "cut" in east-bound freight rates, or rather two such cuts, which have brought the figures down to 15 cents per 100 pounds for grain, with corresponding reductions on provisions and miscellaneous produce. As these cuts had no perceptible effect on the stock market, or on the grain market, or on the export trade, it was at once concluded that the actual rates for some time back had been as low as the new cut rates, if not lower. This view is confirmed by a telegram from Chicago which says that actual grain rates are twelve cents per hundred pounds, or three cents below the newly published rate. It is expected that Commissioner Fink will make a further reduction within a few days. Indeed, it is now a matter of life and death to the Trunk-Line Pool to put an end to secret cutting, and the only means of defence left is to make the public rate as low as the lowest private rate. The *Financial Chronicle* furnishes figures going to show that at fifteen cents per hundred the railroads do not get back first cost, but this is by no means clear (as the *Chronicle* acknowledges), since its calculation is based upon the ascertained cost per ton-mile of carrying all freight, through and local, and not upon that of through-freight alone. Before announcing any decisive opinion on this matter it is necessary to know also how much it costs a road to let half of its rolling-stock lie idle.

General trade remains in the same torpid condition as before. The course of the grain and provision markets has been downward, that of dry goods, iron, and general merchandise stationary. Some faint symptoms of improvement in the weather have been hailed as the harbinger of the long-deferred spring trade. Indeed, if we are to have any spring trade at all this year, it must come very soon. It seems to be the common opinion that we have reached "hard pan," that prices cannot go lower, and that the weak concerns have been nearly all weeded out. The record of business failures remains about the same as before, showing a continuous drizzle of small suspensions. The demand for a new bankruptcy law is naturally increasing, and the inaction of Congress upon this subject is by many considered to be one of the contributing causes of the existing dulness. Business on the Stock Exchange has apparently reached its minimum. Commission houses are scarcely making office expenses. The investment demand of the public is confined almost exclusively to bonds. Nevertheless, prices have been well sustained, and there is a general feeling that any change from this time forward must be for the better.

The resumption of gold shipments on a moderate scale is not a circumstance to excite alarm, but rather the contrary. The money market has been for a long time in a state of congestion. If money can be used to better advantage in London than here it will go there, and ought to go there, till an equilibrium is established. If fifteen or twenty millions of gold were exported it would tend to advance the prices of commodities in England, and to lower them here, so that new life might be put into our sluggish trade in grain, cotton, and provisions.

The Rev. Henry Ward Beecher's opinions on any current topic are sure to be facetious, and are often, but not always, instructive. When he says that "a tariff with incidental protection is like beefsteak with incidental strychnine," we perceive that he has hit the nail on the head. But when he says that a Presidential candidate ought to be jovial, and that jovial men are commonly "big-bellied and big-chested," and that here Senator Sherman and Senator Edmunds are found wanting, "having able heads with shad bellies," we can only say that he has added new terrors to the political arena. It is interesting, however, to know that Mr. Beecher prefers Mr. Arthur as a candidate this year, regardless of his qualifications as a story-teller or his measure around the waist. He thinks that General Sherman could be elected, although his wife is a Catholic, and that his standing by his wife under the disadvantage of her being a Catholic is very much in his favor. An alluring hint was given by Mr. Beecher to the *Herald* interviewer that he "could name a ticket for the Democracy that would carry the country without a doubt." But he declined firmly to render the Democracy the service of naming it.

The testimony thus far taken as to the Ottman compromise throws no additional light on the connection of Mr. Richard Crowley with it—though this is a most important matter. The main facts are undisputed. Ottman's money was, by a compromise, divided between the Government and the lawyers, the lawyers getting the lion's share. In this Mr. Crowley had a hand, and what it would be worth the while of the Investigating Committee to find out is, whether he acted for Ottman or the Government, or, as has been alleged, for both sides at once; and if the last, how it happened that a Government officer could stand in such a relation to an offender against the Government, whom the Government was prosecuting.

The late Sir Edward Archibald's nephew has written to the London *Telegraph* that his uncle never for a moment supposed that the Thurlow Weed Barnes "Benjamin" letter was written by Mr. Judah P. Benjamin, and adds cruelly that what Mr. Barnes found in the Thurlow Weed collection was only a copy after all. This, the *Tribune* truly remarks, leaves Mr. Barnes "in a sorry plight," for he said that he had ample evidence of the genuineness of the document as the production of the Southern Senator. But it ought to have said something complimentary about the remarkable process of reasoning by which Mr. Barnes met the objections offered to his discovery *ab extra*. That was a very neat bit of dialectics, which must always remain a comfort to him.

The bill extending and making mandatory in cities of over 20,000 population the State Civil-Service Act is now before the Senate. The police force was exempted from its operation in the Assembly on the motion of Mr. Husted, who compared the police, somewhat ludicrously, to an army. It is an army in so far as it obeys the orders of a commanding officer and is drilled and disciplined; but it differs from an army in the very important facts that anybody can leave it when he pleases; that its duties enable its members to live with their families in one spot; that they enjoy what few other functionaries in this country, except the United States Judges, enjoy, a life tenure—being only removable after trial; that they receive what is, for this class of men, splendid pay,

such as no other police force receives, besides being pensioned when superannuated, and having a handsome compensation paid to their families in case of death. It differs from every army in the world, too, in being commanded by a board of obscure local politicians—which is perhaps the most important difference of all—who are chosen for the express purpose of making the force what it ought not to be, a partisan body. It would never occur to any human being to put Steves, Sids, Joes, or Jimmies at the head of a police force for any other reason.

We have no fault to find, however, with the pay or tenure of the police. What we do find fault with is the way in which it is governed, and in which admission to it is obtained. We know that certain formal precautions now surround its recruitment, but, like the old Federal pass examination, these are a complete sham as a defence against favoritism and political corruption. For no branch of the public service is the safeguard of competitive examination more necessary. Every honest man in this city, of the proper physique and character, ought to have as fair a chance of entering the force as any other man, whether he have a politician to back him or not, and the city is entitled to the services of the best men to be had. But so thoroughly is the force impregnated with the foul influence known in this city as "politics," that even if the competitive system were established to-morrow, and all future appointments severed from partisan and personal influences, it would take many years to purge the force and bring it up to a satisfactory standard of efficiency. We cannot begin a day too soon, and the change will certainly be made, and probably before very long. The O'Briens and Husteds may as well make up their minds to that. The people of this State have at last begun to turn their attention to the best means of getting decent administrative service, and they are going to have it.

The bill depriving Mr. Edson of authority to make any appointments of heads of departments running over into the next Mayor's term has passed the Senate, and will, no doubt, pass the Assembly. It applies to the Comptroller, the Commissioner of Public Works, and the Corporation Counsel, and will prevent any Kelly-Edson deals as to those offices. The bill provides that any one who is appointed by the present Mayor shall go out of office on February 1, 1885, and that the new Mayor (to be elected next fall) shall appoint successors, who shall hold office for the terms during which the officials whom they succeed would otherwise have held office. The act is to take effect immediately, and all acts and parts of acts inconsistent with it are repealed. We mention this because the bill making the Comptroller elective, now in the Governor's hands, appears to be inconsistent with it. Should the Governor sign the Comptrollership bill to-day, and afterwards sign this bill requiring the new Mayor to appoint a Comptroller, the later act will apparently override the former. This result, however, would not follow if the appointment bill were to receive his signature first. We presume that Messrs. Roosevelt and Gibbs and the Committee of Fifty-three may be relied upon to prevent their scheme of reform from being impaired by accidents of this nature.

There are now pending at least three different measures which affect the Mayor's power of removal: the two mentioned above, and a third giving the Mayor absolute power of removal. All three seem to trench upon the existing provision of law, making it impossible to get any heads of departments out of office without a "hearing," which experience shows means a lawsuit. Now it is of the most extreme importance that the new legislation shall be so plain and distinct that there can be no room for dispute about it, and no chance for litigation. A judge with an injunction or a mandamus is always the last hope of an ousted city politician, and this time he ought to be "bounced" out of the courts as well as out of his offices.

When Mr. Isaac H. Bromley took the editorship of the *Commercial Advertiser* with a view of making it decent and respectable, we pronounced the task a herculean one, which would probably prove more than he was equal to. Our forebodings turned out to be correct, for in a few weeks he abandoned the attempt in despair. The evil was too deep-seated to be eradicated by any editorship however good. It was plain that nothing short of a change of proprietorship would suffice, if any change would suffice. This change has now been effected, and the experiment will be tried in complete freedom from the debasing influences which have so long surrounded the paper. The new conductors are young and ardent, and have high aims, and may be able to cleanse the Augean stable. We sincerely hope they will; but they have still to reckon with the old subscribers, who will probably be much tried by anything in the nature of reform. They liked the blackguard, flippant, ignorant, silly, venal, and mendacious old *Advertiser:* will they put up in its stead with a "first-class newspaper in all respects—political, literary, artistic, and commercial"—such as the new proprietors now promise us? Perhaps they will, but we fear that the present managers will have, in order to hold them, to rely largely on the fact that now that the old *Advertiser* is gone there is absolutely nothing quite as bad in New York journalism to fall back upon. They will have to read a better evening paper than they were used to, or go without any.

The use of the revolver among women to right the wrongs done them by men is, of course, encouraged by the attitude of juries towards women in general and especially towards murderesses. On Saturday two murders were committed by women with pistols, and in both cases the murderesses seem to have armed themselves in advance, "just like" a male murderer. In Hazleton, Penn., Mrs. Thomas Rees, "driven to desperation by the taunts and jeers" of Mrs. Simmons, of whom she was jealous, suddenly pulled out a pistol, and with it killed an innocent bystander, who was unwise enough to undertake to save Mrs. Simmons's life. On the same day, in Syracuse in this State, Mrs. William Ransier killed Mr. Adam Sutter, with whom she had had a good deal of trouble, and in this case, too, she seems to have armed herself in advance, with an eye to whatever might turn up. Is it customary for women to carry pistols? It might be worth while to find out in such cases where the pistol had been concealed up to the moment of use. Is the "hip-pocket" coming into vogue among women for this purpose?

The Parnellites have apparently hit upon a new mode of resistance to the Government which is likely to give some trouble. The Repression of Crime Act enables the Lord Lieutenant to station extra policemen in proclaimed districts in which murders or outrages have been committed, and impose the cost of them on the taxpayers, which they are now advised by Mr. Parnell not to pay; and the Limerick Common Council seem to have begun the war by refusing to obey a mandamus directing them to levy the rate. The object of the law is, of course, to oppose the tendency of the people of the localities in which crimes are committed, to shield the criminals, either through sympathy or fear. The remedy is a legitimate one enough and is efficacious, but the proposed resistance to it shows the difficulty of combining constitutional and despotic methods of government. The cost of extra police in a disturbed district ought to be paid by the district itself, but if the tax has to be imposed by an outside authority regarded by the people as hostile, it ought not to have to be levied by a Common Council. The rule of the strong hand can rarely be maintained through half-measures.

The most curious thing in the news from the Sudan, which is so varied and contradictory, is the disappearance from it of the old, original, and genuine prophet the Mahdi, and the substitution of Osman Digna, who was at first spoken of as the Mahdi's lieutenant, but is now treated as a principal who does what he pleases, and is accountable to nobody. There is probably just as much exaggeration in the stories about him as there was in the stories about the Mahdi. His force was multiplied by three or four, and his sanctity in the eyes of his followers probably doubled. It would appear now that he is not subdued, and refuses to make terms; but as long as he cannot be pursued there is no reason why he should make terms. The British have no force capable of following him into the desert. He will probably make it difficult, at least, to open communication between Suakim and Khartum by way of Berber, but the making of communication difficult for all strangers is, and has been from time immemorial, the business of the desert tribes. Some of them get their livelihood, or a considerable part of it, in this way. The probabilities seem to be now that Osman will harass the British with a small force, but will not risk another action, and that three or four months hence there will be a reaction in England against the "forward" policy in the Sudan, as there was against the forward policy in Afghanistan.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 19, to TUESDAY, March 25, 1884, inclusive.]

DOMESTIC.

A CONFERENCE of the Democratic free-trade leaders in Congress was held on Friday, and as a result, later in the day, a call was issued for a caucus to be held on Tuesday night, to consider the Morrison Tariff Bill.

The caucus was attended by all but ten members, and the following resolution adopted by 114 to 57, after a long debate: "That the bill commonly known as the Morrison Tariff Bill shall be taken up for consideration at the earliest practicable day, and reasonable time for debate allowed thereon; and, after such debate, that a bill be passed for the reduction of duties and war-tariff taxes; that the adoption of this resolution shall not be considered binding in controlling the individual action of Democrats, except to the extent that each member may feel that he ought to be influenced by the expressed opinion of the majority of his associates." A resolution offered by Mr. Carlisle was then adopted (88 to 57), as follows: "That in order to reconcile conflicting opinions and to secure legislation reducing taxation, the plan for the reduction of taxes at the present session of Congress shall embrace a provision repealing all internal-revenue taxes on tobacco, snuff, and cigars, and special taxes connected therewith, and also reducing the tax on brandy distilled from fruits to ten cents per gallon; provided, that such repeal and reduction shall not be made except in connection with a reduction of tariff duties." The large vote against the first resolution is considered an indication that the Morrison Tariff Bill cannot be adopted.

The House Committee on Foreign Affairs reported on Wednesday its resolutions on the Lasker matter. After calling attention to the fact that the previous resolution was intended as a tribute of respect to the memory of an eminent foreign statesman, they recite: "That the House, having no official concern with the relations between the executive and legislative branches of the German Government, does not deem it requisite to its dignity to criticise the manner of the reception of the resolutions, or the circumstances which prevented their reaching their destination after they had been communicated through the proper channels to the German Government." Mr. Ochiltree, of Texas, the mover of the original resolution, opposed them, and delivered a eulogy of Lasker and a severe criticism of Bismarck. The resolutions were finally adopted without a division. The House then adopted resolutions cordially reciprocating the wishes of the Liberal Union of the German Parliament for the closer union of the two nations, and recognizing their graceful appreciation of its sympathy with those who mourn the death of Edward Lasker.

Senator Vance (Dem., N. C.), in a minority report from the Committee on Foreign Affairs, submitted on Monday, expresses the opinion that Germany has a right to exclude American hog products on the ground that they are unwholesome, if she deems it proper, and that this Government is not justified in impeaching her motives. "If it be true," continues the report, "that our pork is to any extent unwholesome, we should endeavor, by a rigid system of inspection, to remove the cause of the complaint. If it be true that fear of trichinosis is only a pretext, and that the real reason for excluding our hog products is the desire to protect their own producers, then we are the last people on earth who ought to complain. After surrounding ourselves for more than twenty years with a protective tariff wall so high as to exclude virtually all the products of Germany which compete with ours, it is rather late for us to advocate retaliation against a government which merely follows our example."

In the House, on Thursday, the seat of Mr. Mayo, Readjuster, of Virginia, was given to Mr. Garrison, Democrat.

The House refused on Monday to pass a bill appropriating $300,000 to save New Orleans from the danger of a flood on account of a breach in the levees; yeas 90, nays 115. The resolution was referred, after debate, to the Committee on Appropriations.

In the Senate, on Tuesday, a bill was passed, yeas 42, nays 13, which makes the salaries of all United States District Judges $5,000 per annum, and prohibits them from appointing to position in their courts relatives within the degree of first cousin.

It is believed that Justice Miller of the Supreme Court is a candidate for the Republican Presidential nomination, and that he has considerable support in Iowa.

Ex-Secretary George M. Robeson has written a letter to James G. Blaine, congratulating him on his chances of receiving the Republican Presidential nomination, and urging him to press forward for the victory which he predicts is to be won at Chicago. Robeson promises Blaine his hearty support.

The Boston *Advertiser* has been making a canvass among the Republicans of Massachusetts. Two hundred and eighty replies were received. For first choice Edmunds receives 198 votes; Arthur, 53; Blaine, 19; General Sherman, 3; Lincoln, 4; and Hawley, 3.

The Rhode Island Democratic State Convention on Wednesday, after several ballots, nominated George H. Corliss (the candidate of the Independent Republicans) for Governor. This was a move to break the Providence *Journal* Republican ring. Mr. Corliss refused the nomination. A straight Democratic ticket was then nominated, with Thomas W. Segar for Governor and Col. Amasa Sprague for Lieutenant-Governor. The Republicans on Thursday renominated the present State officers.

There was a lively time in the State Assembly on Wednesday when the defeated City Civil-Service Reform Bill was taken from the table for reconsideration. A motion to reconsider the bill was passed, by 79 to 32. The sense of the House was taken on the ruling of the Speaker that the bill could not be amended on reconsideration, and he was overruled. The bill was sent to a final vote with a provision making the present State Civil-Service Law compulsory in cities of 20,000 inhabitants and over, and exempting persons now in office, the police departments of all cities, and also all employees for whose proper action the Supervisors give bonds. It was passed by a vote of 82 to 32.

The bill making the Comptroller of New York city elective passed the Assembly on Thursday with only one negative vote.

Mr. Gibbs's bill limiting the term of the appointees as heads of departments by the present Mayor of New York to January 30, 1885, was passed in the Senate on Monday night by a vote of 18 to 7. On Tuesday it was ordered to a third reading in the Assembly.

As a result of the recent Assembly investigation and report, the Grand Jury on Friday in this city handed in ten indictments—three against Sheriff Alexander V. Davidson, each for grand larceny in the second degree; one against Warden James Bowe, of Ludlow Street Jail, for perjury; the rest against other minor officers. All the indicted persons were arrested and gave bail.

The State Senate Committee on Public Health, which has been investigating the adulterations of food, made a report on Friday. They have discovered wholesale and alarming adulterations of food, dangerous to the consumer and tending to depreciate property in the rural districts. Adulteration of butter by tallow oil, bone oil, and lard oil was found in almost every town and city in the State, and equals in amount half the production of natural butter. The Committee point out that our export butter trade is breaking up on account of the manufacture and sale of bogus butter. They recommend a total prohibition of the manufacture and sale of all butter adulterations after a given time. They also discovered that 200,000 out of 500,000 quarts of milk furnished in New York daily in 1882 were watered or skim milk. They recommend the appointment of a State inspector of milk. Accompanying the report was a bill prohibiting, under a penalty of $200 or six months' imprisonment, the sale of adulterated milk, keeping cows for the production of milk in an unhealthy condition, or diluting milk with water.

The New Jersey Assembly on Monday evening passed a resolution asking Congress to pass a bill "to prohibit the importation and the migration of foreigners and aliens under contract or agreement to perform labor in the United States."

The delegation of representative cattle men from Chicago in Washington during the week say: "There is not a single case of foot-and-mouth disease in this country, and there probably has not been any. Such is the experience of men who have had practical knowledge of the ravages of the disease in the old country. The disease has not the symptoms of the foot-and-mouth disease. The shell of the hoof does not come off: the whole foot is lost. This is a simple foot rot, such as is common in severe winters."

A Louisiana member of Congress, on Tuesday, received a despatch from Rodney, Miss., which said: "Kemp Levee gave way at 12:15. This makes the disaster complete, and the Mississippi Valley one vast inland sea. Congress must come to our relief and feed the people at once. The lofts of our gin houses and floating rafts will be the only place of abode."

The breaking of a levee at Roberts Island, near Stockton, Cal., on the night of March 18, destroyed 27,000 acres of wheat, valued at $500,000.

A very destructive tornado passed through parts of Tennessee and Kentucky on Tuesday.

The coal troubles in the Schuylkill, Lehigh, Wyoming, and Lackawanna regions of Pennsylvania are becoming very serious. The continued suspension of operations, and the half-pay plan that has been exacted by the leaders of the combination, are creating intense dissatisfaction among all classes of mine operators. A secret protective association is forming.

The Rev. Thomas Rutherford Bacon, son of the late Dr. Leonard Bacon, who has been pastor of the Dwight Place Church in New Haven for three years, astonished his congregation on Sunday by suddenly resigning. He gave as his reason the report that had reached him that his ministry was not acceptable to all his people. A strong effort will be made to have him withdraw his resignation.

Madame Anna Bishop, the once famous singer, died in this city on Wednesday at the age of seventy. In 1831 she was married to Sir Henry R. Bishop, the well-known composer and musical director. Her career as a singer began in 1837, and her first triumphs in concerts and oratorios were followed by brilliant success in opera. She left her husband in 1839 and made an extensive concert tour, visiting almost every country in Europe, and also this country and Australia. She started on her last tour around the world in 1875. Since its completion she has lived most of the time in this city with her second husband, Mr. Martin Schultz, whom she married in 1858. Her last appearance in public was at a concert in Steinway Hall about a year ago.

George Fuller, a landscape and portrait painter of prominence, died in Boston on Friday at the age of 62.

John J. Cisco, the well-known banker, died in this city on Sunday, in the 79th year of his age. In 1852, his financial ability caused President Pierce to appoint him Assistant United States Treasurer, in charge of

the Sub Treasury in this city. Mr. Cisco was still Assistant Treasurer when the war broke out. Some hesitation was manifested among the bankers and capitalists about investing in the first war loan. It was Mr. Cisco who induced them to take the loan, and after that there was no trouble.

I. Saunders Irving, only surviving nephew of Washington Irving, died in Washington on Sunday. He was a civil engineer.

Hubbard Hinde Kavanagh, senior Bishop of the Methodist Episcopal Church, South, died at Columbus, Miss., on Wednesday, at the age of eighty-two.

Brevet Major-General Godfrey Weitzel, of the Engineer Corps, died in Philadelphia on Wednesday at the age of forty-nine. His services during the rebellion were notable, especially as engineer of General Butler's expedition to New Orleans. He took a prominent part in the last Richmond campaign. In the capacity of Chief-Engineer of the department, he constructed the various lines of defence and bridges on the James and Appomattox Rivers, besides the approaches and piers for the pontoon bridge over which the Army of the Potomac crossed the James.

FOREIGN.

Mr. Gladstone went to Coombe in Surrey on Wednesday for his health. He was guarded by a detective.

The London *Daily News* announces: "The report that Mr. Gladstone thinks of resigning this year is absolutely unfounded. Mr. Gladstone is the last Minister who would think of quitting office in view of the present condition of affairs at home and abroad."

The second reading of the Franchise Bill was moved in the House of Commons on Monday evening by the Marquis of Hartington, Mr. Gladstone being absent. Mr. John Bright spoke for one hour in support of the bill, advocating a perfect and full representation in the House of Commons. The debate was adjourned until Thursday.

In the House of Commons on Monday a motion against the Bishops continuing to sit as members of the House of Lords was rejected by 148 to 137, the Parnellites voting with the minority.

In the House of Commons on Tuesday Lord Randolph Churchill moved that the Government submit any further news it might have regarding operations in the Sudan and concerning the position of General Gordon. In his speech Lord Randolph Churchill pronounced the mission of General Gordon a failure, and said if the Cabinet's apathy should cause the death of General Gordon the Cabinet could not remain in office a single day. After a short debate he withdrew his motion.

News was received on Saturday that General Gordon had had a successful encounter with the rebels. He steamed down the river to Halfaya, a small town surrounded by the Arabs, and succeeded in fighting his way to it against great numbers; rescued the garrison, and brought them back in safety to Khartum.

The situation of General Gordon at Khartum is regarded as very critical. He is disappointed in what he has been able to accomplish, and cannot defend the place against the advancing tribes. Retreat from Khartum has been cut off. The whole country south of Berber is in revolt.

On Wednesday the tribal rising in Egypt was reported universal from Kassala to Berber. The Arabs, also, between Korosko and Assuan were threatening to revolt. The Bedouins were massing at points on the Nile. The Batakheer tribe was preparing to attack Shendy. It was rumored at Dongola that the garrisons under Lupton Bey, in the province of Bahr Gazelle, had surrendered and been massacred.

Advices from Khartum, dated March 16, say that General Gordon had repulsed an attack upon the camp at Umderman. He was surrounded by rebels, and intended to force his way at the head of the troops along the bank of the Nile to Shendy. He proposed to begin the advance on March 18.

El Madhi is organizing an artillery corps composed of Egyptian deserters, with which he will set out on the march to Berber. He has with him twelve European and sixty Egyptian officers of Hicks Pasha's army.

It is proposed to leave 400 British soldiers at Suakim, to be relieved every fortnight, and to station the remainder of the troops at healthier points in the interior. Admiral Hewett is sanguine of being able to open the Berber route. The troops will advance on Wednesday to form camps around Tamanieb, and attempt to surround Osman Digna.

The British reconnoitering force was entrenched at Handuk on Wednesday. In the morning an extended reconnoisance was made, but the rebels were nowhere seen.

On Tuesday it was telegraphed from Egypt that the camp of Osman Digna is twenty-five miles from Suakim and thirteen beyond the advance post of the British. General Graham has determined to attack the rebel leader on Thursday, and will afterward push on to Sinkat with one brigade, if this course is practicable.

General Graham has ordered the concentration of the British forces at Handuk and Otad prior to marching out to give Osman Digna battle near Tamanieb. Osman has 4,000 combatants. All the leading sheikhs continue their adherence to him. The British Cabinet Council on Tuesday decided to give General Graham discretion to march to Berber if necessary to keep the route clear.

Marquis Tseng, the Chinese Ambassador, has been ordered to return to Paris.

The new French Minister has started for Pekin, where he will carry on peace negotiations with China. He is instructed to demand an indemnity of $32,000,000.

The French Government has decided to occupy Upper Tonquin as far as the Chinese frontier. General Millot, commander of the French land forces, has decided to attack the Black Flags at Hunghoa. After the capture of Hunghoa the French will fix the western frontier of Tonquin at Tuan-kuan, which is now in possession of the Black Flags. The Northern frontier of Tonquin will extend from Phulang-Thuong to Tuan-kuan by way of Phu-binh and Phu-doan-hong.

Prince Napoleon has returned to Paris without issuing a manifesto.

At a recent meeting in Paris of the supporters of Prince Napoleon, M. Pascal, a member of the Chamber of Deputies, said: "Prince Jerome's ardent desire is that the power of expressing the national will shall be transferred to the people's voice. He will never sanction a resort to violent measures in order to secure power. He relies on the chances of his name."

The speeches made at a banquet in celebration of St. Patrick's Day at Belleville, a suburb of Paris, contained hints that more explosions would occur in London before long. The ranks of the dynamiters are being recruited by large accessions from the Irish in Paris.

The Paris *Gaulois* on Tuesday said: "The London explosions were plotted in Paris. The dynamite was sent from France, while the clock-work came from abroad."

The Swiss Federal Council has decided to grant the extradition of Anarchists whenever this is asked for. Otherwise, Anarchists will be expelled from the country.

François Auguste Marie Mignet, the celebrated French historian, and the oldest member of the French Academy, both in point of age and membership, died on Monday. He was born May 8, 1796. He received his early education at Aix, his native place, and Avignon. While studying law at the former place, he made the acquaintance of Thiers, and the friendship lasted for sixty years. Mignet's 'History of the French Revolution' appeared in 1824 and was a great success. In 1830, with Thiers and Carrel, he founded the *National*, which became an important factor in the impending revolution. He became Minister of Foreign Affairs under Louis Philippe, and was elected to the French Academy in 1836. He was the author of many historical works which have become standard in France, and is said to have labored half a century on a 'History of the Reformation' which has not yet been published.

The eighty-seventh anniversary of Emperor William's birthday was celebrated on Satday in Berlin with great enthusiasm. The American Minister, Mr. Sargent, was present at a banquet in the evening.

Emperor William, on his birthday, received two splendid Sèvres vases from some person whose name was not given. The gift was believed to be from President Grévy of France. Prince Bismarck, it is said, remarked that he hoped that the day was not far distant when he would be able to make France as happy as some one had made Emperor William.

The American Exchange in Berlin was opened on Monday with a dinner. Minister Sargent, who was one of the guests, proposed a toast to Emperor William, and referred to the important increase of commercial relations between Germany and America.

Herr Witte, a Liberal, has been elected to the seat in the German Reichstag made vacant by the death of Herr Lasker.

There was a debate in the German Reichstag on Thursday on the Anti-Socialist law, which it is proposed to continue for two years longer. Prince Bismarck said this was necessary not only as a repressive policy, but as a positive measure for the benefit of workingmen. It was impossible to abandon preventive measures. The debate was continued on Friday, and the bill was referred to a committee.

The Italian Chamber of Deputies on Wednesday elected Signor Coppino President as the successor of Signor Farini. Owing to the smallness of his majority the Ministry resigned. King Humbert invited Signor Depretis, Premier of the old Cabinet, to form a new one, and he consented.

It is reported in Rome as possible that the Pope may depart from the Vatican, but the Papal journals deny it.

Count Vladimir Fedorovitch Adlerberg, the Russian general and statesman, is dead at the age of ninety. He was confidential friend, Minister of the Czar's household, and Chancellor of the Russian Orders, under Nicholas and Alexander II.

It is reported in Constantinople that the Grand Vizier of Turkey has complained to the United States Government of Minister Wallace's recent conduct.

There has been considerable excitement in Toronto during the week over the bribery of several members of the Mowat Government party in the Ontario Legislature by prominent gentlemen of the Opposition. The majority of the former is only twelve, and it is not in accord with the Dominion Government. Two members were given $1,000 and $800 respectively for their votes. They exposed the scheme, and several arrests followed. An investigation is pending both in the Legislature and in the police court.

Advices from the far East indicate that the situation of the crew of the wrecked British steamer *Nisero* is precarious. The British Cabinet are considering steps to effect their rescue. The *Nisero* was wrecked on the west coast of Atcheen, Sumatra, the 12th of last November. The vessel was looted by the subjects of the Rajah of Tenom, and the crew, consisting of twenty-five men, among whom was an American, were taken captive.

THE TRUNK-LINE POOL.

THE best index of the commercial and financial situation is the virtual break-down of the Trunk-Line Pool. What happened a few years ago, when there was no pool, and when each road was carrying through-freight at cost, or less than cost, has now come to pass in spite of the best organization we have ever had for curbing and controlling competition. The pool is still in force. It is managed by the best railway talent in the country. All the companies appear to be anxious to obey orders, to maintain rates, to be good members of the pool. Nevertheless, the law of competition has triumphed completely over the law of combination. Rates have fallen to nearly the lowest point reached during the great railroad war, and the common expectation is that they will fall still lower.

The last remedy which the pool holds in reserve against the cutting of rates has been brought in requisition. The regular or open-tariff rate has been reduced to the level of the lowest cut rate. If there is to be any further cutting, the open-tariff rate will be again reduced. Cutting will be made unprofitable at all events, but it does not follow that the cutters will be brought to repentance, or that rates will be restored. When a railway manager sees a portion of his cars and locomotives standing idle, his operating expenses and fixed charges running on, and pay-day coming around, he gets into a state of mind in which human virtue counts for little. The temptation to "shade" the rate in order to attract sufficient business to meet his payments, but not enough to excite the suspicions of his partners in the pool, becomes irresistible. But the partners are too smart to be hoodwinked. They know that something is going wrong before they can locate or describe it, and they take instant measures to hold the business which has begun to slip away from them. They reduce the rate a shaving lower than it was reduced against them, by way of punishing the known or unknown offender. The latter, finding that his game is understood, has no alternative but to cut again. He cannot go to his partners and acknowledge that he has been cheating, and then ask them to put the rates back to the old figures. He knows what kind of a greeting he would receive. Having got on the down track, there is no stopping short of the bottom of the hill. The pool is supposed now to be at the bottom, but if it is not there yet, it will go there. Rates will continue to fall until either business improves or the weaker concerns are crushed out, bought in, amalgamated, or eliminated as competing forces. The attempt, however often made, to chain the continent or any large part of it to the wheels of monopoly, will surely fail. Railway companies have to compete not merely with each other, but with all the unemployed capital of America and Europe seeking investment; for whenever their profits rise above average profits, or even if they fail to decline as average profits decline, new railways will be built. This is no mere theory. It would hardly be possible to put one's finger on the map of the United States where this law has not been exemplified and vindicated over and over again. It is now running its course at great length and heavy expense in the far West, on the borders of Salt Lake, in the mountains of Colorado, and even at the capital of the Montezumas.

One grand factor in the problems of the pool, and in the commercial and financial situation generally, is the competition of new wheat-growing districts in Asia, South America, and Australia, with our own. The railways of India compete with the New York Central as grain carriers on opposite sides of the globe as effectually as though they were parallel with it and only a mile distant. Obviously, every bushel of grain that reaches the English market competes with every other bushel. The railways of both India and America must square their charges by the selling price of the article, which is regulated by the law of supply and demand. Undoubtedly the low prices ruling in England now and for some time past have contributed much to the breaking of railway rates in this country. For this there is no help. If our supremacy in agriculture is to be maintained, it must be done by offering our grain and provisions at something less than our competitors can afford. We have gained some advantages lately by offering our wheat in the form of flour, and there seems to be a large field for the display of our enterprise here; but, as time goes on, we must look for the same aggravating rivalry in milling that we have at last found in wheat-growing. Five years, or even three years, ago nothing seemed more improbable than that there should be such a surplus of food products in the world that the price of wheat would fall to 90 cents in Chicago, and that the cost of carrying it to the seaboard would fall to 10 cents. What is even more remarkable is the fact that these reductions have not led to any increased export movement.

It has been suggested, as a last remedy against rate-cutting, that all railway earnings within the precincts of any given pool be turned into a common fund, and apportioned among the members according to an agreed ratio. We are not prepared to say that such an arrangement could not be made to work if everybody would keep hands off while the experiment was in progress. But since any railway shareholder could object to the diversion of the earnings of his property to the treasury of another company, the immediate outcome of the plan would be an injunction and a lawsuit. Such an arrangement, moreover, could in no way restrain the competition which arises from the wheat fields of India, Russia, and Australia, and which, as stated, weighs with peculiar force upon the Trunk-Line Pool at the present time. Manifold difficulties would arise from the apportioning of expenses as well as receipts. In short, the problem is too complicated to be dealt with by makeshifts. It can only be solved by great natural forces, the same which are solving it now. The only thing that can be said with certainty is that the public will get their transportation, as they get other things subject to the law of competition, at the lowest possible cost.

THE BRITISH PARLIAMENTARY FRANCHISE BILL.

SEVENTEEN years have elapsed since a change was made in the electoral franchise of the United Kingdom. It was then made under very peculiar circumstances. In 1866 the Liberal Government, in which Lord Russell was Prime Minister and Mr. Gladstone Chancellor of the Exchequer and leader of the House of Commons, brought in a bill to reduce the franchise in boroughs from the limit of £10 annual rental to £7, by which change they proposed to grant the suffrage to the upper ranks of the working class. The proposal met with warm opposition, not only from the Tory party, but also from a considerable section of the Liberals, who declared that it would swamp the rich and the educated, and endanger the country by placing the control of its destinies in the hands of a wage-earning class which they described as ignorant and reckless, likely to pursue its own interests solely, and to become the victims of profligate demagogues. The opposition to the measure was led by Mr. Robert Lowe, whose vigorous philippics against it are still remembered as having produced a sensation that has been seldom equalled and never surpassed. The conjunction of Tories and disaffected Liberals threw out the Government. Lord Derby and Mr. Disraeli came into power, and carried next year a measure, the Representation of the People Act of 1867, which, to the astonishment of the country—and most of all of their own followers, who scarcely knew what they were doing until they had done it—reduced the franchise lower than Mr. Gladstone had proposed, giving it to all rate-paying householders in boroughs, and also to lodgers, though under conditions which have turned out so awkward to work, that the number of lodger electors is comparatively small. How this was accomplished is a piece of history which is, indeed, very curious, but which need be mentioned now only for one purpose, viz.: to point out that as it was the work of a Conservative Government, the Conservative party thereby abandoned its former ground of resisting extensions of the franchise, and encouraged the formation of what may be called a Tory democracy. Since that date, therefore, the Conservatives have felt precluded from openly opposing the cry for further suffrage reforms, and are obliged, if they really dislike such reforms, to plead either that the moment is inopportune, or that various concomitant precautions are needed to prevent a very extended franchise from being abused. This fact is the explanation of their present attitude.

The Act of 1867 applied only to boroughs, so the next demand was made in behalf of county householders, and took the form of insisting that the household-borough franchise should be extended to them. It began about 1872, and has been kept up in a somewhat languid way ever since, growing stronger, however, during the last three years. The present Ministry admitted it as a thing to be done as soon as they came into office, and promised to propose it before the expiry of the present Parliament. Some pressure was put on them last autumn by their more radical

supporters in the country to lose no time in carrying it; and they accordingly announced that it would form the leading item in their programme for this session. No Liberal objected to this course. Some thought that the reform of county local government was a more pressing matter; others called for the creation of a municipality for all London. But the principle of the assimilation of the county and borough franchises was accepted as sound. At the close of February Mr. Gladstone introduced the bill, in a long speech marked by all his old skill in lucid exposition and ingenious argument. The bill is a comprehensive measure, which deals with the right of suffrage in boroughs as well as in counties, simplifying the law, and providing for a class of occupants who had been omitted from previous acts. Stripped of technical details, it establishes a uniform Parliamentary franchise through England, Scotland, and Ireland, under which every householder paying local rates will be entitled to vote, and about 2,000,000 voters be added to the 3,000,000 who now enjoy the suffrage. Its practical effect will be, as regards England and Scotland, to admit both the agricultural laborers in the rural districts, who have hitherto (except where they lived within the limits of three or four large boroughs, which were really rural districts) had no vote, and also the working classes in the mining and manufacturing districts, and in the counties lying round London.

The principle of this enfranchisement is not contested. The Liberal party, with the exception of Mr. Goschen, has been long committed to it. The Conservatives cannot offer direct opposition to it, partly because they are hampered by their own action in 1867, partly because they do not like to appear hostile to or distrustful of that great mass of working people whom the bill seeks to bring within the pale of the Constitution. But they are unwilling to see it pass, and will endeavor to defeat it; while there is a section of the Liberal party which, without being positively hostile, regards the change with apprehension.

Their chief alarm relates to the effect of the bill on Ireland. At present the suffrage is in that country much more restricted than in England, so that not only will many new county voters be added, but a great number of borough voters who are below the present English and Scotch limit. In fact, Irish constituencies will become new bodies altogether. The lower one goes in Ireland, the larger becomes the proportion of Roman Catholics and Nationalists, so that the bill must strengthen Mr. Parnell's party in both boroughs and counties, and by consequence in the House of Commons. As regards the counties in the West, South, and West Centre of Ireland, the difference cannot be very great, because these counties either already return Parnellite members, or will do so at the next election even if it be held under the present franchise. But there are some counties, such as Dublin or Armagh or Leitrim, in which the lowered franchise will greatly strengthen the Parnellites. In the boroughs this result will be more marked. Nearly all of them, except Belfast and one or two others in the North, will fall into Nationalist hands. If a general election were now to take place, Mr. Parnell would probably come back at the head of nearly seventy members out of the whole number of 106. If it were to take place under the extended franchise which the bill proposes, he might win another fifteen seats, and have more than four-fifths of the Irish representatives serving under his banner.

This effect, and the aggravation of the difficulties of governing Ireland which it seems to threaten, is regarded by the Tories as a reason against proceeding with the bill. Either, they say, let it apply to England and Scotland only, or else postpone it till a better opportunity, when Ireland has been thoroughly pacified, and coercive legislation is no longer necessary. The objection to the first alternative is, that to omit Ireland would not only convert the Irish members into implacable opponents of the bill, but would be inconsistent with all the professions which the Liberal Ministry has been making of its resolve to do equal justice to Ireland. The objection to the second is, that the Ministry has absolutely pledged itself to the unenfranchised classes of England and Ireland, and cannot recede with honor. In these circumstances the uneasy Liberals, who see that the bill must go on, and that it must include Ireland, suggest that at any rate some steps ought to be taken to mitigate its dangerous effects there, by devising a system under which the loyal and educated minority in Ireland shall not be left almost wholly unrepresented. In England and Scotland there are so many differences between one constituency and another that every party is pretty sure of a fair hearing, and no party becomes so powerful as to trample on the others. But in Ireland county constituencies and borough constituencies are so like one another throughout the three Roman Catholic provinces that the Protestant minority will be extinguished. If Irish constituencies were large, so that for several of them three or more members might be allotted, the plan might be adopted under which, in England, a constituency with three members returns two members representing the majority and one representing the minority; no elector being allowed to vote for more than two candidates. But in Ireland no constituency has more than two members.

SUMMER HOMES.

THE spring in town is a depressing season all over the world, and in no city more so than in New York, where its recurrence involves the search for a "summer home." This cannot be put off later than March, and many prudent people think that midwinter is none too early to be looking about for a place to pass the summer in. We are not speaking, of course, of the very rich, the people who have country seats and yachts, but of the great mass of people of limited means, who have to remain during the summer near the shop, store, broker's or lawyer's office, which constitutes the source of the family supplies. Among this great class the summer-home problem casts a gloom over a large part of the year, first, in the anxious canvass of the advantages of the various homes that are offered, then in the discomfort and misery attendant upon the occupation of the one that is selected, and finally in recovering from the effects of occupying it after returning to town.

There are one or two points with regard to the selection of a summer home that are frequently overlooked, and we are sure that our readers will be glad to have their attention called to them. The first is that nothing is gained by inquiries about malaria. It used to be thought that certain districts in the United States were malarious, and certain other districts free from it, and, as long as this belief prevailed, the owners of houses in the suspected regions always had, when interrogated, a guilty look, or else an air of brazen composure by which the presence of malaria might be detected even while they were engaged in boasting of the healthfulness of the spot; just as we used to be able, during the war, to detect treason in the glance of a peace Democrat even while he was vaunting his devotion to the Union. The scientific researches pursued in the last twenty years on the subject of malaria have resulted, however, fortunately or unfortunately, in discovering it everywhere. In the most salubrious valleys, on the tops of the loftiest mountains, on the sandy sea coast, and far away from it, in New England as well as in New York or Illinois, the germs of this fearful pest are found by Science, and so widespread has the dread of it now become that we have known it to prevent an owner of property from getting tenants in a New England village where there had not been a case of malaria from the time of the earliest settlement.

The scientific discovery that malaria exists everywhere has greatly emboldened the owners of property in the old suspected districts, and enabled them to take a new line in reply to questions on the subject. They no longer deny impudently that there is any reason to fear malaria, nor stammer and hesitate in their answers, but, with a look of patient superiority and compassion for the ignorance of the inquirer, they remind him of the unquestionable fact that malaria is said to prevail on the shores of the Hudson and the Sound, on Long Island, in New Jersey, in the city itself, and that the particular town in which he is searching for a "home" is not entirely free from it. The fact is, they go on, on the other side of the railroad track there have been cases, caused no doubt by the construction of the road; but elsewhere there has never yet been any malaria. Of course, they continue, with a steady look in the eye of the inquirer, families coming from malarious districts may bring the germs of malaria with them, and it may break out after they get into a pure bracing air like that of Mudview; of course such an accident as this would only make the evidence of the healthfulness of the place still stronger. There is no way of meeting such an argument. We have known a person whose fingernails were blue with ague, and who was shaking all over—owing, according to his own account, to some fish he had eaten for breakfast—crudely to deny that he had ever had a touch of malaria; but this was a generation ago; if he is still alive, he probably now explains it by declaring that he got it somewhere else, and that it had been brought

out by the healthiness of the air in his new home. The moral influence of malaria in stimulating mendacity and invention is one of its most marked features, and an eye for a non-malarious summer home is like an eye for a horse, only to be got by much experience and some suffering.

The matter is complicated still further by the fact that the owner of the summer home never wants the place as a summer home for himself. Healthy it is, and cool, free as any home from malaria and mosquitoes, in the midst of a smiling country, abounding in excellent roads, fanned by bracing breezes from the hills or the sea, as the case may be—a spot full of charm and attraction, and within easy reach of town by rail or water; yet for some inscrutable reason it is, at the very season when these advantages are at their height, to let. The reason is that the owner, if the home is inland, always happens to prefer the seaside; if on the seashore, he always likes to go into the mountains—a most singular fact when you reflect that the place was originally selected by him as his own summer home. His position is very different from that of an old-fashioned boarding house keeper, who, at least, vouched for the fitness of the place for human habitation by living in it himself. The longing of the proprietor of the summer home to put some one else in it during the summer, breeds distrust and suspicion, which he only partly allays by the enormous price he asks for it. His feeling evidently is that, if he asks enough, the applicant will begin to think that his stories about the place are true, just as the venders of candy recommend it to women and children by labelling it "high-cost bon-bons."

In this way we reach the extraordinary economic result that the rent of a summer home, for the time occupied, is just as great as that of a winter home in the city, and this although the owners of the summer homes are all anxious to let them, and do not like to live in them. If Adam Smith was not an arrant impostor, this must be because there is an extraordinary demand for such places, which it would be worth the while of the enterprising capitalists who are engaged in "developing" the country about New York to consider.

A CURIOUS HISTORY.

A PARAGRAPH in the daily press states that the Trustees of St. Patrick's Cathedral have obtained from James Doyle, of Boston, a quitclaim deed to the Cathedral property, comprising the two blocks of ground bounded by Fourth and Fifth Avenues and Fiftieth and Fifty-first Streets. Why John Doyle should be asked to give his quitclaim to one of the most valuable tracts in the city of New York, appeared to be worth inquiring, especially in the light of the commonly-received opinion that the city of New York had once conveyed this property to the Catholic Church for the nominal consideration of one dollar. Being moved to look into this history, we have come upon two facts of very considerable interest, which will be narrated in their order.

The first is, that the Cathedral property was never given by the city of New York to the Roman Catholic Church at all, but was bought by the Cathedral Trustees through an agent at a foreclosure sale in the year 1828 for the sum of $5,500 cash, the foreclosure having been made at the suit of the Eagle Fire Insurance Company against Dennis Doyle. To go back to the beginning, the land in question was part of the "commons" of the city of New York. It was conveyed by the municipal authorities to one Robert Lylburn on the 1st of May, 1799, for the sum of 405 pounds sterling, subject to a quit-rent of four bushels of wheat per annum. In the year 1810 Lylburn conveyed it to Francis Thompson and Thomas Cadle. In the same year Thompson and Cadle conveyed it to Andrew Morris and Cornelius Heeney, and the latter grantees mortgaged it to the Eagle Fire Insurance Company. On the 22d of May, 1821, they conveyed it, subject to the mortgage, to Dennis Doyle. The Eagle Fire Insurance Company foreclosed their mortgage, and sold the property under a decree of Chancellor Walworth at public auction on the 3d of November, 1828, and it was bought by Francis Cooper for the sum of $5,500. Cooper then conveyed it to the Trustees of St. Patrick's Cathedral, reciting in the deed that he had bought it at the sale as the agent of said Trustees. The property remained subject to the quit-rent of four bushels of wheat per annum until May 13, 1852, when the city of New York gave a quitclaim deed to the Cathedral Trustees for the consideration of one dollar. It appears that this latter deed had no other force or effect than to release the Trustees from the wheat rental, which was of a nominal character altogether. The title was already in the Trustees; the city had been divested of its title more than half a century before. Nevertheless, the story has gone around the world, and is probably believed by nine-tenths of the inhabitants of New York, that a lot of corrupt politicians controlling the city government, in the year 1852, in order to secure Irish Catholic votes, made a donation to the Church of this valuable ground. It is a pity to spoil so apt an illustration of the depravity of our rulers and the rapacity of the priesthood. We are reluctant to part with it, but we see no present means of retaining it. We pass it along to keep company with the tales of William Tell and the apple, of Pocahontas and John Smith, and other Phœnix-like delusions which rise from their ashes as often as they are put to death.

The second part of this curious narrative is not less surprising. It shows how the sum of $700, arising from the sale of the Cathedral property in the year 1828, as a surplus after satisfying the claims of the mortgagees and certain judgment creditors of Dennis Doyle, was bandied about from one public officer to another till the latter part of the year 1882, when it had grown, under the fructifying breath of compound interest, to the amount of $17,000, and was then paid over to an obscure laboring man named James Doyle, of Boston, Mass., grandson and only surviving heir of Dennis Doyle aforesaid. The record in this case shows that Dennis Doyle disappeared from New York before the foreclosure sale took place in 1828, and that the surplus money was left in the custody of the Assistant Register in Chancery, and was invested, accumulated, and reinvested by him and his successors in office until the 5th day of July, 1847, when, under a change of the law applicable to such funds, it was transferred to the custody of the Clerk of the Court of Appeals. Under a law subsequently passed it was retransferred to the County Treasurer of Richmond County, by whom and his successors in office it was invested, accumulated, and reinvested, always on bond and mortgage, until a couple of years ago, when a mousing lawyer had his curiosity excited by it, and put an advertisement in the papers inquiring for the heirs of Dennis Doyle. After some months of diligent search, in the course of which a good many wrong Doyles were started from cover, the right one was found in July, 1882, in the person of the aforementioned James. A proceeding was instituted in the Supreme Court of Richmond County to recover the surplus money and its accumulations. Upon the trial of the cause it was proved conclusively that James Doyle was not only a lineal descendant of Dennis Doyle, but the only surviving one of several. The assets, consisting of bonds and mortgages, and accumulated interest, amounting in all to about $17,000, were accordingly adjudged to belong to James Doyle, and were paid over to him. The most surprising feature of this branch of the history is not that James Doyle should have been found, but that this money should have been "lying around loose" for more than half a century unclaimed, passing through the hands of many officials of different grades, and yet that no part of it was ever lost, stolen, misapplied, or even badly invested, but was at all times in readiness to be delivered to the rightful owner, and was at last paid to him with its large accumulations of compound interest.

THE SOCIAL MOVEMENT IN ENGLAND.—III.

LONDON, March 6.

ANY of your readers who may happen to be interested in the subject of these letters* would do well to read with care Mr. Herbert Spencer's denunciations of "the new Toryism," and also the recent debate in the House of Lords on the Commission for Inquiring into the State of the Dwellings of the Poor. No two men are more different from each other, in intellectual gifts and in moral feeling, than Mr. Spencer and Lord Salisbury. Yet, oddly enough, the speculations of the philosopher and the speech of the Tory leader both tell the same tale: from the writings of the one, as from the words of the other, you may safely infer that (to use an expression borrowed from your ingenious correspondent) the "decline in the doctrine of laissez-faire" is a marked feature in the present condition of English opinion. In a former letter I pointed out that a belief in the benefits to be derived from state interference, or, in other words, the unpopularity of the doctrine of laissez-faire, was one of the sentiments or ideas which lay at the basis of the social movement in England. My sole object, in the present letter, is to account for a remarkable change of opinion.

The discredit into which the dogma of laissez-faire, and with it a whole body of economical doctrine, has for the moment fallen, is due to the combined influence of three different causes.

First. The formulas of political economy are, of all the principles which concern the conduct of life, the hardest for educated men, and still more for uneducated men, to grasp with a firm hold. The so-called "laws" of economical science are in reality descriptions of certain permanent tendencies. The rule that men will buy in the cheapest and sell in the dearest market, though it lies at the foundation of all commerce, does not constitute an inflexible law, subject to no exceptions, but is rather the expression of the way in which men, in so far as they pursue the principles of trade, tend, and must tend in the main, to act. Now, the most difficult thing for all men at many times, and for most men at all times, is to realize what is meant by a "tendency," or, to put the same thing in a slightly different form, what is the meaning of a rule which prevails generally, though subject to some real and to many apparent exceptions. A very slight acquaintance (and I have no right

* See the *Nation*, Nos. 967, 968.

to pretend to more than a slight acquaintance) with economical speculations, will convince any candid student that economists themselves have found it hard always to keep clear in their own minds the exact nature of the rules which make up economical science. The moral and intellectual temptation to treat maxims which you know to be true in more than ninety-nine cases out of a hundred, as laws admitting of no modification, has certainly not always been resisted by the exponents of economical doctrine or by the advocates of economical reforms. The greatest and most beneficial triumph of political economy has been the establishment of free trade, and there is great danger at present lest the world should underrate the debt we owe to free-traders such as John Bright. But, from a speculative point of view, the heroes of the Anti-Corn-Law League have damaged their own cause. To teach men to consider doctrines as absolutely true which are true only with certain limitations, is the readiest and the necessary method of converting abstract theories into practical reforms. But one evil of this method is, that the time comes when every one perceives that doctrines supposed to be absolutely true are true only subject to certain limitations; and it is very well for the world if the popular conviction that doctrines which have been accepted as dogmas need certain speculative limitations, does not lead to the delusion that beliefs true enough in the main are essentially false. This is what seems to have happened as regards many maxims of political economy. Bastiat, or Herbert Spencer, writes of laissez-faire as if it were a sort of absolute truth, as little open to limitations as the truths of mathematics. Ingenious thinkers like Bagehot point out to every thoughtful person that no economical, and one may say no political, truth has this character of rigid, absolute certainty. The result is that thousands, educated or uneducated—such, for example, as Lord Salisbury—who are not thinkers at all, come to fancy that the perfectly sound doctrine, within due limits, of laissez faire is an "exploded idea."

Nor is the difficulty of grasping the nature of rules which describe permanent tendencies rather than an invariable course of action, the only impediment to the maintenance of sound economical faith. The true hindrance is, that every important truth of political economy is a paradox. "I like to see the great chimneys smoking," was, it is said, the reply of Thiers to all the arguments adduced against the protection which kept up French manufactures. He saw the one fact which lay on the surface, namely, that free trade would abolish the manufactures which can be more easily carried on elsewhere than in France. He did not see all the incalculable gain which France herself would obtain by the due application of her own labor. What is true of protection is true of charity, of expenditure on luxuries, and the like. In each instance science teaches a doctrine which is opposed to appearances. It teaches us, in short, to look to what is unseen and therefore eternal, rather than to what is seen and therefore temporary and delusive. But this, the real strength of political economy, is, as regards its hold on the ordinary imagination, its weakness. What, in truth, requires explanation is, not that the majority of Englishmen should become sceptical as to the validity of doctrines which are opposed to all the natural prejudices, to all the "idols" of the human intellect, but that a whole nation should have seemed, during a generation, to have adopted scientific truth for the guidance of practical life.

The explanation of this marvel is obvious. The success of free trade was one of those palpable, so to speak, tangible facts which go for more even than they are worth. Ordinary Englishmen adopted, or thought they adopted, the speculative conclusions of Adam Smith and his followers, because Englishmen felt that actual experiment had demonstrated the validity of conclusions which few Englishmen would have adopted as long as they claimed assent merely on the ground of their inherent reasonableness. Seeing was, in short, believing; but faith which rests upon sight is not faith at all, and convictions based, as far as the populace were concerned, on the success of one great experiment are necessarily shaken by any change of outward circumstances. Never did free trade benefit a country more than it has benefited England throughout the last ten years. But a period of less than our ordinary prosperity has made men begin to doubt the wisdom of that very course of policy which has alone prevented lessened prosperity from turning into actual ruin. Thousands of Englishmen, in short, believed in free trade without understanding the logical grounds of the belief that was in them. The palpable fruits of free trade and the practices which went with it have been less striking than they were some ten or fifteen years back. Immediately half the enthusiasts for free trade and laissez-faire have begun to suspect that their economical creed itself was unsound. This is just the state of national feeling in which all the old arguments or fallacies which have from time immemorial been deduced in favor of state interference naturally rise up like ghosts from their grave, and are found to come back and to haunt the minds of all that ignorant and illogical class who, whether peers or commoners, are known as practical men of common sense.

Secondly. A change in social life, very characteristic of the age, has given to many of the maxims of political economy an appearance of being out of date. This change is the immense increase in the number of corporate bodies, and especially of corporations such as railways, which, from the nature of things, constitute more or less of monopolies. Now, the teaching of the older political economists, though in principle applicable to corporations no less than to individuals, undoubtedly contemplated a state of society in which one individual A should bargain with another individual B, and in which everything should be regulated strictly by individual competition, and took little account of corporate feelings and of the kind of monopolies which, in many cases, are produced by the existence of corporations having exclusive rights over definite portions of land. The result has followed that the form in which economical truths were expressed by Adam Smith, or Ricardo, or M'Culloch, is often hardly applicable to the transactions of modern life; and when the practical maxims in which theoretical principles are embodied are seen to be inaccurate, mankind are apt to fancy that the principles themselves are untrue. Nor is this the only result of the development of corporations. There are many cases where the choice of the public lies in reality not between laissez-faire and governmental interference, but between the interference of the state and the despotism of corporate bodies. Every one can see that, for example, as regards railways, the question for the public to consider is, whether it is better for the nation that the great highways of the country should be in the hands of the Government, or in the hands of two or three huge monopolists, who will find it their most gainful course to exclude competition by a system of combination. It is vain to trust to the energies of individuals where an individual has to compete with an artificial personage who has a thousand times the resources of the richest man in England. On the debated question whether the existence of corporate monopolists is a valid ground for placing the Government at the head of large business concerns, I express no opinion whatever. What I do insist upon is, that the existence of large companies does to a certain extent lessen the force of the argument in favor of laissez-faire, and, what is of more consequence for my present purpose, is one of those facts which attract popular attention. Their experience of railways has, it may be conjectured, converted hundreds of Englishmen to a belief in the benefits to be gained by the intervention of the state in matters of business.

Thirdly. Moral feeling has, as is usually the case in England, and (I conceive) also in America, had more to do with the discredit of laissez-faire than either speculative reasoning or plausible inferences from the actual experience of modern life. The predominant sentiment of the day is, as I pointed out in my first letter, one of pity for the miseries, and especially the physical miseries, of the masses. Sympathy lies very near to indignation, and compassion for sufferings which individuals feel themselves powerless to avert, makes it to many persons seem an intolerable injustice that these sufferings should exist. But the natural opponent of injustice is the power of the state. It is therefore all but inevitable that persons who consider the poor to be wronged by the fact that they are poor, should demand the intervention of the Government on behalf of the mass of the people. The same point may be put in another light. Reformers bent on removing great evils find it in general impossible to acquiesce in the notion—which is often, however, a true one—that no specific cure for a definite evil exists, and that the best that can be done is to leave men free, in the hope or expectation that a series of individual efforts will by degrees remove or lessen the worst defects of society. Now, given the assumption that some power exists capable of remedying directly all great social diseases, it soon becomes palpable that the only power which can conceivably be available for the achievement of great social improvements is the state. Reformers, in short, believe in the intervention of the Government, not in reality from a well-grounded conviction that governmental interference can achieve tasks of infinite difficulty, but because the power of the state is the only conceivable *deus ex machinâ* capable of cutting through the knots which ardent reformers know they have not the skill to untie or the power to cut through. The current and exaggerated belief in the power of the state is, in fact, a sign and a result of the growth of sympathy.

A. V. Dicey.

THE ENGLISH IN EGYPT ON THE ENGLISH IN ENGLAND.

Cairo, March 6, 1884.

We in Egypt sometimes think, not to say flatter ourselves, that we are somewhere about six months ahead of our friends in England in the views we hold of English policy in Egypt. It is wonderful what an amount of practical unanimity there is, and has long been, among Englishmen here as to the course which it behooves England to take. This unanimity is not confined to the merchants at Alexandria, whose clear and absorbing commercial interests might naturally lead them all to think one way; but in the Cairo world, where all the conflicting tendencies of English political life are fairly represented, there is to be found only a trifling divergency of view. It is very rare to meet any one who would favor the instant annexation of Egypt; and it is equally rare to meet any one who does not invoke the most absolute and authoritative influence of England in all

Egyptian affairs, or who would, even in imagination, fix any limit of time at which that influence ought to be withdrawn.

The criticisms on the recent proceedings in Parliament afford a good example of the different attitude of the English Liberals in England and of English Liberals in Egypt. Throughout the English debates, the leading Liberals and leaders of Mr. Gladstone's Ministry have constantly assumed an apologetic tone in speaking of the English intervention in Egypt. In the last debate, indeed, they have spoken little, if at all, of an early withdrawal, and have even ventured to allude to the permanent presence of English influence; but everywhere there are unmistakable tokens of the dislike which the Liberal party have, as a party, to the English occupation, and of the sanguine view they take of the actual progress being effected in Egyptian reforms. Mr. Goschen, indeed, who, like Mr. Forster, acted as a candid friend of his party, pressed the Government to discriminate between reforms as measured by statistics and reports, and reforms which were vital enough to endure if the support of England were withdrawn. A few only of the speakers, such as Mr. Goschen himself, have any real knowledge of the true obstacles to beneficial change in all Oriental, and especially Mohammedan, countries; and of those who are well informed on this point, there is scarcely one besides Mr. Goschen who commands respect as a practical statesman. The result is that, but for the glaring calamities which have called for a reinforcement of English authority in Egypt, it is probable that the abstract dislike to foreign enterprises, which was a natural reaction against the turbulent insanity of Lord Beaconsfield's imperialism, would have carried the day. Instead of the evacuation of Cairo, the Mahdi's victories in the Sudan have compelled England to undertake what is practically a second war on Egyptian soil. The indirect consequences of this call for renewed activity have been still more signal. The long debate in both houses of Parliament exhibits the spaces of thought which have been travelled over in a few weeks by the whole English people. Nothing but the rapid change of front of the Government could probably have saved it from disaster. At the present moment the English Government and their supporters in Egypt are far nearer together than they have ever been before, and it only needs a few more calamitous break-downs in the fictitious native administration which is still being propped up here, to make advanced reformers in England and in Egypt absolutely at one.

It is from no imperialistic tendencies or foolish pride in the extension of the English name and fame that Liberal English politicians in Egypt call for the most energetic and avowed exertion of English authority. It is only in the interests of the true people of Egypt themselves, and in the pursuance of exactly the same ends as those which Mr. Gladstone's Government loudly and consistently professes to keep before them. Diplomatically speaking, England cannot leave Egypt at this moment. If England's work of establishing native government on a firm and lasting basis is never done, England can never leave. But every Englishman here knows well enough that the establishment of native institutions with independent vitality in them has proceeded as yet only in outward form. It will take a new generation to grow up, under a new state of things, before the experiment of how this state of things will last can be so much as tried. To an Englishman at home, even of the rudest and simplest condition, impatience with his lot, desire of self-improvement, and belief in the possibility of things being made better for him, whether by his own exertions or by the exertions of others, are as natural to him as the English air he breathes and the English language he speaks. They are the product of eighteen centuries of Christianity, and of some eight or ten centuries of the English Constitution. Even the ruling classes in England only indicate their existence by devoting themselves to the cause of public improvement. In Egypt the ruling classes, with the exception of a few of their members who might be counted on the fingers of one hand, are slothful, ignorant, selfish, and sublimely indifferent to the progress of themselves or others. This is at the best. At the worst, they themselves constitute the first object which a reformer would wish to reform away. The people are only saved from the infirmities due to generations of serfdom by an amount of Mohammedanism which prevents them from being patriots and keeps them fatalists.

Till these conditions of the problem are mastered, Englishmen in England never will be able to translate English political institutions and ideas into Egyptian terms. Of course it is well to introduce courts of justice which will be free from the gross blots of corruption that rendered the late administration of justice such only in name. It is well to compel Egyptians to learn the art of voting and to have formally inculcated upon them the fact of political responsibility. It is well to create a native army, the bands of which can at least play European tunes, and which, if never brought into the field, will be safe not to run away. But as yet neither the heart nor the mind of the nation itself is touched by any one of the reforms which have been inaugurated. Mohammedan fanaticism, said to be excited by the Mahdi, is arresting an attempt even to deal with the slavery question. No movements but the voluntary ones of the eminent American missionaries are grappling with education on any scale commensurate to the purpose. The obliteration of women, even in the families of Coptic Christians, is still treated as a divine institution. The only reforms that have made any way, such as the improvement of the prisons, are social rather than political, and relate to work which in other countries has been mainly set on foot by private philanthropists.

It might be thought that the prospect thus opened out is not a cheering one; but the fact is, that the only disheartening circumstances are where too sanguine a view is taken of the early resurrection of Egypt from its sleep or death of ages. As England begins really to feel how worthless are superficial reforms in Egypt, there is no doubt she will brace herself afresh to undertake a longer and harder task than she has yet had the courage to contemplate. It is not a question as to whether Egypt is to be independent or to belong to this country or that, to be annexed, protected, or advised. The question is, whether the true and indestructible life of the people is to be called out by securing years and years of just and blameless government, or whether all the money, blood, energy, time, and sentiment of England already expended on Egypt is to be thrown away. A.

Correspondence.

THE SECOND AND THIRD ARMY CORPS.

To the Editor of The Nation:

Sir: In behalf of many thousands of former soldiers, allow me to protest against a perversion of military history which Captain Phisterer has committed in his so-called 'Statistical Record,' forming a volume of the Scribner series.

On pp. 55–61, inclusive, Captain Phisterer gives what purports to be an official account of the organization and history of the several army corps, twenty-five in number, besides the cavalry corps. I will not undertake to criticise the statements concerning other corps; but as regards the Second and the Third Corps, this account is grossly erroneous. Let me take the Second Corps in illustration of the kind of errors committed. The following is Captain Phisterer's record:

"Second Army Corps.
(Trefoil.)

"August 12, 1862, the troops of the Shenandoah Department were to constitute the Second Corps, under command of General Banks.

"September 12, 1862, the President ordered that this corps should be known hereafter as the Eleventh; and that the corps arranged in General Order No. 101, of March 13, 1862, Headquarters Army of the Potomac, as the Second, should be known as such.

"June 28, 1865, Discontinued."

Here it is asserted that there was no officially-designated Second Corps until the 12th of August, 1862, certain reports emanating from the Peninsula of Virginia to the contrary notwithstanding. The troops who, under the heroic Sumner, were contending at Fair Oaks, at Gaines's Mill, at Glendale, and at Malvern Hill were a set of impostors. The title "the Second Corps," it appears from Captain Phisterer's account, was first properly used on the 12th of August, 1862, when it was applied to the command of General Banks! That title was, on the 12th of September following, taken away from Banks's command, and bestowed on the vagrant and orphaned body of troops then moving into Maryland, under the command of Sumner, to repel Lee's invasion.

Now, in direct opposition to this, I assert that the divisions of Richardson, Sedgwick, and Blenker (the last was soon afterward detached) were, on the 13th of March, 1862, by order of the President, organized into the Second Army Corps; that the corps so organized had a continuous existence, under that name, until June 28, 1865, when its shattered regiments were disbanded, with the right to inscribe more than thirty considerable battles upon their banners. We will not allow Captain Phisterer to whistle away our existence as a corps, under our own proper name, between March 13 and September 12, 1862.

Captain Phisterer altogether mistakes the purport of the President's order of August 12. That order did not constitute General Banks's command the Second Corps, but only *the Second Corps of the Army of Virginia*, afterward to become the Eleventh Corps in the armies of the United States. This is in terms stated in the President's order of September 12, as follows:

"War Dept., A. G. O.,
Washington, Sept. 12, 1862.
General Orders No. 129.

"The President directs that the First, Second, and Third Corps of the 'Army of Virginia,' announced in General Order No. 103, be hereafter designated as the First, Eleventh, and Twelfth.

"The several army corps will now stand as follows: The First, Second, Third, and Fourth, as arranged in General Orders No. 101, of March 13, 1862, from the Headquarters, Army of the Potomac," etc., etc.

The utmost that could possibly be said in defence of any part of Captain Phisterer's statement would be that between March 13 and September 12, 1862, General Sumner's command was the Second Corps of the Army of the Potomac, while General Banks's command was, between August 12 and September 12, the Second Corps of the Army of Virginia, neither having the right to bear the title "the Second Corps." But even this would not be justified on any proper principles of interpretation and con-

struction. The succession of facts was as follows:

On the 13th of March, 1862, the system of army corps was instituted. The following is the first order naming army corps:

"Hd. Qu. Army of the Potomac,
Fairfax C. H., Va.,
March 13, 1862.

General Orders No. 101.

"In compliance with the President's War Order No. 2, of March 8, 1862, the active portion of the Army of the Potomac is formed into army corps as follows."

Then follows the designation of army corps No. 1 to No. 5. On the 17th of July, 1862, Congress passed an act the purport of which Captain Phisterer has misapprehended. He says this act "legalized and allowed the organization of troops into army corps, and under this authority the following corps were organized," etc. Now, this was not the substantive part of the legislation of July, 1862, relating to army corps. By his powers as Commander-in-Chief, the President had from the beginning possessed all the authority needed to create army corps, as fighting and marching bodies, or for administrative purposes, just as fully as he had authority to create divisions or brigades; and this authority the President had rightfully exercised in the order just recited. But the President had no power to appoint a special staff for the army corps he might create under his authority as Commander-in-Chief. It was to meet this need that the legislation of July 17, 1862, relating to army corps, was had. It provided that each corps established by the President might have four departmental officers with the rank of lieutenant-colonel, an aide-de-camp with the rank of major, and two aides-de-camp with the rank of captain.

Antecedent to this provision, and properly introductory to it (inasmuch as army corps had not theretofore been known by that name to the law), is the following: "That the President be and he is hereby authorized to establish and organize army corps according to his discretion." Captain Phisterer seems to interpret this as signifying that, prior to the date of that act, the President had no authority to organize army corps. He might just as well infer, from the last of the thirty-two acts confirming Magna Carta, that the right to the free election of Bishops did not exist before Henry IV., or that the use of the writ of *Præcipe* had never before been limited. The President had always possessed the authority to form army corps, under his general powers as Commander-in-Chief; the act of July 17, 1862, gave a statutory sanction to this right, and thereupon provided the special staff needed to make the corps organization most effective. The President's designation of Sumner's command as the Second Corps, March 13, 1862, held good unbroken from that date to June 28, 1865.

But even were it conceded that Sumner's command was from March 13, to Sept. 12, 1862, only the Second Corps of the Army of the Potomac, while Banks's command became the Second Corps of the Army of Virginia, Aug. 12, with what propriety can it be claimed that the latter had, at any time, the right to the designation of "the Second Corps," or to wear the trefoil? If Sumner's command was not "the Second Corps" before Sept. 12, 1862, much less was Banks's, for Sumner's command had been much the earlier organized as a marching and fighting body. This President Lincoln fully recognized in the order of Sept. 12, 1862. Sumner's command remained the Second Corps, as it had been declared by the President in March; while to the "Second Corps of the Army of Virginia" was assigned a later number.

Capt Phisterer is equally in error respecting the Third Corps, which he makes out to have been organized under the command of General McDowell, Aug. 12, 1862, in entire disregard of the body of troops which was commanded by Heintzelman, which was designated in the President's order of March 13, 1862, and which participated, under the title of the Third Corps, in the great battles of May, June, July, and August: the noble corps of Kearny, Hooker, Sickles, Birney, and Berry. Francis A. Walker.

Boston, March 17, 1884.

A SUGGESTION.

To the Editor of The Nation:

Sir: A recent visit to Bermuda has persuaded me that a small portion of your valuable space might not be wasted in calling attention to some economic features of its local administration, which have produced to the inhabitants valuable and permanent results at a trifling expense.

These islands, now connected into one by permanent and solid causeways, constitute the summit of a great submarine mountain somewhat higher than Mont Blanc, and some 600 miles distant from any other land. The land area is nineteen and one-fourth square miles, or about 12,378 acres, of which 2,300 acres are under tillage. The construction of its rocks and the derivation of its vegetation, birds, and insects, afford some interesting and suggestive illustrations of modern views on those entertaining subjects. Its settlement was nearly coincident with that of Virginia, although its population of 761 per square mile far exceeds that of Virginia or of any other rural part of the adjacent continent.

The aggregate population (exclusive of sailors and soldiers) is 14,650, of which 60 per cent. is colored, but, owing to a £60 freehold qualification, the whole number of legal voters is 854. Hence the representative body, as well as all administrative functions, is in the hands of the most respected, tax-paying citizens.

The general revenue—as distinguished from the post-office and light-house surplus—is about £30,000, derived entirely from a specific duty on spirits and tobacco, and a trifling ad-valorem duty of 5 per cent. on all other importations. The entire incidence of this taxation, compared with our 50 to 100 per cent duties, and our vast direct general and local taxation, is absolutely inappreciable and imperceptible. From this general revenue is maintained the entire legislative and judicial and a fair proportion of the executive machinery, excellent municipal conveniences in the two towns of Hamilton and St. George, a general island police, and the efficient maintenance of over ninety-five miles of roads and streets, exclusive of the sixteen miles of military roads—which are also open to public use, but maintained by the Imperial military authorities.

It is the streets and roads, and their economic construction, which are especially interesting to Americans, who have only got a step beyond savage tribes in the making and maintenance of public highways, although we spend somewhat more upon them than the richest and most perfectly supplied European nations. The Bermuda roads, though penetrating a very uneven and undulating surface, are graded almost to the capacity of railroads, shrinking from no "rock cuts," or expensive "fills," or solid causeways, to obtain this result. Most of the heaviest work of grading, draining, and metalling (they are all metalled) was done by borrowing long-term convicts from the mother country. The heavy fortifications belonging to the Imperial Government were mainly constructed in the same manner—that is to say, at no expense except transportation, since the convicts had to be subsisted somewhere. A view of these vast constructions, effected almost without expense, and yet stupendously costly, and politically demoralizing if done by our methods, leads me to make a suggestion which, indeed, has provoked this communication.

Our sea coast defences, which have cost many millions, are now said to be obsolete and worthless, and our shores without real defence. We are painfully aware that under our system, in the absence of a reformed civil service or any other modern guarantees of administration, we cannot reconstruct them, any more than a navy, without great—well, let us say *waste*. Yet every State in our Union possesses, inside and outside of its jails, thousands of healthy convicts, supported on the taxation of honest industry, and whose indoor labor is supposed by the latter to affect it injuriously. Why should not the General Government hire these convicts from the States, for their custody, and food, and a small daily sum, and use them as the British Empire has done, viz.: to lighten the burdens of its honest population by constructing roads, forts, and other public necessities, wherever they are needed?

Not only their innumerable colonies, but the British Islands themselves, bristle at every entrance and on every headland with stupendous works of defence, which have cost nothing to the taxpayer either directly in taxation or indirectly by competition with honest industry, but have been almost entirely constructed by the penal labor of those who had elected to live at war with the community.

Cannot we do as well? I. J. W.

Philadelphia, March 22, 1884.

FLOODS AND DRAIN TILES.

To the Editor of The Nation:

Sir: The communication on "Floods and their Causes," in your paper of February 28, is a good example of the way in which meteorological phenomena are so easily explained by a large class of reasoners. The earliest instance that I recollect is the famous Tenterden steeple, believed to be the cause of the Goodwin sands in the English Channel; for before the steeple was built there were no sands, and, of course, its erection brought about the sea flood that destroyed Earl Godwin's property. To come down to modern times, we find that the increased rainfall in Utah is due to the few hundred or thousand apple trees set out by the Mormons. The droughts of Illinois are in consequence of tillage and the breaking up of the land on an extensive scale, for in a prairie country they cannot be attributed to the destruction of the forests. In Kansas, on the other hand, where it is asserted the rainfall is increasing, it is believed that tillage brings rain. I have heard, too, in our great deserts, that railroads affect the climate—"the rails carry electricity, you know." Lastly, we are told that the great floods lately prevailing over such an immense territory, including Southern California and even Arizona, were due to the fact that tile draining is becoming common in Ohio, Indiana, and Illinois. Tenterden steeple is nowhere. It is not likely that any farmer thinking of tile-draining his land will be stopped by this wonderful theory, for he will be very apt to know that surface drains are more likely to produce floods than are buried tiles. He knows, too, that tiles carry little or no water in winter, when the soil is frozen, say at the date of our last flood, but that rain falling on a frozen soil will run off and make a flood. A flood produced by tiles in winter would be very little short of a miracle. Your correspondent must try again.

George Clendon, Jr.

Arizona, March 14, 1884.

Notes.

SUMNER, WHITNEY & Co., San Francisco, will add to their series of "Legal Recreations" a volume of verse by many lights of the profession, British and American, entitled 'Lyrics of the Law.'

Like every strikingly successful book, 'John Bull et Son Île' is soon followed by others of the same kind. Wyman & Son are about to publish in London a reply to it, called 'John Bull's Neighbor in Her True Light: Being some Criticisms by a Brutal Anglo-Saxon.' But M. Max O'Rell's lively sketch has hastened the publication of a book not less clever, and more serious and useful, namely, 'La Vie Publique en Angleterre,' by Philippe Daryl. M. Daryl has lived in England for ten years, making a special study of English institutions and customs; and his observations have been published in a series of letters to the Paris *Temps*, which form the present volume. We shall speak more particularly of it hereafter. A translation is to be published by Routledge.

Mr. Bancroft's "final revision" of his history has reached the fourth volume, embracing epoch third of the American Revolution, from May, 1774, to July, 1776, ending with the Declaration of Independence (D. Appleton & Co.). This volume, like the last, contains a well-marked and distinct period—that of organized resistance, ending in separation; and, as in the previous period, Mr. Bancroft's treatment is especially distinguished by the fulness with which the English discussion of the American question is reported. It appears to us that we notice more in this volume than in any of the others the exuberance of style and enthusiasm in the presentation of the American cause, which characterized the original edition. These qualities are considerably toned down in the earlier volumes, but in the stirring events of these two years the veteran historian seems to feel himself burn anew with the enthusiasm of his youth.

The advent of a white (or whitish) elephant has led the Messrs. Harper to bring out a new edition of Charles Reade's 'Jack of all Trades' (the story of the Siamese Djek and her keeper). The author should not complain because a rival house has done the same thing, omitting, however, the first four chapters.

The *Art Age* (New York: Arthur B. Turnure), a beautifully printed sheet, gives in its eighth number the particulars of the formation of the new Grolier Club, of this city, which consists of "bibliophiles, publishers, practical designers, printers, etchers, binders, lithographers"—in short, of men who, as mere book-lovers or as artists lovingly engaged in the manufacture of books, wish to promote a like sentiment in the community. Mr. Robert Hoe, jr., is President. The occasional publication of books is contemplated. A tentative Grolier Bibliography is begun in the same number of the *Art Age*. Of this periodical, by the way, we may say that it is already interesting and useful, and promises (with the Club, morally, behind it) to be more so.

Mr. S. S. Rider's gossipy *Book Notes* (Providence, R. I.) seldom fail to contain something curious or suggestive. Two columns in the issue for March 15 open a vein that would furnish much amusement in the working—"The Shows which our Grandfathers [why not our Fathers?] attended a half century ago"

A brochure, printed rather than published at Louisville, Ky., commemorates the late Joshua F. Speed, who played a very important, but unobtrusive, part in the war, in helping to retain Kentucky in the Union. He was the trusted friend of Lincoln, and his lecture upon that President, here preserved side by side with a rather commonplace lecture on a trip across the continent, was well worth printing or reprinting. Perhaps as characteristic an anecdote of Lincoln as any related by Mr. Speed, is that telling of his retort to a political opponent who had taunted him with his youth: "Live long, or die young, I would rather die now than, like the gentleman, change my politics, and, simultaneously with the change, receive an office worth $3,000 per year, and then have to erect a lightning-rod over my house to protect a guilty conscience from an offended God."

Mr. Christern sends us the catalogue of the French Water-Color Society, sixth exhibition, now open. Bearing the imprint of Jouaust, we naturally expect much from it, and it is indeed manufactured with more care and liberality than is common in such publications. The size of the pamphlet is a large octavo, and most of the pen sketches of the pictures commemorated are more elaborate and interesting in themselves than usual. A certain elegance, too, is attained in a very simple manner, by means of ornamental vignettes or borders indicative of the painter's line—his "leading motive," to borrow a term from music—as, *e. g.*, rifles and a row of helmets over Detaille's list of drawings.

With Part 118 Brehm's 'Thierleben' (B. Westermann & Co.) closes the chapters on insects, with many colored plates of beetles, butterflies, ephemeridæ, etc., auxiliary woodcuts in abundance (though we might have wished for color in depicting the protective mimicry of this order), and the usual index. No. 119 introduces the "lower animals (*Thiere*) of the German nomenclature—crabs, starfish, worms, etc.

The *Revue Historique* for March-April has a very attractive table of contents. Alfred Stern prints a number of important documents derived from the French Foreign Office, and pertaining to the relations of France and Prussia from 1807 to 1813. Not least remarkable are those which bear upon the Emperor Napoleon's pursuit of Stein in 1808 and 1809, and the vain endeavor of King Frederick William to have the blow of confiscation mitigated in favor of Stein's infant children. This paper will be continued. Joseph Reinach, the literary executor of Gambetta, contributes an orderly series of valuable inedited despatches and letters from this statesman during the siege of Paris, or from October 10, 1870, to January 22, 1871. That of November 9 is a pomt-for-point reply to complaints made against his dictatorship by the Provisional Government shut up in Paris. The final letter presages the end of the conflict at the capital, and declares the writer's resolve not to lay down his arms while a Prussian pollutes the soil of France.

Gambetta's wished-for "spirited foreign policy" is recalled by the formation of "L'Alliance Française," at Paris, which aims to strengthen the bonds between the mother country and its colonists wherever found. Its means are confined to the "propagation" of the language, through missionaries, schools, and associated study and cultivation. It will found institutions of learning, and train teachers, encourage books and reviews, especially of a pedagogic nature, award prizes, hold lectures, and publish a periodical bulletin. Algeria and Tunis will receive most attention, as being nearest. M. Tissot is president of this patriotic organization, and a large number of distinguished men in all ranks are among the honorary supporters. The Secretary is P. Foncin, 2 Rue St.-Simon.

No. 109 of the Berlin Geographical Society's *Zeitschrift* has an important map of the new Northern provinces of Greece, by H. Kiepert. It shows the administrative divisions, the population, etc., and is very full of names.

Nothing seems surer than that, like the Russians in Merv, the Austrians in Bosnia, and the French in Tunis, the English in Egypt have come to stay. A good chart of that country therefore becomes a necessity, and to meet the permanent demand Dietrich Reimer, Berlin, has published apart from Dr. H. Kiepert's 'Hand-Atlas' the general map of the Nile region ("Uebersichtskarte der Nilländer"), on a scale of about eighty miles to the inch, with a side-map of the Delta, on a scale of twenty-four miles to the inch. It has been revised to date, and ranges as far south as the middle limit of Shoa.

The *laudatores temporis acti* often refer to the giants of erudition of the sixteenth and seventeenth centuries. There are quite as erudite men now, though their works do not so often appear in folio, and there are men who, if not perhaps so erudite, give birth to a number of octavos sufficient to counterbalance a good many folios. One such man has just died in Rome, the Abbé G. Moroni, compiler of the 'Dizionario di eruditione storico-ecclesiastica,' in 103 double-columned volumes. Moroni was originally a barber by trade, and got into ecclesiastical circles by shaving Gregory XVI., one of whose principal councillors he became.

A new historical monthly has been started by the publishing house of Cotta at Stuttgart, under the somewhat cumbrous title, *Zeitschrift für allgemeine Geschichte, Cultur-, Litteratur-, und Kunstgeschichte.* It is to be devoted, in large part, to the history of civilization, ancient and modern, and to satisfy both the student and the unscholarly reader. No editor is named, and the rather inflated "Introductory," by "Die Redaktion," makes one inclined to expect more active management than learned supervision; but a long list of professors and authors who have promised their coöperation is presented, including such conspicuous names as Ernst Curtius, Felix Dahn, Droysen, Ebers, Giesebrecht, and Gregorovius. The external appearance of the periodical is very neat, but the monthly parts are slender, and the outcome of a year can be no more than two medium-size volumes. The contents of the first number embrace the first part of a topographical essay on "Ancient Syracuse," by A. Holm, Professor at the University of Naples; "A Picture of Convent Life in Austria," by A. Horawitz; a history of the murder of Anthony Ascham, the English Ambassador to the Court of Spain, in 1650 ("Ein Gesandtenmord im siebzehnten Jahrhundert"), by M. Brosch; "The Plague in Russia in 1654," part 1, by Professor A. Brückner, of the University of Dorpat, the historian of Peter the Great and Catherine II.; and an essay on "American Statesmen," by Professor Schönbach, of Gratz, forming a discursive review, in the friendliest spirit, of the biographical collection edited under that title by J. T. Morse, jr., in Boston. There are also a few brief book notices and an obituary.

Dr. Hermann Wagner, whom his dismissal from office, in 1873, in consequence of Doctor Lasker's revelations of Governmental corruption connected with the granting of concessions to railway companies, has not deprived of the title of "Wirklicher Geheimer Ober-Regierungs-Rath," has come before the public with a first instalment of political recollections, entitled 'Erlebtes: Meine Memoiren aus der Zeit von 1848 bis 1866 und von 1873 bis jetzt.' The first period to be embraced in these memoirs is that of the bloom of the ultra-reactionary party, known in Prussian history as the Kreuzzeitungpartei, or *Cross-Gazette* party, so called from the *Neue Preussische Zeitung*, its leading organ, and its emblematic frontispiece, the cross. Doctor Wagner founded the Berlin newspaper in 1848, after the outbreak of the revolutionary move-

ments of that year, and *in hoc signo* gallantly carried on the championship of conservative and privileged interests, as editor-in-chief till 1854, and subsequently as member of the Legislature. The period of the decline of the party, ending with his own disgrace, is left out. As a contribution to the recent history of Germany by a man so deeply versed in politics, and so learned as to be the editor of a 'Staats- und Gesellschafts-Lexikon' in twenty-three volumes, the book cannot fail to be interesting, in spite of the author's extreme partisan bias. It is, however, to form only one volume of moderate size. It is in part supplementary to the author's 'Die Politik Friedrich Wilhelm IV.,' and in an appendix it will contain the as yet inedited correspondence of that Prussian King with the Protestant Bishop of Jerusalem, Gobat.

Professor Hans Prutz, of Königsberg, the author of a life of the Emperor Frederick Barbarossa, of a work, 'Aus Phönizien,' descriptive of a scientific mission, undertaken in 1874, under the auspices of the German Imperial Chancellorship, for the discovery of the burial-place of that crusading Emperor, and of a number of monographs on events and institutions connected with the history of the crusades, has recently summed up the results of his investigations on the civilizing effects of the protracted struggles in the East between the Cross and the Crescent, in a work entitled 'Culturgeschichte der Kreuzzüge' (Berlin, 1883). It is written in a spirit friendly to the nations of the East, especially to the Arabs, to whose conflicts and relations with the Christians, in earlier times, much space is devoted in the introductory parts of the book. Professor Prutz is the son of Robert Prutz, the poet and historical and miscellaneous writer.

The Nautical Almanac Office of the Bureau of Navigation, Washington, has just added a third publication to its list of annual issues, entitled the *American Coaster's Nautical Almanac*. The first volume is prepared for the present year, and is mainly a compilation from the *American Ephemeris*, previously issued by the same office, and the publications of various Government Bureaus, particularly the Hydrographic Office, the Light-House Board, and the Coast and Geodetic Survey. The volume comprises 158 pages, more than half of which is taken up with lists of lights of the United States and foreign lights of the Atlantic coast. The astronomical data take up about forty pages, and the tide tables twenty. At the conclusion of the book a few pages are devoted to nautical directions for manœuvring in or avoiding the centre of cyclones in the North Atlantic; regulations for preventing collisions at sea; general information regarding the life-saving stations, and instructions enabling the mariner to coöperate with the stations in case of disaster; and a description and explanation of the cautionary signals displayed by the Signal Service, United States Army, on the approach of severe storms and rough weather. The entire work appears to be carefully and well planned and executed, and cannot fail to be a great boon to all officers in command of coasters in the West Atlantic.

The Observatory of the University of Cincinnati, which, previous to 1880, paid no attention to comets, the principal instrument being occupied almost entirely with double-star observations, has lately issued the seventh of its series of Publications, which is devoted entirely to observations of the comets of 1880, 1881, and 1882, made under the direction of Messrs. Ormond Stone and Herbert C. Wilson, and prepared for publication by the latter, now astronomer-in-charge of the Observatory *pro tempore*. Observations of position have been obtained of nine comets in all, two in 1880, four in 1881, and three in 1882—among the last, the great comet of that year. The physical observations of these comets consist of sketches, measures, and notes in regard to their appearance; and the appended photo-engravings are of about the same size as the original sketches. Ten plates accompany the work, which is issued in uniform style with the previous publications of this observatory.

The second or outer satellite of Mars (Deimos) was found to be visible with the great refractor of the Naval Observatory at the late opposition of the planet. It was also observed by the MM. Henry at the Paris Observatory, January 24, the satellite appearing as a star of about the fifteenth magnitude. As the planet was nearly as unfavorably located as possible, Mars being near aphelion, there is no longer any doubt of the visibility of this satellite, in some telescopes at least, at every opposition of the planet. The smaller telescopes can hardly be expected to reveal the satellites before the opposition of 1890.

A new astronomical journal has appeared in France, entitled *Bulletin Astronomique*. The first number was issued February 15, and the periodical will be published monthly. It is edited by M. F. Tisserand, assisted by MM. Bigourdan, O. Callandreau, and R. Radau, and is conducted under the auspices of the Paris Observatory.

—A correspondent writes us from New Brunswick:

"With regard to the word 'cull' discussed by the writer of the critique on Shakspere in last week's *Nation*, it may be interesting for you to know that the word is still used in Newfoundland in *sorting* or *separating* the different grades of salt codfish."

—We have just seen, in the *Bookmart* of January 20, a paragraph referring to our notice of the Cooke sale (*Nation*, Dec. 27), and asking us to "instruct large-hearted book collectors how they may divide their collections among public institutions with less expense and more mutual satisfaction." The task does not seem to us very difficult. Let the large-hearted collector who wants to do good to ten public libraries, and does not care for the renown to be derived from a large catalogue and a sale made conspicuous by inflated prices, order that his library be appraised by an expert, and that then the ten beneficiaries choose each $5,000 worth of books, all rival claims to be decided by an umpire designated by the donor. No appraiser charges 10 per cent., as auctioneers do, and there would be no expense of printing a catalogue for the part of the library chosen by the ten recipients. It seems to us that this method is much cheaper, and would be very much more satisfactory than the method adopted by Mr. Cooke. The *Bookmart* asks: "Is there any truer method of setting [settling?] values and the real rates [ratios?] between demand and supply than the auctioneer's hammer?" Perhaps not in an ordinary auction; but the prices obtained under such peculiar circumstances as prevailed in the Cooke sale are really no indication at all of the ratio between demand and supply. No book-buyer will ever accept the Cooke prices as a standard.

—Since our last issue, Harper & Bros. have printed by itself Charles Reade's story 'The Picture,' lately running in the *Magazine*. Some years ago Mr. Reade defended his "method" of plagiarism on the ground that he had done merely what other men of genius had done before him—"Je prends mon bien où je le trouve"—and that genius has the right of eminent domain over the material produced by mediocre writers, since literary metal is but dross until it receives the mint-stamp of authors like Mr. Reade. Though morally indefensible, it must be admitted that this procedure sometimes results in an advantage to literature. This may be seen by comparing 'The Picture,' which, as a correspondent has pointed out, is only a free translation of Mme. Reybaud's 'Mlle. de Malepeire,' with the original—a pretty enough little tale, but with no claim to the energy, vigor, and crispness of style which distinguish Reade's version. The reader, however, would be greatly in error should he jump to the conclusion that the variations, at least, are original with Mr. Reade, for herein is illustrated another phase of the latter's method. In the original, for instance, and in the two literal translations mentioned by our correspondents, viz.: 'Where Shall He Find Her?' (New York, 1867) and 'The Portrait in My Uncle's Dining-Room' (Boston, 1869), as well as in still another, 'The Old M'sieur's Secret' (New York: Carleton, 1882), the trial and sentence of the heroine are disposed of in a single short paragraph. In 'The Picture' is interpolated a vigorous and effective speech made to the jury by the heroine. Now, in August, 1867, was published in the *St. James Magazine* a tale called 'What the Papers Revealed,' a very free adaptation of the plot and incidents of 'Mlle. de Malepeire.' Comparison of the former with 'The Picture' shows that, as Mr. Reade has improved on the original in the body of his tale, so here he has improved on the adapter:

'What the Papers Revealed.'

"God forbid! gentlemen of the jury," he said, "that I should attempt to palliate this crime; but in shrinking from the act, I cannot forget the provocation. Trampled on and insulted by the man through whom she had lost all—name and fame, home and friends; reviled and disowned for him, deceived and degraded by him, this woman expiated in years of bitterness—who can estimate their bitterness?—the crime of having loved too faithfully. But even the veriest worm will turn at length. There came a day when the one drop that filled it to overflowing was poured into this woman's cup. Encouraged by the applauding jeers of every member of his family, the brutal coward struck her as she stood alone among them, in her fatal defenceless superiority. Was it the blood of a thousand ancestors that rushed with tumultuous rebellion to her brain? Was it the last agonized throe of a yet unbroken spirit? I dare not conjecture. I only know that, goaded to madness, in a frenzy of wild unconsciousness, the unhappy woman rushed to avenge her wrongs—to cancel her misery in the crime for which she now stands charged before you."

'The Picture.'

"Citizens, the public accuser has told you I killed my husband, and that, alas! is too true; but he has told you I killed him maliciously, and there he is quite mistaken. My husband was my all. I gave up father, friends, rank, wealth, everything for him, and I loved him dearly. He gave me a bitter provocation, and I reproached him cruelly. Then he struck me barbarously. . . . My passion was great, I admit, but my fear was greater; and in fear I struck, not malice. . . ."

—A curious dispute has arisen out of the production of Mr. Brander Matthews's comedy of "Margery's Lovers" at the Court Theatre in London. Mr. Henry Pottinger Stephens, the editor of a new and not particularly attractive theatrical newspaper called the *Topical Times*, claims that the piece is a gross plagiarism of a play called "Hearts," written a few years ago by himself and Mr. Percy Mitford, but which has never been produced, and of which only one copy—the author's—is known to exist. How, then, could it be plagiarized? The play was read, it seems, in America by Mr. Daly and Mr. Wallack, and in England by Mr. Wilson Barrett, but by no one else. It was, however, at the Court Theatre for at least two months, and was even cast there, according to Mr. Stephens. How this could possibly account for the plagiarism of it by Mr. Brander Matthews is not at all clear, since Mr. John Clayton, the manager of the Court Theatre, asserts that Mr. Matthews was a perfect stranger to him when he submitted "Margery's Lovers," and that he was informed by Mr. Matthews that "it had bee

written for a long time, and shown to Mr. Wallack." Thus Mr. Wallack seems to be the only person who can throw light on this mysterious matter. "The question is not," wrote Mr. Stephens to Mr. Clayton, "whether your play be a good one or ours a bad one, or *vice versa*—our play cannot now be produced. The fact remains that a literary theft has been committed, and I mean, if possible, to sift the matter thoroughly." This anticipates the reply that since "Margery's Lovers" has not proved a success it is not worth while to quarrel about it. But the correspondence on the subject has already degenerated into an unpleasant personal quarrel, begun by Mr. Stephens's unmannerly remark that he presumed Mr. Clayton was "aware that in cases of theft the receiver is equally liable with the thief." To which Mr. Clayton indignantly retorts that he is "neither receiver nor thief," and curtly denies several of Mr. Stephens's statements. Mr. John Hollingshead accepted the position of arbitrator, but has been compelled to decline it through illness, and another has not yet been agreed upon. Thus far the whole thing looks like an attempted sensational advertisement for the *Topical Times*, with a suspicion of personal ill-will at the bottom of it; and Mr. Matthews, who has emphatically denied the charge in a cable message to the *Daily News*, is to be congratulated upon his distance from the scene.

— In the *Popular Science Monthly*, for April, Mr. Herbert Spencer lifts the veil from the future and protests against "The Coming Slavery," *i. e.*, the enslavement of the individual to the socialist or communist machine. The object of socialism is to substitute for the theory of the state as existing for the happiness and welfare of its members, the idea that the individual exists for the benefit of the community; and as a socialistic order, like any other, must be based on force, each member, as an individual, will, when socialism is once established, be a slave to the community as a whole:

"Such a relation has habitually existed in militant communities, even under *quasi*-popular forms of government. In ancient Greece the accepted principle was that the citizen belonged neither to himself nor to his family, but belonged to his city—the city being with the Greek equivalent to the community. And this doctrine, proper to a state of constant warfare, is a doctrine which socialism unawares reintroduces into a state intended to be purely industrial. The services of each will belong to the aggregate of all, and for these services such returns will be given as the authorities think proper. So that, even if the administration is of the beneficent kind intended to be secured, slavery, however mild, must be the outcome of the arrangement."

But this is only the first step. There are more behind:

"The love of power, the selfishness, the injustice, the untruthfulness, which often in comparatively short times bring private organizations to disaster, will inevitably, where their effects accumulate from generation to generation, work evils far greater and less remediable; since, vast and complex and possessed of all the resources, the administrative organization once developed and consolidated must become irresistible. And, if there needs proof that the periodic exercise of electoral power would fail to prevent this, it suffices to instance the French Government, which, purely popular in origin, and subject from time to time to popular judgment, nevertheless tramples on the freedom of citizens to an extent which the English delegates to the late Trades-Union Congress say 'is a disgrace to, and an anomaly in, a republican nation.' The final result would be a revival of despotism. A disciplined army of civil officials, like an army of military officials, gives supreme power to its head—a power which has often led to usurpation, as in mediæval Europe and still more in Japan—nay, has thus so led among our neighbors within our own times."

Finally, when we have reached this point, the sociological pendulum begins to swing back:

"It would need but a war with an adjacent society, or some internal discontent demanding forcible suppression, to at once transform a socialistic administration into a grinding tyranny like that of ancient Peru; under which the mass of the people, controlled by grades of officials, and leading lives that were inspected out-of-doors and in-doors, labored for the support of the organization which regulated them, and were left with but a bare subsistence for themselves. And then would be completely revived, under a different form, that régime of status—that system of compulsory coöperation—the decaying tradition of which is represented by the old Toryism, and toward which the new Toryism is carrying us back."

—This is a new form of the very old jeremiad that all power tends to concentration; concentration in one hand leads to tyranny, tyranny to rebellion for the sake of liberty, liberty to license, license to a new intrusion of tyranny. This is in a certain sense a law of human nature; but it does not enable us to know accurately what is likely to be the immediate fate of any nation or people. Mr. Herbert Spencer's jeremiad, however, is applied distinctly to England, and it is a gloomy prospect that he declares to be before her. It is a jeremiad which ought to be still better adapted to the American market, because here there are no "Tories" to stem the tide. The race on both sides of the Atlantic is in a bad way; but why remind us of it? What can we do? The English might avert their fate for a time by getting into foreign wars; but we cannot afford anything of that sort, for we have no navy and hardly any army. With Agnostics and the Nineteenth Century Club doing their best to take away our hopes of immortal life, and Mr. Spencer demonstrating that there is no hope on this side of the grave, and that we must all look forward to being enslaved by Justus Schwab and the trade unions, the old maxim never to despair of the Republic seems an insult to our intellect. How can we do anything but despair, especially when we find, on turning to a good old conservative magazine like the *North American*, one of the writers discussing in the current number the proper precautions to be taken for the preservation of our civilization from a return of the Glacial period? The air seems to be full of danger on every side.

—The *Century* has an illustrated article on the White House, by Mr. E. V. Smalley, which contains some account of the new decorations of the interior, and calls attention to the absurdity and inconvenience of having the President's residence serve the purpose of a public office as well. There certainly seems no reason why one of the few handsome residences bequeathed to us by the last century should be made uncomfortable and at times almost uninhabitable for the head of the Government whom we put in it. There is no necessary inconsistency between a republican form of government and the protection of the private life of its head from the impertinent intrusion of strangers who want to button-hole him. If the right to button-hole the President is an inalienable right, then certainly a place for its exercise should be provided by Congress, at the public expense. The right of access to the Executive as now enjoyed is destructive of the cleanliness of the house which the country gives him; the hosts of politicians muddying and otherwise soiling the carpets and furniture, so as to give the White House from time to time a shabby and demoralized appearance, and to entail many otherwise needless appropriations from Congress. The old "levee" system is gradually disappearing, the public receptions being now few and far between, and the audience abuse will unquestionably follow it. Progress of late years has been slower than it otherwise would have been, because the manners and customs of the White House have been so generally in the hands of people who cared very little about privacy. Indeed, since Buchanan's time, the etiquette of the place has been furnished, if at all, like the dinners, by contract. The audience abuse really involves higher considerations than those of etiquette, viz., decency and comfort. Good Emperors and Sultans grant audiences to their people, but this is supposed to be because the government is one of men, not laws, and because Emperors and Sultans hold courts of justice of the last resort, and cannot shut out the public without doing injustice. But for justice we go to the courts, and for laws we go to Congress, and the only thing left to go to the President for is offices. If the truth were known, the persons who insist upon the right of every American to have an interview with the Executive are almost altogether office-seekers, and Congressmen who are their friends and backers; and as long as the right is insisted upon, the least the Congressmen who make so much use of it can do is to provide a proper place for its exercise. The *Century* also contains an interesting account by George Alfred Townsend of the adventures of Wilkes Booth in getting across the Potomac after the assassination of Lincoln. Everything in it tends to confirm the impression produced at the time by Booth's behavior—that a passionate love of notoriety was the chief motive of his act. The first question he asked when he got to a temporary place of safety was as to the "view" the newspapers took of him.

—Examination shows the 'Statesman's Year Book' for 1884 (Macmillan) to be more than usually replete with useful information. Separate notices are for the first time given to Madagascar, the Orange Free State, the Transvaal, Zanzibar, Burma, and Hawaii, while the space devoted to each of a number of other countries has been considerably increased. Ballot boxes and electoral suffrages play nowadays a large part in controlling the course of events, and a book for statesmen ought to give all the facts attainable as to the theoretical and practical workings of the electoral systems of the various civilized Powers. The statistics furnished by the present 'Year Book' as to the number of people who may vote if they want to, and who actually did vote at the last general election, are not the least valuable and interesting of its features. We lack space to comment upon the facts which these figures reveal. In no other country in the world do so many people go to the polls as in the United States at a Presidential election; and, what is practically more important, nowhere, with perhaps the single exception of Belgium, with its very limited suffrage, do so small a proportion of those who may vote neglect to do so. By the census of 1880, there were in the United States 12,571,437 males over twenty-one. Making a proper allowance for unnaturalized foreigners and other disqualified persons, the number of men who had a right to vote was probably rather under than over 12,000,000; and of these, 9,216,856, or something more than 76 per cent, actually cast their ballots. The ratio of votes cast to qualified voters would be even greater if the former slave States were not taken into account. It is impossible in a work of this sort to exclude errors altogether, but it is a satisfaction to note that the absurd blunders and misstatements as to this country which formerly disfigured the 'Year Book' no longer appear. It is not hard to understand how the editor falls into the mistake of giving, on page 632, for the number of States in the Union at the date of each decennial count, the number of the present States of which the population was then separately returned in the Census reports. A more serious error is made on

page 633, when it is stated that there were in the United States in 1880, 13,011,646 *natives* of foreign-born parentage. There were so many *residents* of foreign parentage, but among them were included all but 33,252 of the 6,679,943 foreign-born inhabitants. The table of receipts and expenditures on page 624 is stated to exclude sums received and paid out on account of premiums on purchases and sales of certificates of the public debt. A comparison of the table with the detailed reports of the Secretary of the Treasury will show that premiums are comprised both in the receipts and expenditures as they are given in the 'Year Book.' On page 637, the table purporting to give the value of the exports of merchandise from the United States in each of the last ten years, contains for 1882, 1881, 1880, 1877 and 1876 figures representing the value of the exports of domestic merchandise only, while for 1883, 1879, 1878, and 1874 the values given include the total exports of merchandise both domestic and foreign. The value of the exports of merchandise in 1875 is said to have been $545,069,027; the report of the Bureau of Statistics puts it at $513,442,711. The table of exports of specie, on page 638, gives the value of the total exports for each year except for 1877, when it gives that of the domestic specie only.

—Some curious results are occasioned by the addition of one figure too many, or the omission of a figure that ought to be in. Thus the estimated expenditure for the Austro Hungarian Empire and for Austria proper in 1883 (p. 14), the French exports of home products in 1882 (p. 87), and the number of emigrants from Mecklenburg-Schwerin in 1882 (p. 155) are each multiplied by ten. It is probable that in the perpetration of a couple of similar blunders will be found the explanation of the manifest inconsistencies in the statement on page 551 of the statistics of Canadian shipping. If the total tonnage of the Dominion in 1881 was only 1,260,777 tons, it could not well have "comprised 973 steamers, measuring 1,990,902 tons." Nor does it seem probable that in 1882, 760,113 tons would have been built at the small cost of £541,017. On the other hand, the omission of the figure 1 on page 281 makes it appear that the capital invested in English railroads in 1882 was only one-tenth as large as it actually was; the leaving out of a 1 on page 256 cuts down the percentage of increase in the population of Scotland between 1871 and 1881 from 11.18 per cent. to 1.18 per cent.; and if a 9 were printed before the 42,215 on page 426, the number of electors in Spain would not appear to be but 5 per cent. of those that really existed. The area of Keewatin as originally laid out was nearly a hundred times 450 square miles, and for that number, as given on page 547, we should probably read 450,000. The size of the French battalions in Tunis must be unusually large if a battalion of infantry, a squadron of cavalry, and a part of a battalion of artillery will together number 15,000 men (p. 715). If the new ironclads which have been built in Germany for the Chinese Government have armor "14½ metres thick" (p. 730), it is not surprising that they were "detained" in Germany.

— The late Dr. Lasker was an occasional contributor to the columns of the *Rundschau*, and a personal friend of the editor, Mr. Rodenberg, who devotes to him an article in the March number, containing a series of private letters, with reminiscences of an intercourse lasting more than twenty years. Although politics was Lasker's specialty, he always managed to find time to keep up with the literary and artistic movement of the time, both in 1873, when his popularity was so great that he was commonly mentioned in one breath with Bismarck and Moltke, and a few years later, when the tide turned against the party which he led. Literary projects occupied much of his time, and the direction which his thoughts took may be inferred from the remark that he was very fond of Dickens's works, in which he especially admired the humanitarian tendencies and the reforms effected through them. Professor Edward Zeller contributes an article on the "Significance of language and its teaching for spiritual life," which in true German fashion begins with Noah's Ark, Pythagoras, and Cleanthes. Zeller insists that language is not innate, not a necessary result of the structure of our vocal organs, but the work of man, the accumulated result of the labors of countless generations. From music, language is distinguished by being the outcome of the need of communicating with others, while music, like laughing, crying, jumping, and dancing, is simply the spontaneous expression of emotions, without any original intention of conveying them to others; a vocalist needs no listener but himself. The assertion that conscious thinking can only be done with the aid of words does not tally with the dictum of a great German philosopher that "all original thinking is done in images." The advantages and disadvantages of having two mother tongues, as it were, are also considered. Under the first head, Zeller mentions a special ease in adapting one's self to new circumstances; under the second, an intolerable commingling of languages, as in America, or a habit, prevalent in Switzerland, Alsace, and Belgium, of using the mother tongue only as dialect, and the foreign as the language of the educated, whereby the masses become estranged from the literature of their country without assimilating all the peculiarities of the foreign language. Herman Grimm writes on Cornelius, apropos of the hundredth anniversary of his birth, and Professor Nöldeke, of Strassburg, on "Theodorus, King of Abyssinia." Karl Hillebrand's article on the old and the new novel, in the current *Contemporary*, appears here in a German version. The editor explains that the absence of Hillebrand from the pages of the *Rundschau* for almost two years and a half has been due to a serious illness.

—By the death of Ezra Abbot, which occurred March 21, at Cambridge, Mass., the science of New Testament criticism has lost one of the foremost scholars of this generation. There is hardly a branch of this department which his studies have not illustrated, and the accuracy and impartiality of his work have given him an authority that it has been the lot of few men to enjoy. He has left a noble example to all students in his habit of patient research, his microscopic knowledge, his candor in weighing arguments, and his power of sober judgment. He was born in 1819 in Jackson, Maine, and, after passing through Phillips Exeter Academy, was graduated in 1840 at Bowdoin College. After teaching several years in Maine, he went to Cambridge in 1847, taught in the Cambridge High School in 1852, was appointed Assistant Librarian in the Harvard College Library in 1856, and Bussey Professor of New Testament Criticism and Interpretation in the Harvard Divinity School in 1872, which last position he held till his death. In the library he had charge of the cataloguing department, with good opportunity for bibliographical work, of which he was all his life very fond. In his hands bibliography was no dull list of title-pages, but a delightful collection of wonderful facts and histories, and he was the resort of his friends and of many others for information concerning books of all kinds. His first publication was a catalogue of the Cambridge High School Library, and in 1869 appeared his 'Literature of the Doctrine of a Future Life.' His most valuable bibliographical work is contained in the American edition of 'Smith's Dictionary of the Bible,' the utility of which to critical students, it may be said, has been doubled by his references to the later, especially German, authorities. His proper field, however, was New Testament exegesis and criticism, and particularly the latter in its two branches, textual and historical criticism. A fair example of the minuteness and breadth of his exegetical study is to be found in his article on Rom. ix. 5, printed in the Journal of the Society of Biblical Literature and Exegesis—a paper on which he spent as much time and labor, from his determination to go to the bottom of every point, as would have sufficed some men to write a book. On New Testament textual criticisms he has published less than on any other subject, and yet it is to this, perhaps, that he devoted the largest part of his time. This is greatly to be regretted, for he had hardly an equal in acquaintance with the manuscripts, versions, and patristic quotations on which the New Testament text depends. Much of his work in this department was in the form of contributions to other men's books: to Dr. F. H. A. Scrivener, for example, he sent a long list of errors occurring in his 'Plain Introduction to the Criticism of the New Testament.' He had opportunity, also, as member of the American Committee of Revision of the New Testament, to make a worthy use of his text-critical learning; but, beyond such results as may exist in the revised New Testament text, and a few scattered newspaper articles, he has left no record of his researches. Among other things he was working on a critical review of Westcott and Hort's second volume, which gives their principles of New Testament textual criticism, and this, if he had finished it, would have been an important contribution to the subject; but he has left nothing in shape for publication. For several years before his death he was occupied with work on the Prolegomena to Tischendorf's eighth edition of the Greek New Testament, the preparation of which is in the hands of an American scholar, Dr. Caspar René Gregory, of Leipzig. The first volume of the Prolegomena, which is now completed, contains Dr. Abbot's textual and grammatical contributions, prepared with his accustomed minute accuracy and careful discrimination, the value of which scholars will soon be able to test. His only historical-critical work is 'The Authorship of the Fourth Gospel' (1880), an examination of the external evidence in the case, the scholarly precision and close reasoning of which called forth high commendation from prominent European writers on this Gospel, one of whom declared that the facts had never before been so well stated. Dr. Abbot intended following this up by an examination of the internal evidences, for which he had collected a large mass of material; but this design, like many others of his, was never executed. It may be mentioned that he ascribed the Gospel to the Apostle John. He was for many years Recording Secretary of the American Oriental Society. This detail of his principal printed works only poorly describes his unceasing scholarly activity, and only his pupils and friends know the inspiration given by the high character of his scholarship, and by the purity, faithfulness, and self-sacrificing devotion of his daily life.

—There is no chapter in Roman history more interesting or more instructive than that which describes the successive steps and the well-considered line of policy by which the city built up her empire within the peninsula of Italy. Many of these steps are obscure, and at best the clas-

sification of the Italian communities—the different groups of *municipia*, *coloniæ*, and *civitates fœderatæ*—is not easy to understand in detail; while as the Social War put a sudden end to the process of growth, our information is late and fragmentary. We find this subject treated with great fulness and perspicuity by Julius Beloch, in 'Der italische Bund unter Roms Hegemonie' (Leipzig, 1880). By "Italian Confederacy" he would not be understood to imply a regularly organized confederation: there was none, only "an aggregate of more than a hundred different alliances, which have nothing to do with one another further than that in every case Rome is one of the contracting parties" (p. 194). The book therefore contains an analysis and history of the various classes of towns and confederacies of Italy down to the Social War. The author begins with an attempt, based upon Pliny, to draw up a schedule of the several *Gemeinden* (*civitates*) of Italy; these are 443 in number, arranged according to the eleven Regions. Then follows a chapter upon the local tribes, their history, and the distribution among them of the Italian communities. Chapters upon the Ager Romanus and the population of Italy are followed by three very instructive chapters, in which the whole subject of colonies, *municipia*, and lesser communities is exhaustively treated; and three others upon the Italian Allies, the Latin Confederacy, and the legal relations of the allies to Rome—*das italische Bundesrecht*. For readers of Mommsen who would like to follow his general sketch more into details, this book will be very acceptable. The author agrees with Mommsen in general, differing from him, however, in a few points, particularly as to the *Jus duodecim coloniarum*, which he considers to be that of the twelve colonies that refused to furnish their contingents in the war against Hannibal; and as to the famous treaty with Carthage, which he holds—as Mommsen did in his early editions—to belong to the first year of the republic. Another point of interest is that Mr. Beloch maintains, and appears to prove, that the Latin Confederacy, at the time of the treaty with Spurius Cassius, B. C. 493, contained only ten or eleven independent members. There is a good geographical index, and two very instructive maps—one of Italy before the Social War, the other of the Ager Romanus at the beginning of the Second Punic War. Both are distinctly colored.

LEONARDO DA VINCI.—I.

The Literary Works of Leonardo da Vinci. Compiled and Edited from the Original Manuscripts by Jean Paul Richter, Ph.Dr., &c. 2 vols. London: Sampson Low, Marston & Co.

THE fascination which the genius of Da Vinci has exerted from his own times down is both manifested and justified by these elaborate and admirable volumes. They contain selections from his note-books, with copious and excellent heliograph reproductions (by Dujardin) of the MS. and the illustrations which are scattered through the notes, together with some of the more elaborate chalk drawings, and pages of sketches embodying his ideas, studies, and inventions. In the archæology of art there has been probably no more important undertaking than this of Dr. Richter, whether we consider Leonardo's relations to art and his claim to the title of *sommo artista*, or his curiously complex genius—painter, sculptor, architect, engineer, anatomist, physiologist, moralist. Subtle in his art, ingenious in mechanics, original and persistent in his pursuit of science, and profound and sincere in his morality, he has left his sign manual in almost all branches of human activity. He competed with Michael Angelo in painting; his Sforza monument was a challenge to the sculptor of the Moses and David; he studied the mystery of gravitation before Newton, and of the circulation of the blood before Harvey. His treatise on painting has been a mine of essays and instruction-books since his death, and his incomplete architectural designs have infiltrated through the architecture of the subsequent ages.

And yet of all his works only a few pictures remain in a condition to convince us that his art was a success, and point to the possibility of his accomplishment of all he planned in other directions. His greater works have all remained in the limbo of projects or perished. The "Last Supper," by which he is best known, is a wreck only preserved to us through copies; his great Sforza monument was never finished; and his "Battle of Anghiari" has so utterly perished that we can only conjecture what it was. His plans for mausoleum, fortress, and cities; his designs for cathedrals and canals; his inventions for war, for commerce, for agriculture, are only in the state of projects. Even his book on the art of painting remains in the form of detached notes, suggestions, hints of laws, and indications of composition, whose greatest interest is, for the most part, as evidence of his colossal intellect, since it has little practical use for those for whom he intended it—the students of art.

"Vasari says, and rightly," we are told in Dr. Richter's preface, "in his life of Leonardo, 'that he labored much more by his word than in fact or by deed'; and the biographer evidently had in mind the numerous works in manuscript which have been preserved to this day." But the fact which our collator seems to have found inexplicable—that these works have remained "so long unpublished, and indeed forgotten"—is, we conjecture, due rather to their fragmentary state and insufficiency for any practical utility, than to the difficulties of deciphering them, great as these now are, though probably not so great when they were most called in question. This very difficulty of deciphering is due in part to the fragmentary and disconnected character of the MSS. The editor's account of them will make this clear:

"Leonardo's literary labors in various departments both of art and of science were those essentially of an inquirer; hence the analytical method is that which he employs in arguing out his investigations and dissertations. The vast structure of his scientific theories is consequently built up of numerous separate researches, and it is much to be lamented that he should never have collated and arranged them. His love for detailed research—as it seems to me—was the reason that in almost all his manuscripts the different paragraphs appear to us to be in utter confusion; on one and the same page observations on the most dissimilar subjects follow each other without any connection. A page, for instance, will begin with some principles of astronomy or the motion of the earth; then come the laws of sound, and finally some precepts as to color. Another page will begin with his investigations on the structure of the intestines, and end with philosophical remarks as to the relations of poetry to painting, and so forth. Leonardo himself lamented this confusion, and for that reason I do not think that the publication of the texts in the order in which they occur in the originals would at all fulfil his intentions. No reader could find his way through such a labyrinth; Leonardo himself could not have done it.

"Added to this, more than half of the five thousand manuscript pages which now remain to us *are written on loose leaves, and at present arranged in a manner which has no justification beyond the fancy of the collector who first brought them together to make volumes of more or less extent.* Nay, even in the volumes, the pages of which were numbered by Leonardo himself, *their order, so far as the connection of the texts was concerned, was obviously a matter of indifference to him.*"

They are, in fact, not books at all, but, as one may, by running over the pages of Dr. Richter's volumes, convince himself at once, suggestions of material for books; jottings down of ideas which would come in somewhere in one, if it were ever written; a commonplace book in which were recorded all the fragmentary ideas that floated through Da Vinci's brain; memoranda which he noted down for his own future use and study, and problems which he put to himself and of which he has suggested no solution. He writes to himself: "Have your books on anatomy bound."

The 'Book of Painting' will therefore be consulted in vain by young painters for any definite course of instruction in painting. They will find many apothegms and sentences which illuminate with the intelligence of a singular genius the path to follow, but the work was never reduced to system by the author, and is only reproduced by Dr. Richter *tale quale*. Thus he says: "Those who are in love with practice without knowledge are like the sailor who gets into a ship without rudder or compass, and who can never be certain whither he is going. Practice must always be founded on sound theory, of which perspective is the guide and gate; and without this, nothing is well done in regard to painting." And again: "The painter who draws by practice and judgment of his vision, without reasoning, is like a mirror, which by itself imitates all things placed in front of it, without knowledge of them." But the practical value of these isolated hints, even to a student of painting, is not great, and this not merely from their want of completion and connection, but from the inherent character of Da Vinci's mind, which was scientific and not artistic. This seems hazardous to say of a man who achieved so much in art as Leonardo, but the fact remains. He was a scientific man *par excellence*, and the subtlety of his speculations and analysis excludes any possibility of a co-existent and commensurate synthesis. He was a geometrician, a naturalist, forced by his surroundings and a certain vein of virtuosity in his character to give great attention to art; but he never was undivided in this devotion, as he must have been to have achieved his full measure of excellence. He always insists on judging and working by rule; and his work, excellent as it is, is invariably more distinguished by mechanical tendencies and achievement than by emotional or imaginative—by a cold, reasoned construction, rather than by any spontaneous and sympathetic quality. What severe and correct drawing and largely realistic study of his material could do, he did; but we are inclined to think that for his fame beyond this he is debtor rather to the general reputation of his astonishing all-roundness, and the attainment of high excellence in many branches of work, than to actual achievement in one. The intellectual greatness of the man imposes on us silence as to any shortcomings in his art. He overcame his time by his commanding completeness, and by this victory we are still controlled; but we are far enough now from his epoch and his ideals to admit, with Vasari, that he labored more by his word than his works. This is an excellent thing for a teacher, but a dubious tribute to a painter.

In his scientific relation, again, he must be judged by the science of his day, and notable are the points in which he was in advance of all his contemporaries, though he is in many others quite as dark as they. His controverting of the theory of vision which makes the eye send out a seeing virtue (*mandino fuora la virtù visiva*), will serve as an example:

"It is impossible that the eye should project from itself, by visual rays, the visual virtue, since in opening it that front portion which should be the first in going out, and would have

to go to the object, could not do it without time. Being so, it could not go to the sun in a month's time. . . . This being the case, if the eye consisted of a million worlds it would not prevent its being consumed in the projection of its virtue."

The notes on the colors of the rainbow are another instance of this close reasoning, which, though not reaching the truth, is discriminating as to the then entertained errors. In the botany of his 'Book of Painting' he shows himself a true naturalist, and his observations on the growth of plants, ramification, the facts of sunlight and shade, show the closest study of arboreal structure and details. As an observer of external nature he broke new ground. "The deeper colors of shadows of mountains at great distances take a more beautiful and more uniform color than do their luminous portions, and from hence it arises that when the rock of a mountain is reddish its lighted portions are purplish, and the more it is lighted the more it appears of its proper color"—is an observation which any landscape painter of to-day may have made, but which, in the purely conventional state of landscape painting in Leonardo's day, was a revelation of naturalism. "Painters deceive themselves oftentimes by representing water in which they make visible (reflected) that which the man sees. But the water sees the object on one side and the man on the other"—contains a fact which many landscape painters ignore to-day.

In regard to Da Vinci's anatomical studies, it is to be said that for him, with his strong scientific tendencies, painting was probably more a handmaid to his science than the converse. It was impossible for him to rest at the surface of things, and *that* the truest artistic vision will always do, because to think of what is beyond the visible disturbs the calm perception of what is seen. There is no reason to suppose that the Greek sculptors knew anything of internal anatomy, but, on the contrary, the best ground for concluding that they had no conception of it; and yet they saw with a delicate discrimination of external muscular action which no man of the anatomical schools has ever shown. Reasoning from the relation of the analytic and synthetic faculties, this would seem to be the inevitable conclusion; and the history of modern art does not show that a true artist was ever helped by the study of internal anatomy, but that many have been made pedantic and artificial by it. Even Michael Angelo did not escape this effect.

The whole collection of sayings, maxims, axioms, and directions in the 'Book of Painting' is of the mechanical and prescriptive kind, of no present real value to painters of originality or who have access to good teaching; but they are interesting as showing the bent of this master mind, whose level of multiform greatness rises higher than any other that we know of so well. The voluminous notes and memoranda of composition and groups in the "Last Supper" and the "Battle of Anghiari" constitute, from the archæological point of view, the most valuable part of the book, and it is from this point that Leonardo is the most interesting object of study which the biography of art has preserved for us. Richter's studies and elucidation of the confused memoranda for these two pictures are among the best examples we possess of successful research in this direction. Of the difficulties encountered in the work only the reader of the book can form an adequate opinion. There is a most interesting variation from the design carried out in the fresco of the "Last Supper" contained in the sketch in red chalk reproduced here, in which St. John, who sits at Christ's left hand, throws himself forward on the table, his face buried in his hands as if in an agony of emotion as Christ is speaking, evidently foretelling his betrayal and death. The important chalk drawings relating to the picture are reproduced with an excellence which we have already commended.

THE OLD TESTAMENT IN THE NEW.

Quotations in the New Testament. By Crawford Howell Toy, Professor in Harvard University. Charles Scribner's Sons. 1884.

FEW readers of the New Testament ever try to compare its acknowledged quotations from the Old, and still less the sentences and phrases which it tacitly borrows, with the corresponding words of the prophets, psalmists, or other sacred Hebrew writers. Few even of those whose attention is from time to time called, by the notes of an expositor, to discrepancies in words and sentences of the Old and New Testaments which ought to be identical, have an idea how frequent such discrepancies are, and how essential are some of them. The divergence lies often in mere particles or turns, sometimes in the phraseology, and sometimes in the different sense and meaning attached to the phrases. Let us examine a few instances, as they almost consecutively present themselves:

In Acts iii. 22, 23, we read: "Moses truly said unto the father, A prophet shall the Lord your God raise up unto you . . . And . . . every soul which will not hear that prophet shall be destroyed from among the people." The corresponding words in Deuteronomy (xviii. 15, 19), are: "The Lord thy God will raise up unto thee a prophet . . . And . . . whosoever will not hearken . . . I will require it of him." The Septuagint version accords with the Hebrew text. A part of the discrepancy is explainable by some copyist having changed the Hebrew word *mē'immō*, of him, into *mē'ammō*, from his people. According to Acts iii. 25, God said "unto Abraham, And in thy seed shall all the kindreds of the earth be blessed." "The kindreds" stands for "the nations" of Gen. xxii., 18—Hebrew text and Septuagint—but corresponds to Gen. xii. 3, which has, however, "in thee," instead of "in thy seed." Acts vii. 43, quotes Amos (v. 26, 27): "Ye took up the tabernacle of Moloch, and the star of your god Remphan, figures which ye made to worship them: and I will carry you away beyond Babylon." This agrees in part with the words of the prophet as rendered in the Septuagint, which couples with the tabernacle of Moloch the star of the "god Raiphan"; but the Hebrew text of Amos, as literally translated in the Authorized Version, says: "Ye have borne the tabernacle of your Moloch and Chiun your images, the star of your god, which ye made to yourselves. Therefore will I cause you to go into captivity beyond Damascus." And the Septuagint, too, has "Damascus," instead of the New Testament's "Babylon," which is strangely anachronistic. The New Testament's "Remphan" is generally explained as being a corruption of the Septuagint's "Raiphan," which must have been originally *Kaiphan*, representing the Hebrew *Chiun*, properly *Chevan*, the primitive name of the planet Saturn. Acts viii. 33, quotes from Isaiah (liii. 8) this "place of the Scripture": "In his humiliation his judgment was taken away," literally as the Septuagint has it; but the Hebrew text of the prophet is different, and the Authorized Version renders it, "He was taken from prison and from judgment." Acts xv. 15–17, quoting Amos (ix. 11, 12), in the words of the Septuagint, says: "It is written, After this I will . . . build again the tabernacle of David, . . . that the residue of men might seek after the Lord"; but in the Hebrew original it is written: "I will raise up the tabernacle of David, . . . that they may possess the remnant of Edom." Evidently the Hebrew copy of Amos from which the Septuagint was translated had *yidr'shū*, may seek, instead of *yīr'shū*, may possess; an abbreviation of the name of "the Lord," instead of the untranslatable particle *eth* of the Masoretic text; and *ādām*, man, instead of *ĕdōm*, Idumæa. That the Septuagint's text was wrong is obvious to every critical examiner.

Striking examples of new meanings attached to Old Testament phrases occur at the very opening of the New. Isaiah having gone to meet Ahaz, King of Judah, to allay his fears in regard to the alliance formed against him by Rezin, King of Syria, and Pekah, King of Israel, gave him a sign of his own divine mission in this prediction: "Behold, a virgin [according to the Septuagint, which is followed by the Authorized Version; "the young woman," *hā'almāh*, in the Hebrew text] shall conceive and bear a son, and shall call his name Immanuel. Butter and honey shall he eat, that he may know to refuse the evil, and choose the good. For before the child shall know to refuse the evil, the land thou abhorrest shall be forsaken of both her kings" (Is. vii. 14-16). Unmindful of the connection between the infancy of the child of the sign and the abhorred invasion of the two kings, the evangelist Matthew (i. 20-23) sees in the child of the *'almāh* indicated to Ahaz the son of Mary, who was conceived of the Holy Ghost and called Jesus—a name denoting salvation, and thus corresponding to Immanuel, or God-with-us—"that it might be fulfilled which was spoken of the Lord by the prophet, Behold, the virgin shall be with child, and bring forth a son, and they shall call his name Immanuel." The same evangelist (ii. 15), quoting part of a sentence in Hosea (xi. 1), which speaks of Israel in Egypt, and of the divine deliverance accorded the young nation, in these tender words, "When Israel was a child, then I loved him, and called my son out of Egypt," presents the quotation as a prophecy referring to Jesus, who as a child was taken by his parents to Egypt, "that it might be fulfilled which was spoken of the Lord by the prophet, saying, Out of Egypt have I called my son."

These few examples may, perhaps, suffice to show what grave perplexities must beset every student of the Bible who endeavors critically to compare the quotations of the Gospels, the Acts, or the Epistles with the corresponding Hebrew texts of the Old Testament. Whence those verbal deviations from the original? Whence those apparent misinterpretations and apparent perversions? Were the New Testament writers ignorant of Hebrew? Had they before them copies of the Hebrew Bible, often differing from our Masoretic text? Did they more or less frequently quote the Old Testament from an Aramaic translation—the Aramaic being the popular idiom of Palestine in their time? Did they more or less exclusively use the Septuagint version? Were their deviations based chiefly on better knowledge or on misconception? Did they frequently quote from memory? Did they ever intentionally misquote a text, or pervert its meaning in order to adapt it to their notions and beliefs? Were their citations, like those of the Talmudists, generally made only in a fantastically homiletic way? Many similar questions present themselves, and only a minute and comprehensive study can afford the answers. Nor have diligent students been wanting. Only the spirit in which the work was done was not always of the right kind. Most of the examiners started with an apologetic bias, some were hypercritical. Few, only, devoted special works to the subject. Fewer still attempted to go over the whole ground. And the requirements of

the general public, in contradistinction to those of the learned, have hitherto been totally ignored. None of the publications in this field, from Drusius's 'Parallela Sacra,' which appeared three centuries ago, to Böhl's 'Die alttestamentlichen Citate im Neuen Testament,' published in 1878, presents a general view of the texts with precise comparisons.

This Professor Toy does in the work before us, in which he proposed to himself "to discuss all the quotations in the New Testament, . . . to give the original texts with English translation, and as exact an explanation as possible of the various passages, so that the precise thought of the Old Testament may be set alongside of the use made of it in the New Testament, and the reader thus have all the material before him, and be able to draw his own conclusions." And this task he has executed with equal diligence, erudition, and good sense. Every sentence cited from the Old Testament is presented first—for the use of the general reader—in English translations of the Hebrew original, of the Septuagint version, and of the quotation as it appears in the best Greek texts of the New Testament. Then follow—for the more learned or inquisitive—the literal words of all three texts in Hebrew and Greek, and explanatory remarks, exegetical and critical, drawn from the vast range of expositorial and kindred literature. The translations are the author's own, with frequent deviations both from the Authorized Version and the Revised, but with due regard to literalness and the results of the latest research. The critical remarks are generally succinct, and always equally frank and remote from irreverence. The same can be said of the extensive Introduction, in which the author sums up the results of the comprehensive inquiry as to the "formal principles of New-Testament quotation," the "hermeneutical principles," and "the characters of the quotations in the several New-Testament books." This portion of the book is especially valuable, presenting as it does both the various questions as to sources, manner of citing, etc., and the solutions reached by the younger and freer school of critics, to which the author belongs, and whose views he lays before the public. He asks "a careful examination of the grounds on which they are based," offering all the material by which they can and must be judged. The leading conclusions we cannot refrain from placing here, with some of the argument, in a condensed form before our readers, deeming them well supported, and in part fully established, by intrinsic evidence and weight of authority.

The quotations from the Old Testament are never made from the original, but always from the Greek version, or an Aramaic, as is amply proved by the frequent deviations from the Hebrew, and by the general agreement with the Septuagint. It is not likely that the New Testament writers, except the learned Paul, knew Hebrew, which was a dead language in their time; Paul's citations are uniformly from the Greek. Where freedom of quotation does not explain deviations from the Septuagint, the citations may properly be referred to an Aramaic version as the direct source. That version, or *targum*, was probably oral—as were the renderings then generally employed in the synagogues—but well impressed upon the mind by constant use on public occasions. Written targums seem to have first made their appearance about a century after the composition of the oldest gospel, the targum of Onkelos on the Pentateuch being the earliest. The written version of the Septuagint was, in its earlier parts, four or five centuries older. When Paul began to write his Epistles, the Septuagint had long been the authorized version of the Jewish world, including Palestine, though Aramaic was there the vernacular. The text of that version which the evangelists and apostles used differed very little from the best recent texts, based on the Vatican manuscript (of the middle of the fourth century of our era). This manuscript shows no traces of corruption, such as other copies largely underwent at the hands of scribes bent on harmonizing the sacred texts, by conforming the Septuagint to the Hebrew of the Old Testament or to the Greek of the New. The Egyptian translators of the Old Testament, whose version is thus accurately preserved, had evidently before them a Hebrew text independent of our Masoretic, and, on the whole, inferior to it; nor did they always understand their Hebrew original. But they did their work conscientiously, and in a minority of cases in which their readings differ from the Masoretic do theirs deserve preference. To the Septuagint's deviations from the better Hebrew texts, as used in Palestine, and at a much later age collated and perpetuated by the Masoretes, the writers of the New Testament added new modifications, some unintentional, "as would be natural in quoting from memory," and others intentional. There are numerous instances of abridgment and condensation, of expansion and combination of passages.

"The attitude of the New-Testament writers towards the Scripture would account for some of these text changes. For them it was the one thesaurus of truth. They had almost no other books. The words of the Old Testament had become a part of their mental furniture, and they used them to a certain extent with the freedom with which they used their own ideas. They would naturally throw in words, or give turns to expressions, that would bring out the ideas they supposed to be contained in the text. This was the more natural from the peculiar ideas of interpretation which then prevailed, which allowed one to bring out of the Scripture-text any meaning that the words could possibly be made to bear, . . .

"The New-Testament writers, . . . as expounders of religion, . . . belong to the whole world and to all time; as logicians, they belong to the first century. . . . As, without being Greeks, they wrote in the Greek of the day, so (with the exception of Paul) without being rabbinical, they thought in the rabbinical forms of the day. Their Scripture exegesis is substantially that which we find in the Talmud—the same methods and principles, and, to some extent, the same results. In addition to this, they are affected in a special manner by their Messianic belief, that is, by the fact that for them (as was not the case with the Jewish expounders of the Scripture) the Messiah had already appeared, and his earthly career was known. . . .

"Knowing the events of the Christ's earlier career, they could compare them with the Old Testament and find the anticipation of them in the Prophets. . . . All those passages . . . that in any way recalled the experiences or the words of the Master would naturally be regarded as prophetic delineations of him and his work. The current system of Scripture interpretation favored such a use of the Old-Testament material. There was no attempt to fix the historical sense of the Bible with precision. The deeper the reverence for the departed Lord and for the divine word, the greater the disposition to find him everywhere. Anything else would have been unnatural for that time and for those men.

"Interpretation is as really a human and a modern science as astronomy or chemistry; and to demand of the New-Testament writers that they shall practise the historical methods of our day is to wish to tear them from their surroundings, and strip them of their human naturalness. . . .

"We must judge the New-Testament writers by the strictest rules of grammatical and historical exposition. Nor can we pursue any other method with the Scriptural citations of . . . Jesus himself. . . . We may safely appeal to him and his teaching for support when we say that true reverence for his person and teaching is not incompatible with the most thorough and independent investigation of his words. . . ."

In a deeply reverential tone and with perfect critical independence Professor Toy has done his work. He has followed good guides closely, but with discretion and discrimination. Aiming at exhaustiveness, and avoiding bulkiness, he has discarded in his notes all unavoidable references to authorities, and practised a close condensation, which here and there slightly borders on obscurity. The revision of the Hebrew verses quoted is remarkably accurate, the only slip which we have noticed being the omission of the particle *eth* after the words *lō th'nassū*, on page 21. Owing, however, to worn-out type, some of the finer vowel-points, or parts of them, are frequently wanting or almost imperceptible—as, to point out some of the worst instances, in the quotations from Isaiah, on page 53, and from Habakkuk, on page 119. In the "list of works," forming a part of the Introduction, the Latin titles of Gramm's and Bauer's Dissertations require correction. In regard to Matthew's quotation from Zech. ix. (see pp. 50, 51), it is almost obvious that the source of the error was not a false reading *hārī'ū*, corresponding to the Septuagint's κήρυσσε, but *hōdī'ū*, answering to the New Testament's εἰπατε.

A Memorial of John Farmer. By John Le Bosquet. Boston: Cupples, Upham & Co. 1884.

We cannot better recommend this charming sketch to our readers than by quoting the passage in which the author brings himself and his subject together upon the scene (in Concord, N. H.):

"Allusion is made to a schoolboy not twelve years old, of parentage reputable but not rich, his father a tin-plate and sheet-iron worker, living in the neighborhood. One evening, about the close of the year 1822, he was sent, with a quill in his hand, to the merchant doing business directly beneath the apothecary-shop, to ask the favor of the making of a pen; those being days when pens of steel were little known, and those in use grew upon the backs of geese and swans, and the making of a pen was an art in which experts alone excelled.

"The merchant was busy, and said, 'Run up to Dr. Farmer: he will do it.' In a moment the boy was round the corner, up the stairs, and in the presence of the doctor. He was greeted with a kind word and as kind a smile. The doctor's penknife was always in order. Taking the quill, he shaved off about half the depth of the tubular part at the lower end, inner side; fashioned the nib in approved form; exactly divided the point, and cut it off; then slipped the knife along the nigh side of the shaft, clearing off the web, and clipped it near the upper extremity—and the work was done, with an accuracy and despatch which the nicest machinery could scarcely have equalled; the boy looking on with eyes glistening with admiration, it being to him the neatest of sleight-of-hand. 'Now write your name on that piece of paper, and see if you like it,' said the doctor, passing both pen and paper to the boy. The boy made some scratches meant for his name, and the compliment was returned, 'You write pretty well; wouldn't you like to learn to write better?' The boy answered that he would; when his new-found friend continued, 'If you will come in here Saturday afternoon, I will teach you'—that being the only half-day of the week in which scholars in those days had their liberty.

"The boy promised, and was there punctually at the hour. The writing-lesson despatched, he was invited to take a little exercise at the mortar, pulverizing medicine. And, when the business of the afternoon was accomplished, he went away with an invitation to a similar entertainment the next Saturday. . . . And now the favored lad, who had no other employment, was regularly installed as a student and an employee of the scholarly and honored John Farmer, Esq."

"Uncle Remus" himself would not disown this picture. Its particularity and antiquarian discursiveness are characteristic of the entire memorial. Benefactor and protégé grew so intimate as to become bedfellows, and we learn how the indefatigable historical searcher made his toilet in the morning, what his personal appearance was, how he walked, how he folded a

letter, how he used his ruler, what sort of a desk he wrote at and chair sat in, how his shop and his several bed-rooms were ordered, with reference to the points of the compass, what few journeys he took, and many another detail which it would be tedious to mention, though it is all delightful to read about. A more excellent man than John Farmer, or a more amiable, never lived; or, we must add, a more industrious, for the list of his writings and editings, arrangings and indexings, and the tale of his varied activity as secretary of learned and charitable associations, before death overtook him in his forty-ninth year, are amazing, especially if we bear in mind the extreme delicacy of his constitution. The author perhaps hardly emphasizes sufficiently Dr. Farmer's eminence as having, in his 'Genealogical Register of the First Settlers of New England,' made (to use the words of one of his disciples) "the commencement of our national taste for genealogy," and become the father of a literature already vast in the aggregate, and yearly swelling.

To the humanitarian side of his subject Mr. Le Bosquet does as much justice as was compatible with his modest scheme. Dr. Farmer was corresponding secretary of the New Hampshire Anti-Slavery Society, wrote its annual reports, and willed it money. In 1837, writing to the lad, who had meantime graduated from the printing-office to the ministry, he checks a flow of historical reminiscence with—"But I cannot enlarge, as I must say a word on anti-slavery. It was the remark of a good old Puritan minister, that he wished to sweeten his mouth daily with a little of Calvin; so, in like manner, do I find it comfortable for me to dip a little into anti-slavery." He continues: "The Ladies' Society here are sending out petitions to every town in the State. They are before us *men* in the good cause; and I know not [but] that the world would go on better if Miss Martineau's principles of the rights of women (see the chapter on the 'Political Non-Existence of Women,' in her new work, 'Society in America') should be received and carried out." This passage is interesting because his biographer, like so many clergymen of the time, was just then taking alarm at the admission of women to equal participation in the public proceedings and organization of the abolitionists. Mr. Le Bosquet thought this contrary to the Bible, and destructive of the very bases of society, and in the division which followed he joined his cloth in opposing the woman's-rights (Garrisonian) wing. The extract just quoted is proof enough that his old master, had he lived longer, would have kept his equilibrium. Indeed, there was a beautiful friendly relation between Dr. Farmer and the "M. C." (Mary Clark, as we surmise) of p. 73, which made it impossible for him to view the coöperation of the female sex in all good works as anything but natural and praiseworthy. On p. 122, Mr. Le Bosquet seems to imply that Dr. Farmer disapproved of the censure directed against the Church (as "the bulwark of slavery") by his fellow-abolitionists; but the letter of 1834 cited on p. 106 shows him to have been in full accord with them.

We cannot guess how many book-buyers purchase biographies which have no immediate personal interest for them, but to all we would hold up this sketch as a model in style and feeling: a tribute mellowed by the nearly fifty years which have elapsed since John Farmer ceased from his labors.

A Day in Athens with Socrates. Translations from the Protagoras and the Republic of Plato. Charles Scribner's Sons. 1883.

THE "day" which the reader of this charming little volume spends "in Athens" is begun with an early morning visit of Socrates and one of his friends to the sophist Protagoras, "while in the 'Republic,' far on into the night, a group may be found absorbed in the contemplation of justice and the work wrought by it upon the soul." The selections from these two works—for not even the short 'Protagoras' is given entire—are thus in part designed to present a picture of life in ancient Athens. In another sense this book is a supplement to the 'Socrates' of the same author, published a few years ago, in which the aspect under which Socrates is presented is "that of the hero, the martyr, the inspired thinker." In this, and especially in the 'Protagoras,' he appears in a very different light, "in the irrelevant sallies and flights of fancy in which he indulges, in his wilful misconceptions and misleading sophistries, in the tricks which he plays upon his grave and reverend coadjutors, in his determination to get the better of every one else by fair means or foul." The editor questions whether to regard Socrates as "adopting for the moment the eristic method which he elsewhere condemns," or, as represented by Plato, as young and inexperienced. In either case, the essence of his doctrine is not found in these special features, but his aim everywhere appears to be "to force upon men the conviction that a 'life without self-examination is not worth living.'" The practical value of discussions like these and their direct bearing upon the life of to-day are well illustrated in the preface, and we are heartily glad that a work of such tonic power as this is placed in the hands of the young people of America. The translation is every way admirable, accurate, and in racy, idiomatic English, and there are a number of helpful notes.

Oregon: The Struggle for Possession. By William Barrows. [American Commonwealths Series.] Boston: Houghton, Mifflin & Co. 1884.

IF we should insist upon the nature of the series, as indicated by its general title, this volume would seem quite out of place; there is very little of the "American commonwealth" in it. Indeed, Mr. Barrows himself tells us (p. 320) that "this book is designed to be a history of the concession of Oregon, and not a history of Oregon." But even this disclaimer does not fully indicate the divergence of this volume from the presumed design of the series; it is rather a summary of the territorial acquisitions of the United States in the Northwest, with excursuses into the various boundary disputes which have marked our history. The journeys of La Salle and Joliet, the boundary line between Mexico and the United States, the treaties of Ryswick and Utrecht, the travels of Jonathan Carver, the search for the Northwest passage, the "Aroostook war," all these and a variety of other equally remote topics seem to the author to find a practicable pass into the story of Oregon. When he adds to these minor details those more directly connected with his subject, the early discoveries on the Pacific coast and in the interior, the original claims of the five Powers to the Oregon country, the successive retirement of Spain, France, and Russia, the diplomacy of the two ultimate rivals, Great Britain and the United States, and the final success of the United States, but nineteen pages are available for a very meagre account of the real commonwealth, the Oregon of 1859–84. Surely, a little care in condensation might have availed to give us an insight into the influences of the slavery controversy on the admission of Oregon, and an account of Oregon's first quarter century of Statehood.

Very much space is given to the Hudson Bay Company, that remarkable monopoly which for two centuries walled out civilization from the British portion of western North America, and kept it a wilderness, sacred to fur-bearing animals, to their authorized captors, and to large dividends on watered stock. The story of the struggle of American immigration with this hyperborean oligarchy reads almost like a campaign of the Norse gods against the frost giants. There is the same vastness of territory, the same attendant ice and snow, the same mysterious power for evil in the northern enemies, the same conflict between light and darkness, civilization and savagery. But the American frost giants proved to be only a feeble folk when the struggle was brought to a direct issue. When they were fairly pitted against the plough, the log cabin, the school-house, and the missionary, they were run out of the Oregon country with a rapidity which must have seemed miraculous to the trappers and voyageurs, to whom the company and omnipotence had always been practically synonymous terms.

The story of this struggle is the most valuable part of Mr. Barrows's volume. He abandons the threadbare efforts to find or invent title by discovery, purchase, or prescription, and puts the American title on the true ground, of successful colonization. The story, however, is marred by repetitions. The same details are narrated in different chapters, at considerable loss, even in space. Certain pet phrases are reiterated until they become wearisome. In particular "Whitman's old wagon," which led the first immigration to Oregon and showed that the mountain barrier was passable, is dragged into mention at each successive defeat of the company, until the reader is ready to vote it a bore—an injustice for which the wagon, if it still survives, must look for satisfaction to its injudicious herald.

Gli Amici. By Edmondo de Amicis. Milan. 1883.

THE latest work of this brilliant Italian author is in an entirely different vein from his former productions. It is a collection of essays, in two volumes, on "friends and friendship." The subject seems to be a trite one, and to write a book of this kind at a time when men as a rule are too busy to philosophize on every-day affairs, seems a bold attempt. Yet the result is most enjoyable. The author is not a professional philosopher using the phenomena of life to establish some abstract system. He is a man of the world, who has lived and loved, and has had friends among all sorts of people, men and women, respectable and disreputable. Taking his personal experience as a basis, he tells us what he thinks about the way in which friendships are generally formed, and how they are broken: how friends behave in adversity, how they speak of each other behind each other's back, of the relations between young and old men, between men and women. He introduces us to a number of people, and he has a happy knack of characterizing them in a few words so that they become living creatures to us. The power of observation displayed is remarkable, and the book contains material enough for a dozen novels.

There is a tinge of sadness in it—the author has parted with many illusions. But he is far from being a pessimist; his conclusion seems to be that if we are only willing to take our fellow-creatures as they are, and do not ask for too much, this world is a rather comfortable place to live in. That such a disquisition should have been written by the same person who wrote the brilliant works on Spain and Constantinople, shows not only the wide range of his talent, but also what a wonderful instrument for the expression of modern thought is found in modern Italian prose. It has all the precision and brilliancy of French prose with peculiar merits of

its own. In 'Constantinople' are pages brilliant with sunshine, wonders of word-painting worthy of Théophile Gautier; in the 'Amici' the language sometimes reminds us of Montaigne. In France the rigid rule of the Academy would condemn as vulgar a great many of the happiest expressions used by our author. What can be happier, to express great grief, than to say that a person "weeps all the tears of his soul" (*piange tutte le lagrime dell' anima*)? Yet what French author would use in serious prose the equivalent French expression, *pleurer toutes les larmes de son corps*?

When an Italian wrote to Voltaire in defence of the Italian language, and pointed out to him the happy use which was made in that language of augmentatives and diminutives, the Frenchman answered, that they too had used such childish artifices in the infancy of their language, but that they had outgrown them. Old and quaint language is still used in the provinces; but however it may be admired when introduced by George Sand in her rural sketches, and of late in some books of André Theuriet's, it is not known and is not imitated by those who in Paris lay down the rules for the language of civilized Frenchmen. It is different in Italy. When in this century literature revived from its long sleep, and an attempt was made to purify the national language from the French jargon which had crept in, it was perceived how rich a mine existed in the dialects, especially in that of Tuscany, the classic land of poetry and song—the "bel paese là dove il si suona." By some the movement was carried too far, and our author has written elsewhere a very interesting essay on this subject. But, in the hand of a master, the instrument proved to be a wonderful one. A language was evolved, refined yet popular; and in language, as in politics, the real power rests with the people.

The Boys of Thirty-five : A Story of a Seaport Town. By Edward Henry Elwell. Boston: Lee & Shepard. 1884.

THIS little book will captivate young and old. It is a thinly-disguised picture of boy life in "Landsport" (Portland) in Jackson's time, and while much of it is peculiar to the locality, yet a large portion will stand for other parts of the New England seaboard also. Not only in Portland, but in every considerable town, boys were divided into hostile camps by the quarter in which they lived—here the Liberty Streeters, the Gorham's Corner boys, the Down-Towners, etc. Not only to Portland, but to Boston, the Vermont farmer drove his produce down "on runners" in winter. Everywhere in New England the militia muster became as ridiculous, disorderly, and disreputable as in Maine. The noisy Fourth is only just ceasing to be the nuisance which it was then in a far higher degree. It is in and about the harbor that the local flavor of these reminiscences is perhaps the strongest. Mr. Elwell has a light and playful touch, with considerable graphic force and much sympathy with the boyish age. He goes so far in concealing the identity of his set that he even gives himself a pseudonym. It is not otherwise with public characters, except in rare instances. One of these is characteristic enough to be quoted. The boys were playing roly-poly on the sidewalk with a dainty home-made ball of soft leather, stuffed with woollen yarn and india-rubber:

"Ed. Thompson had the ball, and he tossed it into the air just as a gentleman was passing with a small boy at his side. The gentleman caught the ball as it came down, and critically examined it, . . . seemed satisfied with his examination of the ball, and, turning to Ed. Thompson, handed him a four-pence 'alfpenny, gave the ball to the boy by his side, and passed on.

"Ed. Thompson, who was a shy little fellow, stood dumbfounded, while Ben Hunter cried out—

"'That's John Neal, confound his impudence.'"

The Nation.

NEW YORK, THURSDAY, APRIL 3, 1884.

The Week.

THE circular which the Conference Committee of Independent Republicans has sent broadcast over the country is an admirable document. It puts in the right way the influence which all independent voters desire to exert. It calls upon them to make all possible efforts to arouse Republican voters to the necessity of attending the primaries, and securing the election of such delegates to the National Convention as will represent the people rather than intriguing politicians. In case the primaries result in the choice of unsatisfactory delegates, the independent voters are exhorted to take systematic steps for the purpose of laying before the National Convention such evidence of adverse sentiment as will prevent the nomination of candidates who will not command independent confidence and support. The main point at issue is well stated by the Committee in the following passage: "It is universally recognized that success in New York State next fall is vital to Republican success in the country at large. The State can be carried by the Republicans if such candidates are chosen as will deserve to be elected, men whose names will be a warrant, beyond even the pledges of the best party platform, that the cause of administrative reform will be advanced till the separation of the public service from partisan politics is made final and complete. The State cannot be carried by any candidate, whatever his popularity in certain districts, who has used, or who might if elected use, the patronage of office as a reward for personal or party service, or whose past record would put the party on the defensive and compel a campaign of apology or vindication." All the wire-pullers and boomers know that to be an exact and truthful presentation of the case, and we apprehend that the force of it will increase rather than diminish as the days between the present time and the assembling of the Convention pass by. It is the unwilling recognition of this truth which depresses all the boomers now, and makes their work so hollow and, as we firmly believe it will turn out to be at the Convention, so ineffective. It is impossible to believe that a National Republican Convention can be assembled, in this year of reform sentiment, in which there will be a majority of delegates capable of the blunder of nominating a candidate who cannot be elected, especially when it is so clear that all men can see it, that the right kind of a candidate can be elected almost without effort.

The more the action of the Democratic caucus is considered, the less does it appear to be regarded as a victory for Mr. Morrison. At all events, it very clearly prepares the way for wholesale and disintegrating criticism of his bill in the Committee of the Whole. This criticism was started, and its probable effects indicated clearly enough, in a long, and, as usual, able speech of Mr. Hewitt's on Wednesday week on the Bonded Whiskey Bill. In the course of it he took occasion to condemn emphatically Mr. Carlisle's proposal to repeal the tax on tobacco, and to advocate in its stead the total repeal of the tax on whiskey, on the ground that taxation has nothing to do with morality, and that half the alcohol produced in the country is used in the arts, and it is therefore one of our most valuable manufactures. He, however, went far to refute himself as to the connection of taxation with morality by advocating the retention of the tax on tobacco, on the ground that tobacco is a luxury. Now, anybody who selects a thing for taxation because it is a luxury, abandons the ground that you should tax for revenue only, and concedes that you may sometimes tax for other things, because he concedes that the legislator may consider the use made by the taxpayer of the commodity, and his need of it. Whiskey for drinking is not only a luxury but a most pernicious luxury, and the importance of this fact to the Legislature is not in the least diminished by the consideration that it contains a great deal of useful alcohol. It does not follow that you must not tax a thing which a man puts in his belly because other men turn it to account in manufacturing processes, any more than that you must not tax saddle and carriage horses used for pleasure because most horses are used for the transportation of goods.

The Bonded Whiskey Bill was really a proposal that the Government should lend the distillers who have been making more whiskey than they could sell at a profit, the amount of the tax now due, for two years, at 4½ per cent. interest. That whiskey making is a legitimate business is not a good reason why the Government should do anything of the kind; nor is the fact, if fact it be, that if the whiskey men have to pay their tax now, widespread financial disaster will overtake the great whiskey cities and States. Cotton weaving and tanning are legitimate trades, and overproduction among cotton men and leather men causes great financial disaster or depression; but no one would think of proposing a Government loan, to enable either of these industries to tide over troubles caused by the mistakes or misfortunes of the manufacturers. The whiskey men, in short, even if they are as good as other people, must take their chance with the rest of the community. For public encouragement and sympathy they ought not to look. The decisive vote of 185 to 83, by which the bill was defeated in the House on Thursday, must be considered reasonable cause of public rejoicing, all the greater because it was in no sense a party vote. The vote says as plainly as possible that though the country may tolerate the whiskey business, it will not foster it.

The claim which has been set up by the whiskey men, as well as by some others, that the Legislature has no right to discriminate in the matter of imposing taxes for or against any manufacture, on the score of public utility, is a doctrine which we believe no civilized state has ever yet adopted or acted on. All the laws for the regulation of the liquor traffic and for the protection of public health are based on the theory that the state has, or may have, a policy with regard to any commodity the consumption of which may lead to disorder, or be detrimental from a sanitary point of view. The whiskey business, too, has, since the war, created a fresh reason for public distrust and hostility by having made its entrance into politics, as a distinct interest, seeking special protection by every means in its power, good or bad. The mischief wrought by it in this way already is simply incalculable. There is hardly one of the great cities which it has not made almost ungovernable, or delivered over to the rule of ruffianism and profligacy.

The Lasker trouble was brought to an end on Wednesday by the transfer of Mr. Sargent to Russia. The nomination was confirmed at once by the Senate without reference to a committee. This, coming immediately after Bismarck's speech and the invitation of Mr. Sargent to the Emperor's birthday dinner, will, it is to be hoped, prevent any further trouble. It is said that the Administration will not fill the German Legation for some time. This intention, if carried out, would leave the United States in a very dignified position and save the salary of a minister, whose duties can easily be performed by a chargé. The principal use of a minister at a foreign court for us is the cultivation of friendly relations between the countries, and this is especially true of Germany, from which a vast emigration is continually going on to the United States. The idea that Mr. Sargent must be kept at his post because he was "under fire," seems to have found favor only with some of the Southern Senators, who think that no opportunity ought to be lost to teach the Kings and Emperors a lesson. But this feeling has very little hold on the public at large, as the discussion of the matter in the press and in Congress has abundantly shown. It is only indirectly that our diplomatic corps can be made to serve an educational purpose.

The week has been uneventful in general trade circles. With some improvement in the weather there has been a more active inquiry for merchandise, but nothing betokening a real revival. Prices of cotton goods have become firmer, following a small advance in raw cotton, but the demand has not been sufficient to warrant a rise of prices, as it is known that there are large quantities held back by the mills, which will come out on the first fair opportunity. Pig iron is unchanged and the market remains sluggish. There was a further decline in wheat at Chicago, and prices one day touched 80¼ for No. 2 spring cash, but it soon recovered to 83. This decline, coupled with the reduction in railway rates noticed last week, started a heavy movement to the seaboard, but exports have not been much stimulated as yet. Gold to the amount

of $2,200,000 was sent to London without causing any advance in the rate of interest at the banks. Business at the Stock Exchange is almost lifeless, the only demand from the public being for bonds and well-known dividend-paying stocks. The efforts ascribed to Gould, Vanderbilt, and a few other millionaires to draw the public into a speculation for a general advance proved wholly abortive, and have been abandoned. The stock market appears now to stand on its own bottom, the bears being as thoroughly demoralized as the bulls. The general distrust of stocks has led to a more active demand for real estate, both city and suburban property being in good request. Some large transactions on the west side of Central Park have led to the belief that that neglected quarter of the city is about to obtain the recognition which its boulevards and driveways and river scenery have so long invited.

The preparations for increased supplies of wheat which are now going on in various parts of the world, particularly in India, promise a glut in food very like that which we are now witnessing in clothing, and indicate that hereafter the hold of the West on the European grain market will be much less firm than it has been. In fact, there has not been for many years a gloomier outlook for produce bulls. The probabilities are, too, if we may judge from what is passing on the Congo, that the most fertile portions of Africa will soon be pierced by railroads and steamers, and another flood of eatables let loose on the world. What is now needed, apparently, most of all to keep prices up, is more consumers or better appetites. Nothing but a great and rapid increase in the size of families will suffice to keep our farmers and manufacturers out of difficulties, or give any permanent basis for what is called a "bull market." The existing machinery of production is clearly running far ahead of the present normal growth of population in the various civilized countries. Even our system of doubling in twenty-five years, wonderful as it has been considered, will not do; we must double in ten years if we are to keep our farmers and manufacturers out of trouble, or else get the Africans to wear two suits of clothes a year, and take more regular and fuller meals.

In the prevailing business gloom, we take pleasure in calling the attention of our readers to any sign of cheer and hope; and one of the most significant of these lies before us in the shape of a notice that Mr. Emanuel Delmar, late associate editor of the *Commercial Advertiser*, is going to "start a paper." His "salutatory," which is for some reason published in advance, gives the name of the new paper as the *Great Republic*, and fixes the circulation at 200,000 a week, and "as much more as possible." It is to be a large, handsome eight-page semi-weekly, and will appear on Wednesday and Saturday. The name of the editor-in-chief is not given, but his services have been secured, and he is described as "a gentleman and scholar of the highest social and political standing," and a "Republican of national reputation." The *Great Republic* is to be devoted during the coming campaign to the defeat of the dastardly efforts of the Democrats to gain control of the National Government. If we may venture a suggestion, it would be that such a paper ought to be made a daily. A semi-weekly would not terrify the Democrats half as much as a daily. The cost of conducting the paper, Mr. Delmar frankly says, will be "very great," but with a circulation of 200,000 that cannot make much difference. The curious part of the circular is that it contains an appeal for money, to "those personally interested in the success of the party," which reminds the reader a little of Jay Hubbell.

Another chapter of Mr. Blaine's History has got into the newspapers, and there are intimations that others will follow. He seems to have lost all control over it, and to be completely at the mercy of some heedless person who has small conception of what a great historical work really is. The successive publications are used precisely as if they were ordinary campaign documents. Thus the first chapter given out related mainly to Jere Black and Buchanan's administration, and was published in full in the Philadelphia newspapers as being of absorbing interest to the people of Pennsylvania. The second instalment, which appeared exclusively in the *Tribune* of Saturday, relates to the Whig campaign of 1848, and was announced as having a "special relish for New Yorkers," since it deals "with the later career of President Van Buren." Doubtless the work contains other chapters relating to other States, which will follow in due order, and, by the time the Convention assembles, every important State in the Union will be permitted to peruse an entrancing account of its own share in the political annals of the country. We do not remember that any previous historical work has been laid before the world in this way, but the reason may be that no other has had the misfortune to be nearing completion on the eve of a Presidential campaign.

The National Bankruptcy Convention have issued a little pamphlet giving in a few words a statement of their reasons for urging the passage of a bankrupt law. They are able to put the case this year in a stronger light than that in which it appeared at the last session of Congress, for every additional six months of depression of business makes the need of a bankrupt law more apparent. The failures in the United States, they say, were $65,000,000 in 1880, $101,000,000 in 1882, and $173,000,000 in 1883, and yet, with this enormous burden of indebtedness, our laws provide no uniform means of distributing the property of the insolvents among their creditors, or of giving the former a discharge from liability on a surrender of their property. The State insolvent laws are of little or no use, because they are local, and because they have to a considerable extent been framed by debtor communities in the interest of the debtor. The first great stride the United States made in material prosperity was made on borrowed capital, and borrowers were, in much of our early legislation, treated as a favored class. This explains the large exemptions from attachment in some of the States. The system of preferences, too, though not designed to help the debtor, certainly plays into his hands. It enables an insolvent to perpetrate frauds by palming off a transaction, designed to protect his property from his creditors, as a payment of a preferred debt. On the other hand, a State law can give an insolvent no discharge binding in any other State, and the result of this is that a very large proportion of the debts of an insolvent are kept alive for years by creditors who can afford to wait, and hang like a millstone round his neck.

The Judiciary Committee of the Senate has taken a step of some importance towards the solution of the "divorce problem" by reporting a bill for the collection of statistics with regard to marriage and divorce. It provides that the Bureau of Statistics n the Treasury Department shall, under regulations to be prescribed by the Secretary, collect and report all such statistics to Congress. These statistics, if carefully collected, will throw a great deal of light upon the facility for divorce afforded by diversity of State laws and jurisdictions. We have little doubt that half the divorces in the United States would never be granted at all if there were a uniform law extending all over the country, and the number of courts authorized to grant divorces were not so enormous. Marriage in the United States is practically dissoluble at the option of either party. The old legal maxim that the state is a party to every marriage has become merely a pretty fiction, because, in nine cases out of ten, when the time for divorce comes, it is not the State of the marriage to which application is made, but some other State.

Some very interesting views upon the subject of prohibitory laws as a means of suppressing the traffic in liquor have been expressed recently by ex-Chief-Justice Appleton of Maine. He is a teetotaler in principle and practice, and was on the Supreme bench in Maine for more than thirty years. As a result of his experience and observation, he says that while the present prohibitory law of Maine has been of some use in the smaller towns and villages, it has not succeeded in the larger towns and cities, and has failed to accomplish as much in restraining the sale of liquor as a strict license law would have done. He opposes, therefore, the present movement in favor of a prohibitory amendment to the Constitution, first, because an amendment will not in itself accomplish anything for temperance, since it would be of no avail without special legislation in accordance with it, and it would be in the power of each successive Legislature to take such action as it pleased on the question. In the second place, the adoption of such an amendment would annul all existing temperance laws, and an entirely new start would have to be made. Whether he expresses the opinion of a majority of the people or not will be shown in September, when a popular vote is to be taken on the question of the amendment. It is evident, however, that in Maine, as in many other localities in which the temperance crusade has been preached with more zeal than discretion, a reaction has set in, and that there is a grow-

ing sentiment in favor of measures which, while they do not aim at instantaneous suppression, can be depended upon to exert a most beneficial restriction.

The possible effect of the emancipation of woman in infusing into the female character that sort of virility which produces a readiness to shoot at sight, has, we believe, never been considered by the advocates of woman suffrage. They maintain that female virtues will remain just what they have always been, only "more so." Conservatives, however, maintain that as they are clothed with the rights of men, many feminine traits will be lost. The old-fashioned feudal woman always had an excessive aversion to gunpowder; the noise of a pistol or gun being painful to her nerves. She seems, however, in modern times to be gradually growing fond of it; and the ladies who get into "shooting scrapes" explain their connection with them in a way which resembles that of the Southern Colonel or Major. The Countess de Raconska, who had to shoot little Willie Coad in Philadelphia the other day, explains it by saying that her landlady, Willie's aunt, had annoyed her by keeping the gas in their boarding house too low, and making too much noise. She therefore thought she "would fire" next time, and accordingly did so. It looks as if the possession of a revolver had just the same effect on woman that it has on man.

Texas Siftings has some curious particulars about the late Ben Thompson, the noted desperado of that State, recently slain by a brother desperado. He is said to have killed fifteen men with his own hand, and once killed two by successive shots of a revolver, fired in opposite directions, both having him covered with their own weapons, and only showing their heads. His clothes were always fashionable, and he wore $3,000 worth of diamonds. In 1882 he was made City Marshal or Chief of the Police of Austin, but had to take a vacation in June in order to kill a man in San Antonio to whom he owed a grudge. He killed him, accordingly, and was put in prison for it and tried at San Antonio, bail being refused. He was acquitted, of course, but he retained his office in Austin during his incarceration, and, on his return to that city, had the horses taken from his carriage, and was drawn through the streets by an enthusiastic crowd. He was unwell at the time of his death, but people remarked, "Ben is a little bilious, but he will come all right again as soon as he has killed a man." Sure enough, he soon after sought to effect his cure by killing a certain Foster at San Antonio, but Foster was too quick for him. Ben killed him, but not before he had relieved Ben himself of all further pains and aches by a well-directed shot.

Members of Congress who take any interest in "abroad" must be very much puzzled at Mr. Herbert Spencer's reasons for refusing to allow his name to be used as a candidate for a seat in Parliament from Leicester. He says that he could not agree to be "merely a delegate," but would have to act on his own judgment, and would thus be in continual antagonism with his constituents. This, he adds, is because he thinks that legislation ought to be directed to securing to each person without cost "the maintenance of his equitable claims," while his constituents would want something very different from this. Mr. Spencer, if he were an American, would evidently have no such difficulty in going to Congress. With us it is the constituents who want some security for the maintenance of their equitable claims, and cannot get it because the politicians want something else.

The Congo treaty between Great Britain and Portugal has excited scarcely less opposition among the manufacturing and trading classes in England than among those of the Continent. It recognizes the sovereignty of Portugal over a strip of the west coast of Africa embracing three degrees of latitude and including the mouth of the Congo River. Freedom of trade, navigation, settlement, and religion are guaranteed to the citizens of all countries within the prescribed territory, and very solemn undertakings are entered into for suppressing the slave trade, not only in the Congo country, but in all other Portuguese possessions in Africa. The objection raised against the treaty in England is that it puts the country into the hands of a narrow-minded, bigoted, and tyrannical Government, whose administration would probably go far to neutralize the liberal and beneficent guarantees of the treaty. It is contended that the rights of Portugal over the mouth of the Congo are wholly imaginary, and cannot in any event be enforced against other Powers without war. Of course England is not bound to go to war to defend the rights of Portugal, even after they are recognized, but in any complications which might hereafter arise, she would not enjoy the same freedom of action as she would if there were no treaty. Then, looking to the future trade of the Congo Valley, which is now attracting so much attention, the Power which controls the mouth of the river must possess very great advantages, notwithstanding the equality of rights secured by the treaty.

Here is where the British Government expects to find its justification at home for making the treaty. It is necessary that the Congo coast should have a settled government, and that some civilized nation should be responsible for it. Great Britain cannot with good grace seize it by main strength herself. If neither Great Britain nor Portugal establish itself there, some Power stronger than Portugal and more difficult to deal with may attempt to do so. Is it not better, from the English point of view, that a third-rate but friendly Power should be in possession, under color of title, than that the country should fall into the hands of a first-rate and rival Power, or remain exposed to that danger? The treaty has not been ratified, but it probably will be, in spite of the protest of the Manchester Chamber of Commerce and the outcry of the merchants of Rotterdam.

The war in the Sudan appears, as far as the British are concerned, to be at an end, for the Arabs refuse to come any longer within fighting distance. They have evidently had enough of attacking squares with spears. This, doubtless, gives the British their ten miles of coast without much further molestation, but what effect it will have in opening communication with Khartum by way of Berber, and what it will do by way of rescuing the remaining Egyptian garrisons, remains to be seen. The chances are, however, that it will lead to some sort of negotiation and settlement with the principal sheikhs, if not with Osman Digna. As the British proposal is to leave the Sudan, except a small district around Khartum, wholly to the Sudanese, which is what the Sudanese want, there is apparently nothing left for anybody but religious fanatics to fight about. As we have several times maintained in these columns, the Mussulman fanaticism of our day is enormously overrated. Nothing of the old kind which built up Mohammedanism is anywhere discoverable. Turks, Turcomans, Arabs, Persians, Egyptians, all talk very fiercely and threaten dreadful things, till they have actually had some experience of infidel arms; then it becomes rapidly apparent that Paradise is not the near and attainable prize which it was in the early ages of the faith. Wherever the Christian Powers have come in contact with the Mussulman world during the last 150 years, the rapid moral decay of Islam has been increasingly clear.

There is something almost pathetic about the efforts of the London *Spectator* to get the Arabs to behave in what it considers a really becoming manner for picturesque Mussulmans. When Hicks Pasha was defeated, about the middle of November last, it predicted that there would be a rising of the whole Arab world in North Africa, and that "in a month the French would be fighting for their lives from Gabez to Morocco." When the month had elapsed without any trouble, it accounted for the delay by the suggestion that the "swift dromedaries" that were carrying the news had not had time to get down to the coast from the Sudan. It has looked for some time now as if they had fallen lame on the road, or had never started. The *Spectator* has accordingly given up Hicks's defeat as a *causa causans*. It now says that if "Sir G. Graham's force had been annihilated" the other day, "as for ten minutes seemed possible, the Arab world would have been in arms, and some twenty millions of the only Asiatics who have the courage and inherent brain power of Europeans, would have again stormed out of their secluded fastnesses to found an Arab Khalifate." It is amazing what an attraction speculations of this sort have for minds which love sensation. It ought to be obvious to the writer of the above that a race with the capacity and energy to found a Khalifate to-day, would not need to have its power revealed to it by the massacre of two or three British regiments, even if they were "the Black Watch and the Marine Brigade." The great constructive races do not discover their capacity by accident, or relapse contentedly into barbarism because Sir Redvers Buller "got round on their flank" with the Second Brigade.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, March 26, to TUESDAY, April 1, 1884, inclusive.]

DOMESTIC.

THERE was great excitement in Cincinnati last week over the fact that a jury had found William Berner, who had confessed to deliberate murder, guilty of manslaughter only. On Friday afternoon he was sentenced to twenty years in the penitentiary, and deputies started secretly with him to Columbus to put him in the prison there. On the way he managed to elude a mob at Loveland, and escaped from custody. The citizens of Cincinnati believed him still to be in that city. On Friday evening a mass-meeting, attended by 10,000 people, passed resolutions condemning the disgraceful verdict. As soon as it adjourned, about ten o'clock, the crowd moved to the jail to lynch Berner. The riot alarm summoned the whole police force to the jail. The crowd, under a leader, began work on the jail door. Several shots were fired without effect. By 11 P. M. the mob had succeeded in entering the prison. At 11:30 the First Regiment Ohio National Guard entered the jail, and at midnight thirty musket-shots were fired to scare the mob. The glancing balls wounded four persons. Lew Kent, one of the mob, was killed when the door between the reception-room and cells was broken down. This checked the mob, and they slowly retired. For two hours they endeavored to set fire to the building, but failed. The crowd threw stones and fired pistols at the windows, and the militia fired from the windows at the crowd. A score or more were wounded, several fatally. Later the crowd broke into the Veterans' Armory and Kittredge's gun store and procured arms. By the time this was done, however, the crowd had so thinned out that no further serious attempt was made, and at half-past three o'clock on Saturday mroning quiet was restored. Berner, the murderer, after a most eventful experience, was recaptured and landed in the penitentiary at Columbus, secretly, on Saturday night.

The rioting was renewed in Cincinnati on Saturday night and Sunday, with terrible effect. On Saturday evening the mob turned its attention from the jail to the Court-house, which was supposed to be fire-proof. A small squad of police patrolled the sidewalk in front of the building, and for a time kept the rioters from approaching. But the police were forced from the front of the building and back along the Court Street side. Then the doors of the Treasurer's office were broken down with a heavy piece of timber, used as a battering-ram. The militia then charged the mob. Falling back a few steps, the rioters made a stand and fired upon the troops, killing a captain. The mob then pressed forward into the Court-house and set fire to it in several places. Many valuable records and the law library, one of the finest in the country, were burned. All attempts of the Fire Department to reach the fire were prevented. Twice a charge was made, to give them access, but the people were wedged into the streets and alleys so closely that no impression could be made upon them. Men were killed and others wounded in each charge. The idea of the mob seemed to be to destroy wholly the building which it was their belief was only a shield to criminals. When the fire was at its height, three rounds of twelve shots each were fired from behind a barricade at a dense crowd on South Court Street with deadly effect. A scattering fire followed. This aroused great indignation against the militia. At 3 o'clock on Sunday morning the police captured a cannon and dispersed the mob at Fourth and Walnut Streets without firing a pistol. They have shown remarkable bravery throughout the crisis.

On Sunday the Mayor left his sick bed to direct the work of securing order. A proclamation was issued and all good citizens were requested to rally to the preservation of peace. Governor Hoadly ordered every militia regiment of the State to Cincinnati. The rioting, however, continued during Sunday. A crowd was charged upon by the militia at noon and two were killed. All the afternoon there were threatening demonstrations and occasional shots were heard. At 9 o'clock in the evening the firing in the vicinity of the Court-house was again resumed, the militia trying to disperse the mob. Several persons were shot. Briggs Swift, a wealthy business man, was shot and seriously wounded. Reports of the casualties up to Monday night put the killed at 42 and the wounded about 120.

There was some rioting during the early hours of Monday morning, but by 9 A. M. quiet was completely restored and the militia were in full possession of the city.

All was quiet in Cincinnati on Monday night and during Tuesday. The Municipal Reform Association, composed of citizens of all parties, issued on that day a manifesto to the voters of the city, stating that they believed the occurrences of the past few days more than ever demanded the severance of party politics and municipal government; and also stating that they would place in nomination for the various offices to be filled at the approaching municipal election men of irreproachable integrity and undoubted qualifications for the positions, who have consented to accept the nominations merely from considerations of public duty. Such a ticket was announced later in the day.

The President on Wednesday sent to the Senate the nomination of Aaron A. Sargent, now Minister to Germany, to be Envoy Extraordinary and Minister Plenipotentiary to Russia in place of the late Mr. Hunt. On the same day the Secretary of State sent him the following telegram: "The President approves entirely of your course in the Lasker matter. You have done nothing but obey the instructions of this Government therein. The President, thinking it would be agreeable to you, to-day nominated you as Minister to St. Petersburg, and your nomination, without reference to any committee, was immediately and unanimously confirmed by the American Senate. This action manifests an appreciation of your worth, and does you an honor of which any citizen may well be proud." Mr. Sargent has declined the Russian mission and will return home. He fears the Russian climate and has pressing duties in this country. It is believed that the German mission will not be filled for some time.

President Arthur sent to Congress on Wednesday a special message urging the appropriation of money to reconstruct the navy.

Cardinal McCloskey and other eminent Catholics of the United States brought to the attention of the President several weeks since the action of the Italian Government in the matter of the proposed sale of the Propaganda property at Rome, and requested the good offices of the Government of the United States in behalf of the American College. By direction of the President, the Secretary of State addressed a note to Mr. Astor, the United States Minister at Rome, instructing him to lay the facts in the case before the Government of the King of Italy. On Friday he replied that the American College had been exempted from the sale.

The Senate on Wednesday passed Mr. Dawes's bill providing for granting lands to Indians in severalty. On Friday the Senate passed the bill authorizing the Secretary of the Navy to issue a proclamation offering a reward of $25,000, to be equitably paid or distributed to any ship or ships, or person or persons not in the military or naval service of the United States, that shall discover or rescue, or satisfactorily ascertain the fate of, the Greely expedition.

The House Navy Bill, as amended by the Senate Committee, was reported to the Senate on Monday. The House refused to appropriate money for the armament of the new cruisers; the Senate Committee gives $400,000. The House refused to appropriate money for the completion of the monitors for harbor defence; the Senate Committee gives $2,000,000. Finally, the House refused an appropriation for additional steel vessels for the navy, although every one admits that such additional ships are necessary and ought to be built as soon as possible; the Senate Committee appropriates $2,500,000 for this purpose.

After a debate of six days the bill to extend the period during which whiskey can be kept in bond was defeated by the House on Thursday, the vote being 83 to 185. The majority is much larger than was expected, and the distillers are very angry.

The House Committee on Coinage reported unanimously, on Thursday, a bill providing that until June 1, 1886, trade dollars shall be received at their face value in payment of all dues to the United States, and shall not be again paid out. The trade dollars received are to be recoined into standard dollars, and are to be treated when received at the mints as silver bullion, and their bullion value shall be deducted from the amount of bullion required to be purchased and coined by the act of February 28, 1878. The bill was passed on Tuesday, with an amendment striking out the deducting clause.

The House Banking and Currency Committee on Tuesday morning instructed ex-Governor Dingley to report his bill, which authorizes the Secretary of the Treasury to invest the lawful money deposited by national banks to redeem circulation in such bonds as he may deem for the best interest of the Government, and to hold or dispose of such bonds as the necessities of the redemption fund may require.

The third trial of the suit of Hallet Kilbourn against ex-Sergeant-at-Arms Thompson, of the House of Representatives, for false imprisonment, resulted on Wednesday in a verdict, at Washington, of $37,500 in favor of Kilbourn.

During March the public debt of the United States was reduced $14,238,324.

There was a very exciting time in the New York Assembly on Wednesday, when Mr. Roosevelt's series of bills to correct abuses in New York city offices were special orders for the day. Speaker Sheard allowed opportunity for a Democratic member to demand that the order of third reading, for a number of bills already on the table, be observed. It took a two-thirds vote to set this aside, and the necessary number was lacking. The Speaker ruled, also, that a suspension of the rules would be necessary to make the city bills a special order for another day. This seriously endangered their final passage. The Republicans then resorted to other tactics and were met by Democratic filibustering, the result of which was that the Roosevelt bills were considered in Committee of the Whole when a quorum was not present, and they were, by doubtful parliamentary rulings, saved for another sitting of the Committee of the Whole. Speaker Sheard was subjected to severe criticism for his course, but he affirms that he is a friend of the city reform bills, and will do nothing to delay them.

In the evening the bill making the President of the Board of Aldermen elective was passed. The Senate passed the General Surface Railroad Bill without further amendment. A bill giving a cable traction street railway company certain rights in the nature of a big monopoly was summarily killed in the Assembly on Thursday.

A bill was passed in the Assembly on Wednesday regulating the sale of oleomargarine and other substitutes for butter. Its main feature is requiring the conspicuous posting of notices.

The Roosevelt bills for correcting abuses in the New York city government were consid-

ered in Committee of the Whole on Tuesday by the Assembly, and were advanced, several being ordered to a third reading.

The New Jersey Assembly on Monday night rejected the woman's suffrage law by a vote of 24 to 27.

Augustus Schell died in this city on Thursday at the age of 72. He was graduated at Union College, and practised for 20 years at Albany. He took an early interest in politics and became a power in Tammany Hall. In 1856 he was appointed Collector of the Port of New York. He has been prominent in railroad enterprises since 1862, and for many years was an officer of the Western Union Telegraph Company. During the reign of the Tweed ring Mr. Schell partly withdrew from Tammany Hall, but was elected its Grand Sachem in 1872, after the downfall of the ring. In 1877 he ran as a candidate for the State Senate, but was defeated by John Morrissey. Since 1872 he has been President of the Historical Society.

FOREIGN.

The British infantry on Wednesday were encamped nine miles from Suakim. The march thither was painful on account of the intense heat. Three hundred men fell out of the ranks. The cavalry with fifty Arab scouts went during the day to reconnoitre Tamanieb. Colonel Stewart sent messengers ahead to parley with the rebels, but they were fired upon. A lively skirmish then ensued for two hours. Several of the rebels were killed. The cavalry finally retired slowly, amid the jeers of the enemy, who held a strong position at the rugged and rising ground which forms the end of the valley near Tamanieb. The evening and night were cool and afforded the troops a grateful rest. At 3:30 o'clock on Thursday morning reveillé was sounded and the troops were got in readiness to advance on Tamanieb.

At 5 o'clock the march began. The cavalry were in front with the infantry following in echelon of brigade squares, with the guns between the brigades. The firing opened at half-past seven, and was brisk on both sides, the rebels firing from the cover of rocks. The English cavalry and mounted infantry led the attack upon them, and drove them from their shelter into the hills. When General Graham came up with the infantry and guns, shells were thrown after the flying rebels. The cavalry pursued them, and the village of Tamanieb was burned to the ground. There were no British casualties. The loss of the rebels is unknown.

Orders were sent from England to General Graham on Thursday to return from the Sudan immediately with his troops. He arrived at Suakim with the cavalry that evening. The infantry reached there on Friday, and the Tenth Hussars, the York and Lancaster Regiment, and the Irish Fusileers thereupon embarked for home.

General Graham, with his troops, sailed from Suakim for Suez on Tuesday. The latest advices respecting Osman Digna were that he had encamped in the vicinity of Tamanieb, having about 1,0 0 followers and many sheikhs, and that he was preparing to give battle to the tribes friendly to the English. On Monday evening the rebels approached to within a mile of Suakim and looted the cattle. The inhabitants of Suakim are discontented and angry at being left by the British to take care of themselves.

Colonel Kitchener and Major Rundle started from Cairo on Thursday to coöperate with Captain Chermside in negotiations for the opening of the road to Berber. Telegraphic communication between Berber and Shendy was restored on that day. Five hundred natives will be sent to open the Berber road.

The sheikhs of tribes numbering 5,000 people and living in the district between Suakim and Kassala, came in on Friday to Suakim and promised to assist in the capture of Osman Digna.

Hassan Bey, the commandant at Kassala, has sent word to Massowah that the Kassala garrison has food and munitions for one month. He asks to be relieved by an English force. Admiral Hewett, with Captain Speedy and Consul Mason, will start from Massowah this week on the mission to King John of Abyssinia. They will meet the King at Adulis.

Unfounded rumors were prevalent in Cairo on Friday that Khartum had fallen.

A rumor was current in Cairo on Sunday that General Gordon surrendered Khartum some days ago to a sheikh representing El Mahdi, and that three days afterward he and his secretary, Colonel Stewart, were arrested and imprisoned. Later accounts of the sortie on March 16, where the rebels were encountered near Halfaya, say a charge by the enemy's cavalry put Gordon's 3,000 men to flight. Two hundred of them were slaughtered and three guns were lost. Two black Pashas, whose treachery caused this defeat, have been court-martialled and shot.

Advices from Gordon, dated March 23, assert that ample supplies were arriving at Khartum. Two emissaries of El Mahdi had arrived with drawn swords and declared that El Mahdi did not recognize his appointment as Sultan of Kordofan. El Mahdi advises General Gordon to become a Mohammedan. Armed steamers daily engaged the rebels, who lost heavily. Gordon and his friends were daily expecting the arrival of British troops.

A Cairo despatch on Tuesday reported that General Gordon had finally decided to abandon his policy of conciliating the natives, having become convinced by repeated failures that it is utterly useless. His new policy will be more vigorous.

It is asserted in Paris that Earl Granville has asked the Powers to assent to an English protectorate over Egypt for five years, on the basis of the maintenance of the nominal suzerainty of the Sultan of Turkey and the observance of the international treaties, England guaranteeing to order Egypt to meet her financial engagements. Austria, Germany, and Russia have assented under certain conditions. France opposes the scheme.

Mr. Gladstone was at his post again in the House of Commons on Monday.

In the House of Lords on Friday night the subject of state-aided emigration to Canada was discussed. Lord Derby said that emigration was increasing at its own natural ratio without any adventitious aid, and he declined to pledge the Government to any measures involving monetary aid.

The putting of the war-sloop *Alert*, recently presented by England to America to participate in the Greely search expedition, in commission on March 25, at London, was becomingly celebrated. Mr. James Russell Lowell, the United States Minister, hoisted the American colors at the *Alert's* peak. Fifty guests lunched on board, among whom were the Earl of Northbrook and Lord Alcester. The *Alert* sailed for this country on Saturday.

Prince Leopold, Duke of Albany, fourth and youngest son of Queen Victoria, died suddenly about 2:30 o'clock on Friday morning, at Cannes, where he had gone for a few days' recreation. On Thursday evening about 6:30 he fell on the steps of a club house there and struck upon his head, but was able to write a despatch to the Duchess, his wife, immediately after. Doctor Royle, who was sleeping in the Duke's room that night, was startled by the patient's heavy breathing. He approached the bedside, saw the Duke was in a fit, and immediately summoned Captain Percival. The crisis was of short duration. In six minutes the Duke expired in the arms of Captain Percival. The cause of his death was epilepsy. Funeral services, attended by the Prince of Wales and forty distinguished persons, were held on Tuesday, and the body was then taken to Cherbourg, on the way to England.

The Duke of Albany was born April 7, 1853. He studied at Oxford, was made a D.C.L. in 1876, received a grant of $75,000 a year on attaining his majority, and $50,000 more on his marriage in 1882 to Helen, daughter of the Prince of Waldeck. They have one child, Princess Alice, born February 25, 1883. The Duke was the most studious of the Queen's children, showed considerable ability as a writer and speaker, was the author of 'Travels in Italy,' 'The Polarization of Light,' and several musical compositions. He has always been delicate.

Queen Victoria was profoundly affected by the news of her son's death. She was visited by the ex-Empress Eugénie, who warmly sympathized with her. On Saturday the Queen and the Princess of Wales went to Claremont to visit the Duchess of Albany. Telegrams of condolence were received from the rulers of Europe and from President Arthur through Minister Lowell. The marriage of the Princess Victoria of Hesse, niece of the Duke of Albany, has been postponed on account of his death.

The raising of a general fund is contemplated to meet the exigencies of the Parnellites. Mr. Parnell expects, under the present franchise, that his party will be able to carry seventy-five seats in Parliament at the next general election. Candidates, he says, will be required to give a pledge that they will sit, act, and vote with the Irish party, or resign. It is necessary, he believes, to provide eligible candidates for Poor Law Guardians. In his opinion £40,000 would be a sufficient fund to cover election expenses and to secure the constant and efficient attendance of the Irish members in Parliament.

Nicholas Trübner, the well-known London publisher, is dead, aged sixty seven.

Prime Minister Ferry spoke on the Madagascar question in the French Chamber of Deputies on Thursday. He said that it was hoped that the negotiations which had been resumed with the Hovas would result in a treaty. He concluded: "If, however, the pending negotiations fail, we shall spare no effort to reduce the Hovas to submission." The Chamber of Deputies adopted, by a vote of 430 to 32, an order of the day to maintain France's rights in Madagascar and to refer to a special committee the Government's request for a credit.

A scheme for the revision of the French Constitution will be submitted by the Cabinet in May to the Chamber of Deputies.

Of the new French Budget Committee, fourteen members are hostile to the Cabinet, seven support it, and the views of eleven are doubtful.

The French police have discovered a secret dynamite factory at Tulle.

General Millot telegraphed from Tonquin on Monday that, after the capture of Hung-Hoa, the troops would return to France. Auxiliary native regiments will be organized to defend Tonquin.

Prince Bismarck, it is said, will retire from the Prussian ministry and devote his whole time to the affairs of the Empire. Herr Von Puttkamer will succeed him as Premier of the Prussian Cabinet.

The German Reichstag adjourned on Thursday for the Easter vacation. The political parties are preparing for the general election, which will probably turn on the law against the Socialists.

It is asserted that the Pope has notified the Emperor Francis Joseph, of Austria, that he will leave Rome at a more or less early date.

The Spanish Cortez was dissolved on Tuesday, and a new one will assemble on May 20th.

Prof. Elias Loennrot, the distinguished philologist of Finland, is dead.

THE CINCINNATI RIOTS.

THE state of things which has led to the Cincinnati riots is of long standing. For many years the difficulty of procuring the conviction of murderers in Ohio has been increasing, owing to the frequent changes in criminal procedure made by the Legislature in the most haphazard and reckless way, and almost always with the view, or at least with the effect, of multiplying the murderer's chances of escape. The result has been the creation of an amount of legal confusion through which it is impossible for the best judge to steer his way in the conduct of a trial, without leaving the defence plenty of "points" for an appeal and new trial, or for some kind of delay. Delay, of course, however caused, in capital cases always increases the criminal's chance of impunity.

In Hamilton County, which contains the great city of Cincinnati, the evil effects of all this are more apparent than elsewhere. Murderers are very numerous, and the punishment of murderers is rare. In fact, we believe, only one murderer has been hanged since 1866, and this a colored man. There was a disposition at the indignation meeting, out of which the riot grew, to throw the blame of it all on the "criminal lawyers," who were denounced in unmeasured terms. But tricky and unscrupulous criminal lawyers, skilled and successful in saving murderers from the gallows, do not show themselves, or, at all events, do not become a power for evil, if the criminal procedure does not afford a good field for the display of their peculiar talents. There is no use in blaming them, any more than in blaming the flies which settle on a carcass left in the highway. They get criminals off because the state of the law supplies them with plenty of materials to work with.

These remarks may not seem to apply to the case of Berner, which has given rise to all these troubles, because he escaped through the verdict of a stupid or corrupt jury, and not through successful legal chicane. But the popular indignation which broke forth on his escape has been long growing, under the spectacle of impunity enjoyed by crime through the agency we have been describing. The verdict of the Berner jury was simply the last drop in the cup. And it must be remembered, too, that no matter from what class we take jurors, they must be more or less affected by the attitude of the community in which they live towards crime. Nobody who has been long familiar with the spectacle of unpunished murder can, no matter how sound his principles may be, regard murder with the horror which it ought to inspire, and every man must be influenced by this indifference when he comes to sit in judgment on murderers.

In the riots at Cincinnati there is really nothing new or extraordinary. It is an old, old story, that when a body of men begin in a large city to do deeds of violence, no matter how respectable they may be, or how good their motives, they are apt to degenerate into mobs which revel in mere destruction for destruction's sake. These outbreaks of pure savagery in the great centres of civilization are very awful phenomena, but there is no large city in our day in which they may not occur. It is well to know this, and absolutely essential to bear it in mind in framing municipal government. But the popular discontent out of which the riot in Cincinnati grew has one lesson, and a very impressive one. Everything in our political machinery, including judicial procedure, is supposed, in the American theory, to be constantly supervised by the voters. Every officer, high and low, is supposed to carry on his work under the watchful eye of the people, and the people are constantly exhorted to vigilance by the press. But, as a matter of fact, our political and judicial arrangements are all made as if the people had nothing to do but watch their working; as if there were no farmers, or traders, or manufacturers, or doctors, or lawyers, or mechanics in the United States; as if we were all men of leisure like the Athenians, who could sit in the market place all day and talk politics. Our elective offices are made as numerous and the elections as frequent as if every American citizen was a political "worker," with nothing to do but make up lists of candidates and inquire into their fitness, and see, after election, how they came up to the expectations entertained of them. Our criminal procedure is made so complicated that no layman can follow the thread of a trial, or tell, when criminals escape by the score, how it happened or who is to blame. The jury trial is, as every one knows, a system with some serious imperfections, of which the most serious is the juryman's want of intelligence or want of practice in following long and complicated narratives or trains of reasoning. Nevertheless, we allow the continuance in this State and, we believe, in most others, of a rule of law which permits a murderer to exclude from his jury anybody who has read about his crime in the newspapers and formed an opinion about it. In other words, we try to make up his jury out of the dullest, most ignorant men in the community. This abuse has been exposed a thousand times, but no effort is made to correct it. So has the extreme complexity of criminal procedure, with the large number of opportunities it affords to delay or defeat justice by technical objections which have no bearing whatever on the merits of the case; but every Legislature is allowed to tinker it as it pleases so as to make it more complex.

It is to this difficulty which the people have in finding out what is the matter and who is to blame, that we owe the increasing readiness all over the country to resort to violent or extra-legal modes of setting things right. In the government of the great cities the difficulty is greater than elsewhere, because the whole machinery of society is there more rapid in its movements. Crimes are more frequent, courts and officers are more numerous, and everybody has but little time for supervising anybody's business but his own. The action of public opinion in public affairs is consequently but feeble at ordinary times, and wrongs go on till they become intolerable, and there is either a popular "rising" almost amounting to a revolution, as in this city in Tweed's day, or a great lynching movement, as in Cincinnati on Saturday. The moral of it all is that what we need to aim at in all our reforms is simplicity of machinery, so that popular supervision may be intelligent and constant. In other words, our institutions should be adapted, especially in the cities—as they now are not—to the needs of a busy people, and not to those of an idle one; for no matter how much we preach to men about neglect of their political duties, they will persist in regarding government as a contrivance for promoting their happiness, and will refuse to believe that they live in order to carry it on.

THE LOGAN CAMPAIGN.

A RATHER lively contest is in progress in the State of Illinois for delegates to the National Republican Convention between the supporters of General Logan and those of Mr. Blaine. There is apparently a residuum of political force, especially in the city of Chicago, which is opposed to both, but is not settled in favor of any other candidate. This embraces probably the bulk of those whose votes were cast for Mr. Washburne in the last Convention. The Chicago *Tribune* recently admonished this unsatisfied element to desist from their opposition to Logan, in order that the vote of the State might be cast as a unit first for Logan and afterwards for somebody else. It would appear from this that the *Tribune* does not look hopefully forward to General Logan's nomination, but expects him to be a "favorite son," and to have valuable trading capital when the break comes. Latterly there have been some spirited contests between the Logan men and the Blaine men in the rural districts, resulting generally in Logan's favor, but it is not certain that he can count upon the entire vote of the State.

General Logan has stumbled up to very near the head of his class in politics by dint of perseverance, self-confidence, good-fellowship, and active wire-pulling. He entered public life a quarter of a century ago as a follower of Stephen A. Douglas, whom he resembles in many ways. He has all the courage and pugnacity of Douglas, with only a small share of the latter's mental resources, but this deficiency he makes up in part by a better moral endowment. Through all his stumblings since he became a Republican, there can be discerned a desire to be thought well of by the sober-minded and religious portion of the community. Whenever he has been convinced that any course or policy which the "boys" were inclined to follow would bring him into permanent disfavor with this class, he has abandoned it. He is a very keen observer of the drift of public opinion, and he has become by study and practice a much more steady-going sort of person than his first steps in public life gave promise of. He is not a reformer in any sense, yet he is not one of those who sneer at reformers. He believes in the "boss system" because it is an apt instrument for his purposes, but he would prefer to get on by more reputable means if it were practicable to do so. Personally he is a hearty, jovial, and engaging, but not exactly a "magnetic" man. Nature made him a soldier and a politician, but neither nature nor art ever destined him to be a statesman. As a wire-

puller he has no superior, yet he is not a dangerous member of the class. He prefers good methods of government to bad, but he considers his own methods good because his intentions are to promote the public well-being through the elevation of Logan to the Presidency.

In point of education, training, solidity of parts, mental grasp, and the general equipment so desirable in a Presidential candidate, General Logan is so seriously deficient that his nomination would be looked upon in the Eastern States as something altogether *outré*. Nevertheless, regarded as a foil to Blaine, he has merits not to be overlooked, and the contest going on in the State of Illinois for delegates to Chicago thus acquires a sort of national interest. Thus far Logan has had decidedly the best of it, and if he carries the bulk of the delegation, he will have detached from Blaine an important part of his former Western support. It is evident that a large part of the strength which the former has gained comes from those who look upon the latter as a great mischief maker and firebrand. Probably the adhesion of Mr. Bluford Wilson, ex-Solicitor of the Treasury and ex-prosecutor of the Whiskey Ring, to the Logan forces is to be accounted for on these grounds. It is generally believed that Logan is the safer man of the two—that he would not, for instance, endanger the peace of the country by a meddlesome and irritating foreign policy. His "war record" is so good that he is under no necessity of going to war to make it better. His peace record is marred only by such incidents as the "back-pay grab" and the Arrears of Pensions Bill, a too hasty mastery of political economy, and too little mastery of the parts of speech. His errors of grammar have helped to make him a great favorite with the "boys," who like to see a man dash ahead in spite of all obstacles which the mother tongue can put in his way. As a member of the House he was a leader at a time when Thaddeus Stevens, Winter Davis, Garfield, Butler, Schenck, and Blaine were there. His force was much like the exuberant energy of a wild horse. What he lacked in the way of acquirements he made up by explosive earnestness. Few members could command a larger following than Logan when he was in a fit. His translation to the Senate was a damage to him. The Senate is not a good theatre for the display of emotion. It sobered Logan, but it also suppressed him. It brought his defects into relief and gave no scope for his steam-power. He is not qualified to take high rank as a debater, but as a headstrong fighter and neck-or-nothing partisan he has few superiors. Although an adept in the arts of political finesse, there is nothing sinister in him. His patriotism cannot be called in question, but it is largely of the Young America sort, and Young America seems now to be going out of fashion.

In addition to the votes of Illinois, General Logan will probably pick up delegates here and there in places where the soldiers are organized politically. The Grand Army of the Republic is supposed to be devoted to his interests. This is a secret society. It has commanders, and drills, and posts, and encampments, and other fanfaronade. It is an organization whose strength has never been tested. We suspect that it does not amount to much as a political force. We fancy that Johnny O'Brien or John F. Smyth could give it odds in this State and come out winner. Nevertheless, what votes it has to give are properly bestowed on General Logan. He has carried the flag in peace as well as in war. He has got more money out of the Treasury for soldiers and claim agents than all other politicians combined.

THE NEW GERMAN PARLIAMENT.

THE Lasker trouble with Prince Bismarck gives increased interest to the composition of the new Reichstag, to which he refused to transmit the American resolution of sympathy. It is reported to contain 51 out-and-out Conservatives—or old Tories, as they would be called in England—(we have nothing corresponding to them here, having had no middle ages in this country); 24 Imperialists or Liberal Conservatives; 106 of the Centre, mostly Ultramontane; 18 Poles; 44 National Liberals; 106 German Liberals, made up of a coalition of the Secessionists and Progressists; 9 Democrats; 13 Socialists; 15 Alsatians; and 18 "Savages," or free-lances, attached to no group in particular.

The most important of all these groups, and the only really new one, is that which has taken the name of "German Liberals," created by a fusion between the Secessionists and Progressists. The Secessionists were that portion of the old National Liberal party which seceded from it under the lead of Lasker, Bamberger, and Stauffenberg, when it undertook to follow Benningsen in sacrificing its principles and independence by going over to Bismarck's majority. The Progressists have long been the most active and aggressive section of the Liberals, and their leader, Richter, has been one of the most formidable of Bismarck's opponents and critics in debate.

The programme which the new party has published indicates a distinct and probably formidable revival of parliamentary politics in Germany, which so many feared had disappeared for long years when the National Liberal party broke up in the last Reichstag. It calls for the establishment of an effective constitutional régime, guaranteed by Ministerial responsibility and complete parliamentary control. With a view to establishing and maintaining such a régime, the German Liberals will support annual appropriations for the revenue, and not, as Bismarck would wish, triennial or quadrennial; freedom of speech; universal, direct, and secret suffrage; the exemption of members of Parliament from accountability to anybody but the House itself for words spoken in debate; liberty of the press, of meeting, of association, and of conscience; and the subjection of all religious corporations to the common law. They also will oppose Bismarck's state socialistic schemes, and labor for economic and social reforms through individual initiative, and they ask for a reduction in the term of military service, and for complete parliamentary control of the peace footing of the army.

The new party is supposed to muster about 110 votes, and will be led by Richter, perhaps now the ablest German debater. It is still far from having a majority; for this about 193 votes would be necessary. But it is tolerably certain of recruits from the Democrats, Socialists, and Alsatians, from all of whom it differs mainly in professing loyalty to the Emperor and to the existing form of government. In the meantime, it is much stronger than any other group or section, and will hold the balance of power in any difference between the Ministry and any other. The official and conservative view of the coalition is that both of the elements which compose it were distinctly hostile to the reigning dynasty before it took place, and are so still, and that their present professions of loyalty are simply a hypocritical concession to the well-known monarchical feeling of the great body of the people. The principal change they propose would involve, it is said, the suppression of the Federal Council, and their clamor for liberty of the press and of meeting is, in view of the fact that this exists already, the merest cant. That the party will accomplish much, either in bringing about legislation or in changing administrative customs in Bismarck's lifetime, is not likely. He could no more adapt himself to real parliamentary institutions than the late Emperor Nicholas, who confessed frankly that any change in his system of government would kill him. There is no power in the state capable of compelling him to submit to anything of the kind, or of driving him permanently from office. The existing régime will, doubtless, therefore last his time; and it is all the more likely to do so because everybody knows it will not survive him. Nobody but him could keep it going, and he could hardly do it if he had not a sovereign in full accord with him.

The function of the new party during his life-time will, therefore, be mainly the preparation of public opinion for maintenance of real parliamentary government after his death, and in doing such work it is no small assistance to an opposition to have a minister as powerful and as imperious as he is, to be resisted and criticised. The present political régime in Germany has been often compared to that which existed in England under the Tudors and the first two Stuarts. But the value to Englishmen of the Tudor and Stuart resistance to parliamentary government, in clarifying their political ideas, provoking discussion, and teaching them the power of patience and self-restraint, was simply incalculable. In the same way there can be little doubt that parliamentary institutions in Germany are finding in their chief antagonist their greatest helper.

THE OPPOSITION TO THE PARLIAMENTARY FRANCHISE BILL.

LONDON, March 20.

ALTHOUGH, during the three weeks that have passed since the new Franchise Bill was brought in, public attention has been chiefly fixed on the Red Sea coast, and but little has been said about the bill, there can be no doubt that the debates on it will be the chief pitched battle of the session. Notice has been given of several amendments to the second reading, the most important of which, as coming from a leader of the Opposition, is that of Lord John Manners. He asks the House of Commons to "decline to proceed with a bill adding two million persons to

the electors of the United Kingdom, until it has before it the whole scheme of the Government for the amendment of the representation of the people." This is an assertion of the view which the Opposition have frequently hinted at, that the question of extending the franchise cannot be separated from that of the redistribution of seats. The Tory party cannot directly resist the extension of the suffrage in counties, because they are the county party, and do not like to seem distrustful of their own laborers, and because it was they who so largely extended the borough franchise in 1867. But they have grave misgivings as to the effect of the measure, and would gladly see it shelved. This movement on the flank is therefore more convenient than an attack in front would be, and they hope to receive the support of a certain number of cautious Liberals who entertain similar misgivings. The nature of these misgivings, so far as they affect England, I will now consider.

The two million persons whom the bill proposes to invest with the Parliamentary franchise fall into two classes—firstly, workingmen engaged in manufacturing or mining in the industrial counties, together with those workingmen who are substantially townspeople, but live outside the Parliamentary boundaries of London and a few others of the largest towns; and, secondly, agricultural laborers in the rural districts. The first class are substantially the same as the town workingmen who have enjoyed the franchise since 1867. As these have acquitted themselves creditably, returning members no worse than the old £10 householders used to return, it is hard to say why they should not be admitted to the franchise. So far as they differ, they differ a little for the better, for they are not thrown together in such vast masses, and mostly live under slightly more favorable conditions of decency and comfort. The agricultural laborers are almost an unknown quantity. Nobody can tell whether they will think and vote for themselves, or merely follow the lead of the landowners and farmers who employ them. Probably they will follow in most cases; but here and there, where trades unions have accustomed them to joint action and given them a taste of independence, they may assert themselves. There are already some few places where they do vote—places which are called boroughs, but are really agricultural districts; and in these places they vote with as much sense and self-reliance as the factory hands or the small shopkeepers. As a class, they are no doubt ignorant, despite the improvements in popular education of the last thirteen years; and they have but little knowledge of public affairs, meeting one another and talking about things less than townspeople do, and reading newspapers much less. If one were in the mood for discussing seriously whether they are fully fitted for such a function as the Parliamentary franchise, there might be much to say against their claims. But this is not the mood of either political party at the present moment. The idea has gone about that they must have the franchise, and no one who should argue against it would be listened to.

What, then, is the source of the misgivings referred to? It is this: The addition of these 2,000,000 of new voters will place the county seats in the hands of the working class, the class which has admittedly the least education and the smallest stake in the country. The borough seats are already in the hands of this class. Therefore, it is argued, you are now putting the whole Constitution at the mercy of one class. Supreme in the towns, they will now be supreme in the rural districts also. Hitherto the restricted county franchise has enabled rank and wealth to hold their own, because county members have usually been the leading representatives of the land-owning class. Now, however, there is no security that such a state of things will continue. If any question arises which unites the whole working classes of the kingdom, a question in which the interests of the poor are opposed to those of the rich, the poor will command all the constituencies alike, and be able to overbear the upper classes altogether. It is, moreover, a danger in a country like ours, where the House of Commons is omnipotent, being unrestrained by any written constitution, that a temporary impulse should be too strong, and should put one party or the other in a majority so large as to carry it quickly over all obstacles. Hitherto the dissimilarity of different constituencies, and the fact that in the rural ones the influences of property predominated, have kept up a sort of balance between parties. Now, however, when the county elections are to be decided by large numbers of poor voters belonging to the same class as those who control the towns, what is to prevent all the constituencies from being swept away at once by the same storm of feeling? The defeated party will be left in a minority so small as to be practically powerless.

Those who argue thus do not suggest that the county franchise ought not to be extended. That contention has been dropped, because it is supposed, or admitted, that the artificial distinction between county voters and town voters cannot be maintained. What they demand is that some precautions should be taken, in the redistribution of seats which must follow the extension of the franchise, against this evil of overwhelming majorities. Suppose, they say, a general election held when some question is exciting the working classes. Under the new system a majority is obtained by one party in three-fourths of the constituencies. In many of these constituencies the majority may be a small one. Perhaps it is so small that you have, out of 4,000,000 of persons voting, 2,200,000 on one side and 1,800,000 on the other. The majority of voters is only 400,000. Yet the majority obtained by the victorious party in the House of Commons is three to one, and the wretched minority is obliged to submit to whatever the majority, so large that it can refuse even to listen, may dictate. These are dangers to which every representative system is open. They have been kept off in England hitherto by the varied character of our constituencies, in which there have been small boroughs as well as big ones, and county seats which the territorial magnate could and did call his own. But if you cut the county up into what are practically equal electoral districts, all showing a large predominance of working-class voters, you expose us to them in the most serious form.

The Tory party naturally believes itself specially exposed to such dangers, because its strongholds have been in the counties and the small boroughs. It is therefore very sensitive on the subject of redistribution. No doubt most of the seats taken away from the small boroughs will have to go to the counties, because the latter will receive a vast access of voters. But these new county voters may not, it is surmised, prove as loyal to the territorial aristocracy as the present voters, who are largely farmers and shopkeepers, have done. Hence the anxiety to know what scheme of redistribution the Government will propose. If it should prove a sweeping one, there will be all the more reason for endeavoring, by postponing the Franchise Bill, to postpone redistribution also. Now, the fears of the Tory aristocracy are, as usually happens, shared by the Whig aristocracy. They extend, also, to a section of the Liberal party which is composed partly of rich men who dislike all change, partly of doctrinaire politicians who live in the fear of what they call the "tyranny of the majority." These groups are casting about for some means of preventing the extension of the franchise from too completely democratizing the country. A society has been formed, called the Proportional Representation Society, which has been joined by about one hundred Tory and eighty Liberal members of the House, in the hope of discovering a scheme whereby the strength of a political party in Parliament shall represent, not the number of constituencies in which it has triumphed, but the total number of its adherents in the country; or, in other words, whereby a minority which has been defeated in a great many localities, but is in the aggregate considerable, because defeated in those localities by few votes, shall have a number of members in Parliament proportioned to the total vote it cast in the country. No satisfactory scheme for this purpose has yet been worked out; for the method now applied to some large towns and a few counties, of allowing the voter to vote for fewer candidates than there are seats to be filled—say for two persons when there are three seats vacant—has not won public favor by our fifteen years' experience of it. It does not seem probable that these Liberal proportionalists will go so far as to vote against the Government. They may confine themselves to trying to extort concessions from it, while seeking to persuade the country by their speeches. But the question of redistribution so much dwarfs in men's minds the question of the franchise, on which they have primarily to vote, that the coming debates are likely to turn mainly upon it. Meanwhile the Government is weakened by other causes, and the Opposition thereby emboldened to lay a foundation, by vigorous efforts against the Franchise Bill in the Commons, for its rejection by the House of Lords. Y.

FLAUBERT'S CORRESPONDENCE WITH MME. SAND.

PARIS, March 13, 1884.

IT was, I believe, Mr. Henry James who once called our modern school of novelists the grandsons of Balzac. There is much truth in the expression. The great unit has been divided into many fractions. Flaubert, Daudet, Zola, may all be called grandsons of Balzac: if he had not existed, one feels that they would not have existed. They all investigate the world which, in some senses, he has opened for them; they are all incomplete and fragmentary, essentially one-sided, while Balzac is "ondoyant et divers," as Montaigne said—capable of any sort of adaptation, full of sympathy for all the manifestations of human activity. Has it never struck you that, while the grandsons of Balzac chiefly devote themselves to the analysis of evil passions, Balzac alone has understood that virtue also can be born and develop itself with all the character of a passion; that it lives not only at the dictation of duty and of religion, but can be the fruit of instinct, and follow its blind course toward the sublimity of sacrifice? The successors of Balzac can show us the slaves of vice, such as Mme. Bovary, or Nana, or the Kings in Exile; Balzac can show us conjugal love, maternal love, friendship, self-sacrifice in a dramatic form, as passions, as instinctive forces. In his 'Cousin Pons,' in the 'Parents Pauvres,' in so many other wonderful works, if some are, so to speak, chosen for evil, some also are chosen for good, and the dramatic effect is produced by the natural play of opposite passions, equally strong, equally irresistible. When we read the modern novels, we are constantly struck by the absence of the virtu-

ous element, considered as antagonistic to vice; its absence produces a sensation of monotony which amounts to dulness. The naturalistic school is not in reality true to nature: it paints the dirty pavement; it forgets that there is a sky above. The contrasts of Balzac are unconscious; they are not prepared by any literary or philosophical theory; they are the contrasts of life itself, which is never one-sided and has no sameness.

Gustave Flaubert was one of the grandsons of Balzac. He was born on the 12th of December, 1821, at Rouen. His father was an honest and successful doctor, and was director of the Hôtel-Dieu of that town. His mother was the daughter of a country doctor. Nothing in the atmosphere of Normandy, or in his domestic life, prepared him for literature; he was, however, prevented from choosing any active career by an infirmity which, curiously enough, remained unknown till very recently. M. Maxime DuCamp, one of Flaubert's friends, has revealed to the public, in his Literary Notes, that Flaubert was subject at times to epileptic fits. Living, as he did in his youth, in fear of an attack of his malady, he filled his hours of leisure with literary work. His début was his great triumph: it was 'Madame Bovary.' The novel appeared in numbers in a review called the *Revue de Paris*, which was one of the numerous short-lived and unsuccessful rivals of the *Revue des Deux Mondes*. This *Revue de Paris* had for its editor M. Laurent Pichat, and Maxime DuCamp was one of its influential writers. M. Guy de Maupassant, who belongs to the more modern naturalist school, has lately told the secret history of 'Madame Bovary.' He has published a letter, in which M. Maxime DuCamp told his friend Flaubert that he must submit his novel to mutilation. "You make your début by a work *embrouillée*, in which the style is not enough to produce interest. Be brave, shut your eyes during the operation, and believe, if not in our talent, at least in our experience in this sort of thing, and in our affection for you." The work was to be done "by a practised and clever person." It was necessary, according to Maxime DuCamp, to cut out all the scene of the wedding, to suppress, or at least to abridge considerably, the scene of the "comices." Flaubert, when he received the letter of DuCamp, wrote on the back "Gigantic!" And all the public, which has been taught that 'Madame Bovary' is a *chef d'œuvre*, is ready to endorse this sentiment, and to say in turn "Gigantic."

The press has been very hard on M. DuCamp; I confess that I feel more discontented with him for his revelation of the hidden infirmity of his friend Flaubert than for his confidential literary advice. The naturalists have invented a new religion; must we admire everything in their work? Will it be a crime of "lèse-majesté" to suggest the slightest change in a manuscript of Monsieur de Goncourt, or even of Zola? I can hardly believe so. I think that some changes of 'Nana,' some mutilations made with a very bold and unmerciful hand, might have been very useful to the author. They might have left a powerful work, an awful lesson, which any man or any woman of a certain age might have read; while, as it is, 'Nana' is a book that cannot be mentioned or discussed in any decent society: a work which must be kept under lock and key, and which belongs to the "enfer" of any library.

I remember the impression which 'Madame Bovary' made on me at the moment of its appearance. It was not pleasant; it gave me a painful sensation. I was almost ashamed of feeling interested in it; still, I was interested. I admired the clear, cool exactness of the description of Norman scenery, the analysis of mean, prosaic, humble vice; but I could feel no interest in Mme. Bovary, though she struggled against the provincial stupidity. She seemed to me as vulgar as the people who surrounded her; her conception of love, of happiness, was mean. "Still," M. Guy de Maupassant tells us, and it is partly true, "the apparition of 'Madame Bovary' was a revolution in our letters."

Flaubert was a discontented mind, without any degree of creative genius or imagination. His horizon of thought was immense, it was boundless; but he had not the faculty of condensing his ideas. We may be sure that Mme. Bovary once existed: Flaubert did not create her, he copied her with the exactness of a photographer. All his other works are a complete failure. 'Salammbô' is no longer read: it is a futile epic attempt, a series of long descriptions, which pretend to be what they cannot be, minutely exact. His philosophical work, the 'Éducation Sentimentale,' is unreadable; his 'Bouvard et Pécuchet' was a fatiguing encycl pædia "de omne re scibili." The curious notes given by M. de Maupassant concerning the numerous works on which the mind of Flaubert was engaged, show a sort of unbounded and sterile ambition; but we find nowhere in them the trace of a type, the lineaments of life. The mind of this father of naturalism was always lost in abstractions; he had a great respect for art, and respected nothing but art, but he was not an artist. He had, I repeat, no creative power. 'Madame Bovary' is the only work of his which survives, and there is no invention in it. Flaubert had too much intelligence not to understand the great defect of his own nature; he was discontented with himself, he felt his own sterility, he kept amassing materials for books which he could not write. He consoled himself with the spectacle of the imbecility of mankind, and delighted in the endless manifestations of this stupidity. He was kind, adored by his personal friends, but he lived too much out of the world. The applause of his *familiers* was too loud, and deceived him. He belonged to a little school of mutual admiration, which professed to ignore the great affairs of the world, and despised politics. He lived much alone, and spent the greater part of his life on his little estate of Croisset, near Rouen. He saw the ships going up and down the river, the spires of the old capital of Normandy, the banks of the Seine.

M. de Maupassant, who belonged to Flaubert's *cénacle*, publishes his letters to Mme. Sand, and these letters deserve to be read. Flaubert shows more of himself in them than in his last compendious works. The correspondence begins in 1866 and continues till 1876. It is extremely free in its tone; it is clear that Flaubert spoke to Mme. Sand as he would have done to himself. He liked her as if she had been a man, and treated her as such. His devotion to her was absolute: she became, so to speak, his confessor. He did not take an attitude before her, he showed his own self. The letters, on account of this extreme sincerity, are very interesting. They are very painful also. Flaubert had a sort of nervous sensibility which was hardly to be expected in such a strong-built, gigantic man; he cried easily, he had fits of despondency and of melancholy, which became more and more prolonged. He had conceived for his own time, for the higher as well as for the lower classes of French society, a sort of insurmountable antipathy which at times became repulsion and horror. The political ideal of our time was a mere absurdity in his eyes, and he was confirmed in his contempt by the events of the last years of the Empire, by the commotion of 1870, by the Paris Commune.

"I believe," he writes in 1871, "that we shall appear extremely absurd to posterity. The words republic, monarchy, will make posterity laugh, just as we laugh at the words realism and nominalism. . . . A modern republic and a constitutional monarchy are identical. . . . As for the good people, 'gratuitous and obligatory' instruction will be the end of it. When everybody is able to read the *Petit Journal* and the *Figaro*, everybody will read no more, since now the bourgeois, the wealthy gentlemen read nothing else. The press is a school of stupefaction, since it dispenses people from thinking. . . . As for universal suffrage, it is the curse of mankind: as it is constituted, one element predominates to the detriment of all the others. Numbers triumph over mind, instruction, race, and even money; money is better than number."

He often recurs to this subject. The greatest need, in his eyes, is not the instruction of the poor, it is the instruction of the rich, and of the bourgeois, "who know nothing, absolutely nothing." Is it worth while to raise the unfortunate workingman, the innocent peasant, to the level of idiocy of the bourgeois, of Prudhomme? "The three degrees of instruction," he says after the war of 1870, "have testified of themselves in one year: (1) Superior instruction has given victory to Germany. (2) Secondary, middle-class instruction has given us the men of the 4th of September. (3) Primary education has given us the Commune. The Commune had for its Minister of Public Instruction the great Vallès, who professed to despise Homer. . . . In three years all Frenchmen will be able to read. Shall we be more advanced? Imagine, on the contrary, that in each village there was a man well versed in finance and political economy, and that this one man was respected; things would change." With such ideas, it is not to be wondered at if Flaubert was fond of Renan; his mind, like Renan's, was aristocratic. He believed in no political creed, in no vague declaration of rights; he believed in science. "Philosophy," he says, "will always be the privilege of aristocrats. In vain do you feed the human cattle, and give hay to its belly, and gild its stable: it will always be brutish." He thinks at times that politics is a thing of the past: "In the eighteenth century the capital affair was diplomacy. The 'secret of the Cabinets' did really exist. This order of things seems to have said its last word in 1815. Since then we have done little else but dispute on the exterior form which must be given to the fantastic and odious being called the State." In his horror of parliamentary government, Flaubert spoke sometimes with envy of the government of the mandarins; and, curiously enough, you will find somewhere in Renan a defence of this same government, which, he says, has kept China from falling to pieces for four thousand years.

Universal suffrage seemed to Flaubert even more stupid than divine right. "The people is an eternal minor, and will always be so, since, in the hierarchy of social elements, it represents numbers, the unlimited. What is it to me that many peasants should know how to read, and should listen no longer to their curé? It is of infinite importance to me that many men like Renan and Littré should live and be listened to. Our salvation can only be in a legitimate aristocracy." The war of 1870 was a terrible blow to Flaubert: it disturbed not only his life but his mind. The Prussians occupied his little house at Croisset; he kept repeating in his letters: "Je meurs de chagrin." The Commune did not surprise him, it justified his worst fears and his misanthropy. "I am not," he says, "like the bourgeois; after the invasion, I find that there is no further misfortune. The war with Prussia made on me the effect of a great disturbance of nature; the insurrection of Paris is, in my eyes, a very clear and almost simple thing."

Paris had always seemed to him to be mad. "All in it was false—false realism, false army, false credit, and even false *catins*. They called themselves marchionesses, and the great ladies called themselves familiarly 'cochonnettes.' The prostitutes who remained in the tradition of Sophie Arnould, like Lagier, seemed horrible. But you have seen the respects of —— for the Païva. And this falseness extended to every judgment. An actress was vaunted, not as an actress, but as the mother of a family. People would have it that art should be moral, philosophy clear, vice decent, and science popular." This passage would probably have delighted Carlyle.

The last years of Flaubert were filled with physical sufferings, an invincible melancholy—what he calls the sentiment of the universal uselessness of things—perpetual and almost painful doubts as to his own work, as to the books which he wrote, and which bear the mark of a morbid state of mind. The letters to Mme. Sand explain Flaubert much better than he has ever been explained before by his admirers. He was capable of greater things than would appear from his works. There was in him a certain want of proportion, of weight; he had no measure. He was extreme in his dislikes as well as in his affections; his sincerity was always placed like a screen between himself and the world. On the whole, he had not much in common with the present school of realists and naturalists. As the author of 'Madame Bovary' he may be called the father of naturalism; but he was also the last of the Romantics.

Correspondence.

"MARGERY'S LOVERS."

To the Editor of The Nation:

Sir: I agree with you that the dispute about the originality of "Margery's Lovers" is "curious"; and as you have given a summary of the case as it is known in England, I beg that you will kindly print the letter which I have addressed to Mr. Moy Thomas, of the London *Daily News*, with such comment as the letter and the appended correspondence may seem to you to demand.—Yours truly,

Brander Matthews.

121 East Eighteenth St., N. Y., March 27, 1884.

"Moy Thomas, Esq., *Daily News*, London, Eng.

"Dear Sir: When the critics do agree about the stage, their unanimity is wonderful, as I have occasion to know, in spite of the three thousand miles I thoughtfully put between us several months before 'Margery's Lovers' was produced. When the merit of my play is discussed, I am willing to sit 'all silent and all damned'; but when its originality is questioned, I ask a hearing. A despatch in the New York papers of February 26th first told me that I was accused of 'gross literary theft,' in that my play, 'Margery's Lovers,' was a copy of the MS. of 'Hearts,' a play by Mr. H. P. Stephens. I had, perforce, to await the details of the accusation before I could meet them specifically; but I published a formal denial at once. A second despatch in the papers of March 2d gave you as a possible arbitrator, and I telegraphed you immediately: 'Deny Stephens's charge plagiarism emphatically. Shall prove "Margery's Lovers" written '78.'

"To-day I have received the paper containing Mr. Stephens's correspondence with Mr. Cecil, Mr. Clayton, and Mr. B. C. Stephenson; and I write now to deny Mr. Stephens's accusation absolutely and emphatically. I have never seen Mr. Stephens's play; I know nothing about it; I never heard of it before, and I was quite unaware of its existence. If a denial can be framed more sweeping than this, I am ready to subscribe to it.

"'Margery's Lovers' is an entirely original play—except in so far as it may be indebted to the Grog Davis, of Lever's 'Davenport Dunn,' for a few stray hints of the character of Margery's father, and except also that the device of the marked cards was suggested to me by a chance newspaper paragraph. This indebtedness once confessed, my play is wholly my own. It is original in its construction, its situations, its characters, and its dialogue. It was written in the last months of 1878. Since then it has not been altered by me, except by condensation and cutting. In January, 1879, it was read by Mr. Lester Wallack, and later in the year by Mr. A. M. Palmer and Mr. Augustin Daly. Mr. Wallack is in Florida and Mr. Palmer is in Europe; I append a letter from Mr. Daly, and another from Mr. H. C. Bunner.

"It seems to me that this shifts the burden of proof upon Mr. Stephens's shoulders. I should like to know when his play was written? If his play in any way resembles mine, I should like him to explain the similarity. He declares that there is only one MS. of 'Hearts'; unfortunately there are several MSS. of 'Margery's Lovers'—and one of these was lost, strayed, or stolen, in England, late in the summer of 1881. I append a note from Mr. Charles Coghlan, showing that he read my play in June, 1881, that he sent it to Mr. Edgar Bruce in August, 1881, and that neither he nor I have ever seen that MS. since.

"It is needless to dwell on the difficulty of meeting an outrageous accusation like this when I am three thousand miles away, and when four weeks must elapse between the charge and the answer. I expect to be in London in June, but I hope to receive before then an apology from Mr. Stephens, and a formal withdrawal of his wanton accusation. Until I do receive these, I shall not rest satisfied.—Your obedient servant,

"Brander Matthews.

"New York, March 7, 1884."

THE COLONIZATION OF THE CONGO VALLEY.

To the Editor of The Nation:

Sir: It is to be hoped that no other civilized nation will follow the example of Great Britain in recognizing the claims of Portugal to any portion of the Congo Valley. I can imagine no greater misfortune for that fertile region than to become a Portuguese colony. It had better, almost, remain unexplored and unopened forever. Having had the bad luck to reside for some time in a Portuguese colony, I speak from experience, and I say without hesitation that the very worst system emanating from any European government (excluding Turkey) is the Portuguese colonial system.

The Island of Madeira is one of the loveliest and most fertile spots in the world. The prodigality of Nature seems to have been exhaustless in showering upon that lovely isle every treasure of climate, scenery, and produce-bearing soil. Day after day, from January to December, the sun shines there in all his splendor, tempered to a grateful warmth by the cooling breezes of the surrounding Atlantic. Almost to the height of Mt. Washington towers the grand Pico Ruivo, from whose base sweeps away many a forest-clad valley and tinkling cascade. Roses and geraniums, heliotropes and violets, grow in wild profusion along the roadsides. Grapes and coffee, sugar and nectarines, oranges and wheat, strawberries and custard-apples are but a tithe of the products which this goodly land offers to the most careless cultivator. Surely this was meant for the garden of the world! Here indeed should we find the "arva, arva beata!"

For more than 450 years this island has been a Portuguese colony. To-day, its inhabitants are among the poorest, the most ignorant, and the most profoundly wretched in the world. Aye, the most profoundly wretched! for they live without hope. They know that so long as Portugal remains a power in Europe their lot can never be bettered. It could not be made worse. The treatment of Madeira by Portugal is a specimen of how the Congo colony would fare should it ever come under the rule of that rotten oligarchy at Lisbon.

Let us see what Portugal does for one of her oldest colonies—the one which should be the brightest jewel in her crown. I think I may safely say she does nothing but rob her. The Civil Governor of Madeira is appointed from Lisbon; so is the Military Governor; so is the director of the Custom-house. And what these three officials cannot squeeze out of the island is not worth squeezing. The squeezing is principally done by means of that extortionate engine with which, alas! we are only too familiar in the States—a custom-house, and the usual attachment of weighers, gaugers, inspectors, laborers, appraisers, deputy-collectors, examiners, chief collector, and percentage to the bosses. I was about to say the Portuguese tariff was worse than ours; but that would be impossible. It is very similar to it. It is so constructed that the rich man pays comparatively nothing for his luxuries, while the poor man pays enormously for all the common necessaries of life. It is estimated that by means of the Custom-house and other methods there was taken from Madeira, in 1882, more than $200,000, after paying the expenses of administering the island—and this from a population of 130,000.

What the American laborer considers the necessaries of life, and what he is well enough off to get in spite of the tariff—these the Madeira laborer simply does without. His wages (a day-laborer) are 33 cents a day. His clothes—the meanest and cheapest cotton stuff, of which the tariff shuts out all but that manufactured in Portugal—are generally rags, and often little more than *nil*. His house is a hovel unfit for a dog. He has absolutely no furniture. His wife works in the fields, and before she is thirty is an old woman, worn out with manual labor and insufficient nourishment. His children are stunted, wretched, and diseased. The Government prevents him from emigrating when a young man by demanding six years' army service, or a $300 bond for his return. He probably never had 300 cents at one time in his life. His diet is corn meal and sweet potatoes, varied with a morsel of fish, upon which, by the way, the Government levies a heavy tax. Last year the destitution in Madeira was so great that the authorities, to save the people from actual starvation, were obliged to remit for a few months the import duty on corn, whereupon the price fell at once 40 per cent. But it was of little use. The people used to tell me they had no money to buy it, even when free of duty.

Madeira is most advantageously situated for coaling steamers from Europe to West African ports, the Cape of Good Hope, and South America. The harbor, however, needs a breakwater to render it safe from southerly winds which blow with much violence in the winter time. The Government will do nothing toward building the breakwater, but does its best to drive away shipping by heavy tonnage dues and fees.

This, sir, is a true picture of a Portuguese colony after more than four hundred and fifty years of "government." There is no reason to believe the Portuguese would do better on the Congo. The colonies they already have on the west coast are said to be disgracefully misgoverned. Supposing them to have "police boats" (I think that is the word) and a Custom-house at the mouth of the Congo, how much American commerce would find its way up there? I am no admirer of this Administration, yet I cannot but commend to our merchants the position President Arthur took upon the Congo question in his message. If we intend to maintain that position, we must have a navy, the money for which is, unfortunately, little likely to be forthcoming in the present position of parties in this year, when we are cursed with a Presidential election.

L. Du Pont Syle,

Late United States Consul in Madeira.

1614 Summer Street,
Philadelphia, March 29.

PROFESSOR ZELLER ON CLASSICAL DISCIPLINE.

To the Editor of The Nation:

Sir: Votaries of the college fetish, if there still are any among the readers of the *Nation*, will find some comfort for their superstition in an article by Professor Zeller in the March number of the *Deutsche Rundschau*. The essay is entitled: "Ueber die Bedeutung der Sprache und des Sprachunterrichts für das geistige Leben." After remarking upon the close connection between language and thought, and deducing from this the peculiar disciplinary value of linguistic study, the essayist comes to a matter which is just now disturbing the German no less than the American mind—the question, namely, of the absolute and the relative educational worth of the Latin and Greek languages. Zeller evidently has faith in the traditional education, and he scores his first point against an "eminent man of science" who had described that education as still occupying the "mediæval standpoint." (And, by the way, have not we too heard something of "mediævalism" in education?) The Berlin philosopher's comment upon this is, that during the Middle Ages there was no classical philology. Classical studies were born of humanism, which was a reaction *against* mediævalism; and it was precisely these studies which gave the "mortal thrust" to the mediæval type of culture.

The essay then considers the idea of substituting German and French for Greek and Latin in the higher education, and finds the proposed substitution not advisable: because, first, if any living languages are to do the educational work that has historically been done by the Latin and Greek, then modern language and literature must be studied with the same thoroughness that has long been brought to bear upon the ancient. But, our history being what it is, real thoroughness in modern philology will be forever impossible without some knowledge of Greek and Latin.

Secondly—and here Zeller finds the really decisive ground for the superior educational value of the ancient languages—the classics actually do more than living languages ever can do for mental culture. The boy who is learning Greek or Latin never has any definite goal of perfection in his imagination. He does not think of any end to his arduous journey. So he is content to be accurate and scholarly with regard to the day's pensum. Thoroughness concerning the matter in hand becomes his ideal, since his mind is not distracted by doubts as to whether this or that point is not after all unimportant in relation to some ulterior aim. In the study of a living language, on the other hand, the pupil usually has before his mind a somewhat definite ideal of perfection—namely, to speak or to read (often with a particular purpose in view) the language he is studying. He learns to make scholarship subordinate to this practical end. His ideal is not to be thorough, but to get along; and since he is not concerned to understand, but only to be able to imitate any linguistic usage, he is likely to miss that severe logical gymnastic which is offered by the study of the classics.

Is not Professor Zeller's argument in the main sound? The hardest task in teaching is to break the conceit and the mental flippancy which come of a little knowledge or of a preconceived notion that the thing to be learned is "easy." This notion prevails and must continue to prevail in regard to the German and French languages. There are always persons in the community who "speak" these languages; there are other persons who are ready to impart a handsome knowledge of them in little or no time. There is, in short, a preconception, impossible to get rid of, that German and French are light accomplishments, not to be made much of in the acquisition. No such preconception exists in regard to the classics, which have for ages been looked on as a treasure difficult of access. It seems to me probable that if we were to venture upon the general experiment of trying to make German and French do the work of Greek and Latin, there would result in the course of a few generations a distinct weakening of mental grip in the most highly educated class. The only question is, whether such a disaster would be counterbalanced by compensating advantages. Zeller thinks it would not, and that is also the opinion of

Yours respectfully,
Teacher of German.

Ann Arbor, March 22, 1884.

Notes.

A. C. Armstrong & Son announce for early publication a 'Complete System of Theology,' by the late Dr. Henry B. Smith, edited by Professor Karr, of the Hartford Theological Seminary, a former pupil of that eminent scholar.

A volume of lectures by Dr. R. S. Storrs, on 'The Divine Origin of Christianity, as Indicated by its Historical Effects,' is in the press of A. D. F. Randolph & Co.

T. Whittaker will publish in one volume a new and cheaper edition of Lacordaire's 'Conferences,' and the 'Prophecies of Isaiah,' by the Rev. T. K. Cheyne.

Ginn, Heath & Co. have in press a 'First Book in Geology,' by Prof. N. S. Shaler, of Harvard; a 'Hebrew Lessons: a Grammar and Reader for Beginners,' by H. G. Mitchell, Ph.D., of Boston University; a 'Handbook of Latin Writing,' by Henry Preble and Charles P. Parker; a 'Vocabulary to Cæsar's Commentaries on the Gallic War,' by J. B. Greenough; a 'Method of English Composition,' by Prof. T. Whiting Bancroft, of Brown University; 'Essentials of Spanish Grammar,' by Prof. W. I. Knapp, of Yale, and 'Practical Method for Learning Spanish,' by Gen. A. Ybarra; the following volumes, additional to the "Pedagogical Library": (II.) 'Methods of Teaching Ancient Languages and Literature,' (III.) 'Methods of Teaching Natural Science,' (IV.) 'Methods of Teaching Reading, English Literature, and Language'; the following, additional to the "Library of Anglo-Saxon Poetry": 'The Riddles of Cynewulf and the Battle of Maldon'; and Scott's 'Lady of the Lake,' annotated, in the series of "Classics for Children."

'Sappho,' Alphonse Daudet's new novel; 'The Clew of the Maze: Modern Scepticism and How to Meet It,' by the Rev. C. H. Spurgeon; and the 'Memoirs of David Brainerd,' edited by the Rev. J. M. Sherwood, are on the list of Funk & Wagnalls.

Mr. S. R. Koehler's valuable 'United States Art Directory and Year-Book' is, we are glad to hear, about to appear again, and with many improvements. A novel feature will be a large number of illustrations, most of them full-page. Cassell & Co. will be, as heretofore, the publishers.

The Women's Christian Temperance Union is undertaking the preparation of "scientific temperance" text-books, for use in schools where the study of physiology and hygiene prevails or (as in Vermont, New Hampshire, New York, and Michigan) is made obligatory.

An English translation of Cornelis Vosmaer's 'Amazone,' from the third Dutch edition, will be published by T. Fisher Unwin, London, with the frontispiece designed by Mr. Alma-Tadema.

Captain Marryat is perhaps to have a new run in this country. The Harpers have added 'The Pirate, and Three Cutters' to their Franklin Square Library.

Outing for April contains an illustrated article by "Karl Kron," concerning a recent bicycle trip in Nova Scotia, in which this indefatigable rider (and chronicler) added several hundred miles more to his already long tally. In fact, he is now prepared to receive subscriptions (in addition to the 1,000 secured without public announcement) for a work, 'Ten Thousand Miles on a Bicycle,' to be published in August. Much of the contents will consist of the writer's contributions to "wheeling" and other periodicals during past years, but much also will be new, and the whole will have the merit of being a practical route-book for the wheelman. To this end it will be elaborately indexed—not only for places, but for objects of curiosity. The information as to transportation, etc., will be of the same useful nature; and by a wide distribution of the book it is hoped to make it so accessible that it need not be literally a *vade-mecum*. The price of this unique publication will be $1.00. Mr. Kron's address is University Building, Washington Square, N. Y. City.

Jules Moinaux's 'Les Deux Sourds' forms No. 9 of W. R. Jenkins's 'Théâtre Contemporain.'

'The Hygeian Home Cook Book,' by R. T. Trall, M.D., and 'Health in the Household,' by Susanna W. Dodds, M.D. (Fowler & Wells), will interest not alone those who subscribe to the special theories propounded in them. The sound of body as well as the invalid ought to know how many palatable dishes can be provided without meat, sugar, spices, or salt, and without the accompaniment of either tea or coffee. Marion Harland does not expect her little book, 'Cookery for Beginners' (Boston: D. Lothrop & Co.), to do away with personal instruction. Indeed, she frequently counsels seeking help from "an experienced friend." Her advice is good for much beyond meats and breads. What dreadful things the world would have been spared in ceramics and crewels if young-ladyhood generally had understood her maxim, "Never undertake cake unless you are willing to give to the business the amount of time and labor needed to make it *well*." 'Household Conveniences' (Orange Judd Company) contains a great number of devices for simplifying the work of a family, or for making the home more comfortable and more attractive. The book is sure to be useful, and it will be most welcome where there is more time and more power of contrivance than money.

The seventh volume of the revised edition of Mr. Gardiner's history has just been received, its issue having been somewhat delayed. It embraces the important period from the Petition of Rights to the first issue of writs for Ship-money (1629–1635); that is, the period during which the King's scheme of personal government was set on foot. The hero of these years is Eliot, for the closing of his Parliamentary career, his imprisonment, and his death are here narrated. Laud, too, now looms into prominence, and becomes the most active agent of the King's policy. Wentworth, however, is still in the background; for he, "though long admitted into the King's service," we read (p. 134), "had only recently acquired even a very slight hold upon the King's favor." The contemporary events in Germany and in America receive a due share of attention, and their relation to English affairs is made clear.

Mr. W. M. Griswold's monthly *Monograph* (New York: J. W. Christopher), having reached and passed its fiftieth number, has just been indexed for Nos. 1–50. Biography enters largely into this useful popular series.

Mr. Edward Roth, No. 1135 Pine Street, Philadelphia, sends us Part 4 of Volume I., of his la-

borious and generous Index to Littell's *Living Age*. The department is still Biography, and now extends as far as Marie-Thérèse.

Mr. Furnivall and his new Shakspere Society have shown what personal controversies can grow out of a peaceful literary pursuit. The same study in this country has not been without its occasional acerbities, but the recent outbreak of long-smothered hostility between two neighboring commentators in Cambridgeport, Mass., has happily few paralliels, if any. The Rev. H. N. Hudson and Mr. W. J. Rolfe have, in their rival editions, for some time paid each other critical attentions which the elder and reverend Shakspere scholar could at last endure no longer. He charges Mr. Rolfe with forever naming him in his notes only to belabor him; while Mr. Rolfe complains that Mr. Hudson has girded at him the more insultingly because by anonymous reference, as, "Some one has noted," "Whoever talks in this way," etc. Mr. Hudson is further wroth with Mr. Rolfe for undertaking an expurgated Shakspere, and for pretending to be critical while making slips himself. A pamphlet from the former and a rejoinder from the latter in the *Literary World* of March 22, are the latest exhibitions of this broil, in which the pamphleteer has hard work to restrain an unbecoming temper.

The proceedings at the fiftieth anniversary of the organization of the American Anti-Slavery Society, in Philadelphia, on December 4, 1883, have been printed in a modest pamphlet, without indication of the publisher or price.

The National Education Association will meet at Madison, Wisconsin, in the State Capitol, on July 15-18, 1884. National Illiteracy is the first subject set down for discussion.

It is seldom that we receive from the South notices of the formation of library associations, and we therefore stop to acknowledge the Preamble and Constitution of the Enfield (N. C.) Library Association, of which Mr. L. E. Whitaker is Secretary. Donations of books, magazines, or papers would, we understand, be very acceptable to this praiseworthy organization.

In a season of earthquakes, eruptions, cyclones, and other physical eccentricities, it seems less odd to read "Vol. 2, No. 1" on the title-page of the *International Standard*, "a magazine devoted to the preservation and perfection of the Anglo-Saxon Weights and Measures, and the discussion and dissemination of the wisdom contained in the Great Pyramid" (Boston and Cleveland). Meantime, Dr. Barnard continues his fatal examination of Professor Piazzi Smyth's lunacy on this subject in the March number of the *School of Mines Quarterly*.

Prof. M. W. Harrington, director of the Observatory of Michigan University at Ann Arbor, proposes to publish a monthly *American Meteorological Journal* of from 24 to 32 pages, octavo, according to the support given to it. A painful interest just now attaches to the subject, and the number of students and observers (of the winds particularly) cannot be too many. Professor Harrington is competent to give his magazine a high scientific tone and value. Its publishers will be W. H. Burr & Co., 100 Griswold Street, Detroit.

The *Art Amateur* has an article, with many charming decorative designs, on an artist with a new name, M. Habert-Dys; some notes and illustrations of the Castellani sale at Rome, now going on; and some sensible remarks, full of information, as to spurious furniture—a subject of some importance to New Yorkers, as much of this ware comes here. Two remarkable *cassetoni*, or painted bridal caskets, made by a well-known living workman at Perugia, were lately sold in New York as genuine antique furniture, and created great enthusiasm.

The *Portfolio* has a full-page etching of "A Foot-Bridge over the Wily"—a characteristic English landscape, not above mediocrity as etching or subject—and some more of Mr. Pennell's picturesque bits of Venice, of which "The Three Bridges" is unusually good. Of the photo-etching of Tinworth's "Crucifixion," we can only say that with an excellent reproduction we find nothing to justify the celebrity to which this artist in terracotta has attained. Sculpture is an art in which mere facility in designing of groups in relief can hardly justify the reputation accorded to Tinworth without a much greater refinement and dramatic power than he has shown. Work in relief or the round is so easily appreciated in its most elementary conditions that the entire public puts itself on the jury for judging it, and this jury has placed Tinworth. The relief has some excellent commonplace incidents, but the central figure, the Christ, has too much of the caricature in it to save the dignity of the *ensemble*. An excellent article by Walter Armstrong, "On the Authorship of Some Italian Pictures," opens a series, and George Radford discourses in the timid way English art writers (except Mr. Hamerton) generally have when they dare to question Mr. Ruskin's views, on the scene of some of Turner's work, Wharfedale.

A crayon portrait of Alphonse Karr, anno 1838, by Célestin Nanteuil, will be found in the March number of *Le Livre*, and we do not know that there is anything else which calls for special notice.

From correspondence published in the Boston *Advertiser* it appears that the Boston Society of Architects has contributed $500 toward defraying the cost of publishing the results of the Assos expedition, and engages to pay a further sum of $500, if necessary, to the Archæological Institute of America. President Norton announces that the report will be at least a year in forthcoming.

In last week's *Science* appeared a very lucid account of the whereabouts and prospects of the Greely expedition, combined with some criticism of the search programme, and accompanied by a large map of the Arctic region under discussion. It will be valuable for reference hereafter.

— We deeply regret to record the death, on March 31, of Mr. Frederick Leypoldt, the well-known editor of the *Publishers' Weekly*, in the forty-ninth year of his age. He was a native of Stuttgart, but came to this country before attaining his majority, and at once entered the book business, passing from a subordinate employment in New York to an independent circulating library and importing and publishing house in Philadelphia, which he transferred to this city in 1865, and in January, 1866, associated with himself Mr. Henry Holt. Out of their *American and European Literary Bulletin* grew the *Publishers' Weekly*, to which, after March, 1871, when Mr. Leypoldt finally withdrew from publishing, he devoted himself, making it the principal organ of the book trade of this country, the fountain of accurate trade bibliography, and the most useful publication (literary criticism apart) for author, publisher, and book-buyer ever established on this side of the water. To Mr. Leypoldt's fertility of invention, ardent persistency, and unmercenary self-sacrifice, we owe among other periodicals the *Literary News*, the *Library Journal*, the *Index Medicus*, various guides to books and to reading, the 'Publishers' Trade List Annual' (a congeries of publishers' catalogues, with educational and other bibliographical lists for the year, compiled from those given monthly in the *Publishers' Weekly*), and the monumental 'American Catalogue' of all works in print in this country down to July 1, 1876. This enumeration gives but a faint idea of Mr. Leypoldt's incessant activity, even when we remember the part played by his able co-laborers. Some memorial of this excellent man might well be expected from authors, in acknowledgment of his intelligent efforts on behalf of international copyright; and from publishers, for his happy influence in promoting harmony and raising the tone of the trade.

—Mr. Oliver T. Morton has an article in the April *Atlantic* on "Presidential Nominations." He objects, to the present system of nominating conventions, that it produces, not real leaders, but accidental candidates. He proposes to make the convention a more popular body than it now is by the following device: First, the candidates for President and Vice-President are to be balloted for by Congressional district conventions, on the "proportional" plan, one delegate representing every fifty votes cast at the last Presidential election. Second, all the district conventions are to meet on the same day, and cast one ballot for President and one for Vice-President. Third, a national convention is to be held two weeks later, and to this body each district convention is to send one delegate for every hundred delegates of which it is composed. Fourth, in "this national body the party platform shall be adopted, and all the votes given for all the candidates in the Congressional district conventions shall be counted. If any one candidate shall have received a majority of all votes cast, he shall be declared the nominee of the party; but if no one candidate shall have received a majority of such votes, the national convention shall proceed to choose a candidate from the five names which have received the five highest number of votes. In case of a tie, a sixth candidate shall not be excluded. The method of procedure shall be the same for Vice-President." This plan would give a national convention of between 900 and 1,000 delegates instead of 820 as at present, and they would, in theory at least, reflect the drift of opinion in the party better than a body of delegates elected in the present way. But the convention would, if increased in numbers, be a still more unwieldy body than at present, and more subject to waves of excitement and enthusiastic diversions of sentiment in favor of "dark horses"; for the probability of any one candidate receiving a majority of all votes cast in the local conventions seems small.

—An illustrated article on "Workingmen's Homes," in *Harper's* for April, by R. R. Bowker, gives an interesting account of Miss Octavia Hill's work in redeeming some of the London poor from misery and filth. The story is one of the most encouraging and hopeful episodes in the history of modern philanthropy. It is well known that dwellings for workingmen can be provided so as to give them a clean, comfortable home at a very moderate price, and yet return a fair income on the capital invested. But the process of providing these does little or nothing to improve the condition of the inhabitants of the rookeries which make up so large a part of the slums of a great city. If one of these is pulled down and an improved tenement-house put up on its site, the old tenants do not go into the new building at all, but wander off to other filthy and degraded places of abode. What Miss Hill undertook was to elevate and improve this wretched class in the very rookeries in which they dwelt—to force them to become clean, orderly, and thrifty. She accordingly took three of the worst courts in London, the inhabitants of which were only one remove above vagrants and paupers. The houses were vile; the stairways caked with inches of

dirt; the dust-bins crammed with rotting refuse of food, which also was spilled over the passages; water dripped through the roofs, and drove in through the windows; the plaster and woodwork were broken; and, finally, the place from cellar to roof was alive with wretched, filthy human beings. On this unpromising material Miss Hill went to work, and she went to work on principles the exact opposite of those which fashionable charity generally inculcates. The first thing she did was to collect the rent. The rent of places of this sort is always in arrears, and is collected with great difficulty. But Miss Hill first constituted herself the landlord of these unfortunate people by the purchase of the houses, and then went to work to purify and improve the place through the purification and improvement of the lives of the inhabitants. Those who paid their rent regularly were treated with kindness, and given work to do in the care of the buildings, etc.; those who earned no money, and were eating the bread of idleness, she turned into the street. To make a long story short, the experiment paid for itself, and Miss Hill was enabled to pull down the old rookeries and put up the new St. Christopher's building instead, which now "profitably houses as many happy people who pay no more than in the old slums." The great question which is suggested by a story like this is: Can this system be taught? The enthusiasm of humanity, of philanthropy, or charity, or whatever we choose to call it, produces only a certain number of Octavia Hills, exactly as religion can produce only a certain number of Luthers or Savonarolas; but if philanthropy is to accomplish much in the permanent amelioration of human misery and want, it ought to be able to produce workers and missionaries in this field, exactly as it does in others. Anybody could be taught to do work like Miss Hill's, given only a sufficient amount of intelligence and disinterestedness to start with, and she seems to have been able to use very inferior persons to help her. At any rate, such cases ought to do something to show how wicked it is for the rich to waste money on the lowest class of the poor, as they so often do, without exacting in return for it some effort for self-improvement.

—The *Century* for April contains, in its "Topics of the Time," a thoughtful and seasonable article on the future of the Metropolitan Museum. It takes the ground that the business of an art museum is to provide art education—which seems like forcing an open door. In any business association, the *Century* argues, the first object is to secure the superintendents "who know best, and in a strictly professional and practical way, what the museum should be, what the objects to be accomplished are, what classes of exhibits are of the first importance, how they can be procured, what they should cost, and especially what relative importance should be given to the departments of which a museum must be made up. In a word, every man of business is aware that the first essential in any enterprise is a person who actually knows how to do the thing, and that for practical purposes amateur knowledge is worse than no knowledge." One of the commonest delusions on the subject of art is that *de gustibus non est disputandum;* or, rather, the delusion is in mistaking ignorant preferences for *tastes.* There must be education to form taste; and if educated and well-formed tastes differ, there can be no disputation as to their respective merits, but they can be weighed and estimated by a more educated taste alone. If the dictum has any meaning at all, it is that questions of taste cannot be settled by argument; and to interpret it as holding that there is no higher law of taste to which individual preferences may be referred for judgment, is to suppose what the experience of every day of our lives proves untenable. And in art, as the last study to which the progress of civilization leads us, the power of judgment arrives latest. To quote again the *Century:*

"There is no greater or more common fallacy than the idea that this knowledge is of easy attainment. Every one who goes to an art gallery feels the right to pronounce as to the value of the works before him, when, in fact, in nine cases out of ten, his judgment shows nothing at all except his own stage of culture. . . . In fact, the commonest error among the uneducated in art is that the difference in pictures is in the degree of skill with which nature is photographed; while the real value, the new aspect of the world, or of nature, or of thought which they unfold, is unsuspected and invisible to the untaught eye."

The obvious drift of the article is to recommend the putting a competent person in charge of the museum, and the classification and intelligent arrangement of the objects in it. Moreover, "if, in this sifting process, however, a part of the collection should be either set aside as *artistically* so much encumbrance," or sold to or exchanged with other museums, we should not be surprised." As the Metropolitan Museum is practically a private institution, the article of the *Century* may be recommended especially to the owners; but unless they choose to interest themselves in the question of education in art, there is no means of compelling them to do what common-sense as well as the *Century* recommends.

— A glance is all we can give to a number of medical and physiological works which have accumulated on our table. 'The Relations of Micro-Organisms to Disease' (Chicago: W.T. Keener) is a reprint of Dr. Belfield's Cartwright lectures, delivered a year ago to physicians in this city. It clearly explains what is known and thought in the best medical circles about bacteria. Dr. Gradle's 'Bacteria and the Germ Theory of Disease' (same publisher) covers similar ground, but is not as attractive reading. Tracy's 'Hand-Book of Sanitary Information' and Teale's 'Dangers to Health,' both published by the Appletons, and the latter an illustrated work with a maximum of pictures and a minimum of text, are unrivalled as intelligible and trustworthy guides on sanitary affairs of daily interest. 'Health at Home' (Appletons), good in tendency, is commonplace, and is unnecessary for those whose sanitary knowledge goes beyond primers. 'The Air we Breathe and Ventilation' (John Wiley's Sons) leaves the impression that the commercial bearing of ventilating apparatus, several types of which are described, is as well studied in it as are their scientific features. Mr. Gerhard's 'Drainage and Sewerage of Dwellings' (W. T. Comstock) goes over the ground indicated by the title with what seem needless detail and repetition for ordinary readers. It will attract chiefly architects and building inspectors. Dr. Weir Mitchell's 'Fat and Blood,' in its third and revised edition (Lippincott), while written for physicians, may be read with advantage by all intelligent persons who are interested in serious invalids of the so-called nervous class. 'The Home Physician' (Putnams) would condense the medical sciences into an hour's reading, for the benefit of those who can reach no doctor. It is better to trust in Providence than to increase that class who have fools for patients. With simple but attractive language, Mr. William Blaikie has set forth, in a series of illustrated lessons, an excellent system for symmetrical physical development under the title of 'Sound Bodies for Our Boys and Girls' (Harpers). Followed out, as it easily may be without trouble and at no expense, it will be worth more than a thousand homilies in the preservation of physical and moral rectitude. In 'Cremation' (Lippincott) Mr. R. E. Williams cursorily describes burial customs, and then, as against inhumation, makes an excellent argument for the disposal of the dead, by incineration, on æsthetic, economical, and sanitary grounds.

—The complete, revised, and enlarged edition of Herder, noticed in the *Nation* (vol. xxvi., p. 360), is still appearing. Bernhard Suphan is devoting to it the most laborious and painstaking scholarship, and in every volume bringing out from Herder's manuscripts new and interesting matter. The edition will be, for many reasons, such a monument to editorship as hardly any other modern author has made possible. In one of the late volumes (vol. xviii.) is published the first form of Herder's translation and discussion of the rules composed by Franklin, in 1728, for the conduct of the meetings of the Junto. These rules or questions—"Fragen," as Herder calls them (they are put by Franklin as questions to be addressed to the members at the meetings)—appear also with comments in the third section of the first collection of the 'Letters for the Advancement of Humanity.' Franklin's name is the one, the primary example, with which these letters, the first collection of which was published at Riga in 1793, open. Other great men whose ideas are discussed in the series are Frederick the Great, Luther, Leibnitz, and Lessing. Much interest for Americans attaches to the discussion as previously published, especially from the prominence of the treatment of Franklin; but the older form now first made public, not merely in vol. xviii., but also published separately (Berlin: Weidmannsche Buchhandlung), and dedicated by Suphan, with a prefatory address, to a distinguished friend, is even more interesting. The manuscript is in Caroline's handwriting. As Herder enjoyed the manual labor of writing, and, though receiving in his authorship help of various sorts from his wife, did not, except for private letters, employ her as an amanuensis, this paper was probably dictated at Aix-la-Chapelle, where he went with Caroline in the summer of 1792, to get the benefit of the baths, and where he was precluded by his condition from writing himself.

—The discussion is in the form of an address. For what was it intended? Hayne has suggested, and another critic has more strongly asserted, that it was intended for a meeting of the "Freitagsgesellschaft," a club founded at Weimar in July, 1791, of which Goethe, Wieland, Herder, Knebel, Bertuch, and other literary men were members. This club met at first once a month, but there is a letter from Goethe to Wilhelm von Humboldt, written in December, 1795, in which it is spoken of as convening every week. There is, to be sure, no evidence, as there is in regard to two other of Herder's papers, that the address was read to the club. This translation makes it plain that Herder had a good deal of interest in American affairs, and contrasted, not always with satisfaction, limitations in Europe with the plastic conditions here. Naturally enough, with all these years of labor on Herder, Suphan becomes more and more fascinated by his great subject and all that pertains to it. His delight in the contemplation of Herder and Franklin as having mental affinities (*Gesinnungsgenossen*) is not without reason, and even his belief that the two men had resembling features has some foundation. The likeness is largely in the forehead and upper part of the head, but is probably more marked in the engravings than it would have been in life. Franklin's eyes, even in the engraving from the

Duplessis portrait, seem more practical, quicker, and shrewder. Franklin was the embodiment of that popular force which Herder always believed in. Herder's remarks on Franklin are as discerning as Laboulaye's, and in some sentences quite similar. The achievements of Franklin seem much greater than those of Herder; but the latter (to use the words of evolution) was a sort of "cosmic nebula," and though his personality and work fail to make the distinct impression belonging to a more defined and special career, they are yet full of the "potency" of much that is now influential and commanding. This brochure of Suphan's enforces anew this old claim of Herder's admirers.

THOMAS HUTCHINSON.

The Diary and Letters of Thomas Hutchinson. Compiled by Peter Orlando Hutchinson. Boston: Houghton, Mifflin & Co. 1884. Pp. 594.

We have taken the liberty to abbreviate the portentous title-page of this book, which, though it bears an American imprint, is really printed and probably published in London. It is adorned with photographic portraits of Governor Hutchinson and his brother-in-law, Andrew Oliver, and a reproduction of a page of his manuscript. It is neatly printed, and at the first glance promises more in the way of instruction or amusement than it fulfils. The disappointment is not so much the fault of the author as of the editor, whose preliminary flourishes and parade of style lead the reader to turn over page after page to discover the wonderful state secrets which are to be revealed. What may lie perdu in the remainder of the manuscripts is known only to that editor, and we may therefore yet be put to shame for our expression of incredulity; but, chancing that, we will frankly say that a volume of half the size would have been more welcome and far less tedious. Few Americans of the Revolutionary period have had a more lasting renown than Thomas Hutchinson, and few have been more leniently judged on a second hearing. Abused for his virtues, condemned in his absence, feared, hated, and maligned to a degree which now seems absurd, the lapse of a century has left his fellow Bostonians ready to see and acknowledge the really attractive side of his character. The publication of these extracts from his papers will add little to the history of events, but it will greatly contribute to the reëstablishment of the writer.

Governor Hutchinson, as is well known, was born in 1711, and was descended from William Hutchinson, an early settler in Boston, whose wife, Anne, filled a larger place in our annals than he did. The family prospered here, and by the third generation was clearly established in the ranks of the local gentry. Thomas Hutchinson, the father of the Governor, died in 1739, a member of the Council, leaving an estate far beyond that of most of his contemporaries, the fruit of a widely extended commerce. His son was sent to Harvard at the age of twelve, and was duly graduated, though, as he writes, he "after four years was little better qualified for the degree of Batchelor of Arts, which he received in 1727, than when he first entered." After this "he went into his father's countinghouse and became a merchant apprentice from seventeen years to twenty-one." In 1734 he was married to Margaret Sanford, a young lady who had not completed her seventeenth year. In 1737 he was chosen selectman and representative. By setting himself against the popular craze for paper money, he lost a reëlection, but soon regained his place and served in 1740. In 1741 he visited England, and on his return again represented Boston from 1742 to 1749, being Speaker for three years. In 1749 he was chosen to the Council, in 1752 he succeeded his uncle as Judge of Probate for Suffolk, and in 1758 he was made Lieutenant-Governor under Pownall. In 1760 he was also created Chief Justice of the Supreme Court, of which he writes (p. 66): "This employment engaged his attention, and he applied his intervals to reading the law; and though it was an eyesore to some of the Bar to have a person at the head of the law who had not been bred to it, he had reason to think the lawyers in general at no time desired his removal." On this point he cites also (p. 195) a conversation with Governor Bernard in England in 1774: "Sir Francis mentioned among other things that he apologized to Lord Mansfield for appointing me Chief Justice, not having been bred to the law; adding that he had no cause to repent it. Lord Chief Justice Wilmot being by, broke out with an oath, 'By ——, he did not make a worse Chief Justice for that!'"

When Governor Bernard went home in August, 1769, Hutchinson became acting Governor, and in March, 1771, he received his full commission. In 1774, he solicited and obtained a leave of absence to visit England, but as the Lieutenant Governor, Andrew Oliver, had recently died, the King appointed General Gage to be Governor "during his Majesty's pleasure." It seems to be indisputable that Hutchinson was not superseded nor dismissed, but that it was fully expected that he would return and resume his office. He was accompanied by his son, Elisha, and his daughter, Margaret, and, after a voyage of thirty days, reached London on June 30. The main portion of this book is given to Hutchinson's diary and letters after his arrival in England. The reader may therefore dismiss all hopes of any new revelation in regard to the events which preceded the Revolution. Hutchinson, a voluminous writer, and a zealous collector, experienced the unkindest blows of fate. In 1765 a rascally mob in Boston sacked his house and threw his papers into the street, only a portion being recovered. When he started for England, he had left behind at Milton all his books and papers, and in April, 1775, these fell into the possession of the American troops. Hence his descendants will not be able to produce any inedited documents of an earlier date, unless in the form of memoranda of his own recollections. The documents still extant in England are described as seven volumes of Diary and three Letter Books, with a Diary of his son-in-law, Peter Oliver, jr., some almanacs and other miscellaneous books. The present instalment comprises the Diary from June, 1774, to the close of 1775, being the first and smaller three books. There are left in manuscript four books reaching to May, 1780.

The merits of the collection are greatly lessened by the senile affectations of the editor, whose rambling and often impertinent notes are so intermixed with the text, in a type scarcely distinguishable from it, as continually to prevent a proper understanding of the subject. Even when necessary documents, copies of letters and the like, are given, they are thrust into the page instead of appearing as foot-notes. But, so far as can be clearly seen, it appears that in the first 150 pages will be found a manly and interesting autobiography of Hutchinson, prepared, indeed, in England, but covering his life up to the time of his departure from his native land. This document is well worth preservation, and, if printed continuously, would add to the author's reputation. The next important piece is a careful record of an interview which he had with King George, the day after his arrival in London. This paper, however, has already been printed in the Proceedings of the Massachusetts Historical Society for October, 1877 (pp. 326-334), and is therefore familiar to students.

The diary for the next eighteen months gives us a very complete view of Hutchinson's life in England, but it presents few quotable passages. It is an admirable means of studying the man, but in truth he soon ceased to be an important factor in the affairs of state, and his revelations are few and unimportant. We can, however, reconstruct for ourselves the picture of this staid provincial gentleman of sixty-three, thoroughly imbued with Puritanic feeling, albeit a loyalist so unflinching as to be ready to sacrifice fortune and home to his principles. He lands, perhaps with a little pleasant flutter of anticipation that his cause is that of a King who will appreciate the sufferings he has borne. He is courteously received by that King; he is offered a baronetcy; he accepts such a continuance of his salary as enables him to maintain a modest hospitality. He meets the influential Ministers of the Crown; he is welcomed to the tables of the highest nobility; he is consulted, in a measure, about American affairs. As soon as the novelty of his position has worn off he begins to work, and, however strangely it may disappoint our preconceived ideas, he works conscientiously, for a people who have nothing but execrations for him. He is strong in the belief that the colonies must succumb if an appeal be made to arms, and yet he counsels conciliation and forbearance to those who have the control of England's armies. His constant platform is that the right of Parliament to rule America is incontestable, and his only hope is to bring back the people to an acknowledgment of that cardinal truth, never questioned, as he says, until within a dozen years.

In August, 1774, Hutchinson records a long conversation with Lord Mansfield, who "allowed the Lords of Council had their pens prepared to sign a warrant for apprehending persons in Boston, but did not allow they desisted because another measure was thought more expedient, but because the Attorney and Sollicitor-General were in doubt whether the evidence was sufficient to convict them; but he said things would never be right until some of them were brought over." In the same month he writes concerning Boston: "Providence, I hope, will avert its total ruin, and I should have thought it the happiest event of my life if I might have been the instrument." During the remainder of the year there seems to have been little appreciation of the importance of the crisis by the highest officials of the Government. Lord North is frequently cited; but, though he seems to be fully convinced that the holding a Congress is an act of treason, he is ready to consider a plan which would turn the colonies into a confederacy. He is even ready to give an interview to Josiah Quincy, though Hutchinson, when his opinion was asked, gave this character to the patriot: "I informed him [North] he [Quincy] was a lawyer, as inflamatory in Town Meetings, etc., as almost any of the party; that I fancied his errand here was to inflame the people by his newspaper pieces and in every other way possible, and to give information to those at Boston of the same spirit and party, what was doing here, and whether they were in danger." On December 29, 1774, Hutchinson notes: "Even the political Barometer, the Stocks, neither rise nor fall." "Whether it be owing to the nature of the English Constitution, or some other cause, there is a strange inaction, considering the critical state of affairs." So, again, under date of May 6, 1775: "Dined with Mr. Gibbon, etc. . . . It seemed generally agreed that the American affairs made not the least disturbance in any part of the Kingdom."

On the 29th of May, 1775, news was received of the battle of Lexington, by a vessel sent expressly by the Provincial Congress. "Lord

Dartmouth was much struck by it." "He read me a card from Lord North, which says the beginning of action in America was rather inauspicious, but hopes the account in the *Mass. Gazette* was exaggerated. There appeared a degree of that apathy which I think Lord N. has a great deal of." "I called upon General Harvey, where I found Grant and Dalrymple. Harvey swore and reproached them—chiefly Dalrymple, because he wanted more forces—with this expression: 'How often have I heard you American Colonels boast that with four battalions you would march through America; and now you think Gage, with 3,000 men and 40 pieces of cannon, mayn't venture out of Boston!'" It was not until June 10 that Government received its despatches, and these confirmed the first reports. On the 12th, Hutchinson waited upon Lord Dartmouth, who "was for putting the most favorable construction upon it. I mentioned a Proclamation, with a general pardon to all who should return to their allegiance. Lord D said he was for having it done long ago, but thought there should be some exceptions. Lord North has not been in town since the news."

On the 25th of July news of the battle of Bunker Hill arrived, but it is noticeable that from this time on Hutchinson seems to have little intercourse with the Ministers. His diary, indeed, records the rumors of the day, and his letters show his estimate of the position; but he has become absorbed in the current of English life, and America recedes from his view. The probable evacuation of Boston is evident, and his letters to his family contain his directions for the safety of their persons and effects. Leaving this part of the record, we may point out a few allusions to other and less engrossing matters. Hutchinson was naturally interested in the controversy as to the mode in which were obtained the letters sent by him to Thomas Whately, which had been published in Boston. It was well known that Franklin was the intermediary, but the link from Whately was missing. Rumor had charged John Temple with abstracting the letters, and the adoption of this report by John Whately, the brother and executor of Thomas, had led to a harmless duel between him and Temple. Hutchinson seems at first to have believed in the truth of the story, but finally to have credited Temple's innocence and to have become quite friendly to him. Historians now seem to agree that the letters were given by Thomas Whately to the Hon. George Grenville, at whose death they fell into the hands of Earl Temple, who gave them to the Hon. Mr. Fitzherbert, and he in turn to Dr. Franklin.

Hutchinson once refers to his former visit to England (on p. 376) as follows: "We dined in the city with Charlton Palmer. His sister, who I remember a gay girl in 1741, is now a cheerful, chatty old maid." On p. 529 there is an interesting story about Boston:

"Colonel James tells an odd story of the intention of the officers the 5 March, that 300 were in the Meeting to hear Dr. Warren's Oration: that if he had said anything against the King, etc., an officer was prepared, who stood near, with an egg to have thrown in his face, and that was to have been a signal to draw swords, and they would have massacred Hancock, Adams, and hundreds more; and he added he wished they had. I am glad they did not: for I think it would have been an everlasting disgrace to attack a body of people without arms to defend themselves."

"He says one officer cried 'Fy! fy!' and Adams immediately asked who dared say so? And then said to the officer he should mark him. The officer answered, 'And I will mark you. I live at such a place, and shall be ready to meet you.' Adams said he would go to his General. The officer said his General had nothing to do with it, the affair was between them two, etc."

Again (pp. 441–444) there is a very interesting memorial concerning Fort Hill, Boston. Though not giving many new facts, it is a clear statement of the history of that lot of land, showing that it was part of the original property of the town, reserved for the site of a fort.

On p 349 is mention of a trip to Bath and thence to Warmister:

"I found here a gentleman by the name of Middlecot, whose grandfather went over to England near eighty years ago to take possession of an estate which the grandson now lives upon. It's a good house he lives in, with elegant garden: small. The grandfather was uncle to Middlecot Cooke, and Mrs. Bouchier was his sister, to whom I was a pall-holder about ten years ago or more in Boston. I remember my father's telling me of his being at this house, and Mrs. Alden, who went to England with a sister of Governor Belcher, lived here for some time, and also Dr. Cooke and son, etc."

Hutchinson here confirms the truth of the Payne MS., edited by Mr. Whitmore for the Massachusetts Historical Society in 1875. That document states that Tobias Payne married Sarah, daughter of John Winslow and widow of Capt. Miles Standish. She married thirdly Richard Middlecott, and had three daughters and one son by him. The son, Edward, went to England, where he bought his father's life interest in an entailed estate at Warmister of £300 per annum, and had an only child Edward. This last was evidently the father of the gentleman whom Hutchinson met.

At Aylesbury Hutchinson writes (p. 249): "I could not help being sensibly affected at seeing the boys of the Free School with their master in a particular part of the church, as it brought to my mind that Colo Foster, my mother's father, was of Aylesbury, and I suppose of the same school (he being a very good grammar scholar), and I doubt not a little more than an hundred years since sat in the same place." On p. 196:

"Dined with my two sons at Lord Chancellor's. Talking of longævity, Lord Chancellor said that his father's (Lord Bathurst's) grandfather was born in the reign of Henry the Eighth, which must be about two hundred and thirty years ago; and a house which he built in Queen Elizabeth's reign is now standing. Lord Bathurst is living in enjoyment of health of body and mind, above ninety. This is more extraordinary than the instance of Gov. Dudley of N. Eng., who was a Capt. of horse under H. the 4 of France in the 16th century, and two of his granddaughters are now living."

Speaking (p. 145) of events at Boston at the close of 1773, and the grant of a salary from the Crown to the judges, he writes: "There was a gallery at a corner of the Assembly Room, where Otis, Adams, Hawley, and the rest of the Cabal used to crowd their Mohawks and Hawcubites, to echo the oppositional vociferations to the rabble without doors." This is evidence on a point which a visitor to the Old State House in Boston might hardly believe, looking at the scanty height of the Representatives' Hall.

Of his own feelings, a few indications are given. October 26, 1774, he writes: "Taking up a volume of the Biographical Dictionary, this passage in the life of Mr. Maclaurin came home to me: 'Here I live as happily as a man can do who is ignorant of the state of his family and who sees the ruin of his country.'" On the blank leaves of the third volume of his diary he quotes, "*Gubernatorum vituperatio populo placet*" (p. 401). When he learned that his letter-books at Milton had been found and used by the colonists, he wrote to Sewall (p. 500):

"At any other time, the ravages made upon my house, and the seizure of my private as well as publick letters and other papers, would have been very sensibly felt: but the publick calamities lay so heavy upon my spirits before, that this present misfortune made no addition worth mentioning. I cannot recollect a correspondence of seven years. I am sure I never wrote anything I did not believe to be true. I am sure I never wrote anything which I thought would hurt the real interest of my country or be injurious to individuals."

Later on he writes (p. 557): "My family is well. My property which was at Milton sold at *vendue*. Washington, it is said, rides in my coach at Cambridge. The farm, people were doubtful about purchasing, and therefore it is leased out." Certainly Hutchinson must have been very patient or very reticent, since even in his writings no word of anger for his losses can be found. It may be here remarked that he seems to have been singularly self-contained and unimpassioned. On p. 574 he records of Garrick as *Archer*, in the "Beaux' Stratagem," "Either he is too old for such a character, or I am too old to see the excellencies which draw such crowds after him." On p. 243 we find an opinion recorded in 1767, as follows: "Pleasure should always give way to business, and the picture of a horse race is every whit as agreeable as the original." On p. 475 it is recorded: "To avoid being singular, I went in the afternoon at 6 to see the Regatta, from Lord Loudon's, Privy Gardens; tarried till 8, and had patience no longer."

With these citations we may take our leave of the Governor, though there are many lesser touches which bring into view the same curious character. One can almost affirm that he was a loyalist by stress of reason rather than by conviction or sympathy. His soul yearned for his native land, his best wishes were for his countrymen, he felt himself an alien in the England which swallowed him. But the conviction of the absolute correctness of his position in regard to the logical supremacy of Parliament paralyzed every movement of his heart or of his intellect. We cannot dismiss the book, however, without reverting to the eccentricities of the editor. He is too indifferent to seek to learn the distinction between Samuel Quincy and Josiah Quincy, between Joseph Green and Gardiner Greene, between Colonel Watson and Richard Clarke, as his bewildering notes show. But he takes every opportunity to show his spite against the colonists and their descendants, and to air a Toryism which must be exceptionally absurd even in England. He is especially spiteful and ridiculous in his references to the copy of the record of the interview between the King and Governor Hutchinson, which was obtained by Mr. Everett thirty-five years ago. It was an exact copy, conceded doubtless as an act of courtesy to our representative at the Court of St. James

Mr. P. O. Hutchinson gives a woodcut of his family arms. It is an indisputable but mortifying fact that these arms do not belong to the Governor's family. His emigrant ancestor, William Hutchinson, was born at Alford, and was son of John H., who was the youngest son of John Hutchinson, Mayor of Lincoln. Here the pedigree stops absolutely. There were four brothers in that generation, Rev. Christopher, Thomas, William (also Mayor of Lincoln), and John. Their parentage is unknown, and the late Colonel Chester, who made extended search into all the families of the name, wrote that in 1634 the grandson of William (the above-named Mayor), claimed the arms of the Hutchinsons of Yorkshire. On his paper are endorsed the words, "Respited for proof." "The requisite proof was evidently never furnished, nor have the arms ever since been granted or confirmed to any member of the family in this line. . . . The fact that it could not then be accomplished and has not since been done, is fatal to the claims of the descendants of the two Mayors of Lincoln, including Governor Hutchinson himself."

LEONARDO DA VINCI.—II.

The Literary Works of Leonardo da Vinci. Compiled and Edited from the Original Manuscripts by Jean Paul Richter, Ph.Dr., &c. 2 vols. London: Sampson Low, Marston & Co.

To leave the painter and turn to the sculptor, architect, thinker, philosopher, and physicist, is to close the first and open the second of these volumes. It is impossible in our space even to indicate the variety of themes on which Leonardo throws out his suggestions, schemes, and observations—sometimes *disjecta membra*, as if he had been in a disputation, and, ruminating thereafter, shot back some shaft of thought. He gives directions for founding, for all kinds of engineer work and constructions, and those who will profit by them may follow him closely. In physics there are inevitably many vain speculations, in accordance with the tendencies of the time. The nature of the soul, its origin, etc., call out reflections subtle, indeed, but necessarily as futile as some to-day. At the end of his hints on medicine, he says:

"If you wish to keep well, keep to this rule—Eat not without desire (*appetito*); chew well; and, so far as nothing prevents (*e per quel che niente ritiene*), let it be well cooked and in a simple manner. Who takes medicine is ill-advised (*mal s'informa*). I teach you to preserve health; in which thing you will succeed better in proportion as you abstain from medicines, because their composition pertains to alchemy."

A prayer is: "Thou, O God! sellest us all goods at the price of labor." Another: "Oh, admirable justice of thine, Prime Mover! thou hast not wished that there should lack to any force the order and quality of its inevitable results (*necessari effetti*)." A bit of satire on Petrarch runs: "If Petrarch loved so much the laurel, it was because it goes well with sausages and tunny. I cannot put any value on their nonsense." Here is a bit of philosophy, on dogs, which may be humorous:

"This animal hates the poor because they eat poor food, and loves the rich because they eat good food, and especially flesh. . . . Now, dogs have so subtle sense of smell . . . that if they know the dog by means of this smell to be well fed they respect him, because they judge that he has a rich and powerful master; and if they do not smell such odor with its virtue, they judge the dog to be of little account, and to have a poor and melancholy master, and therefore they bite him as they would have done his master."

The claim of the discovery of the circulation of the blood, made for Leonardo, is not better sustained than that made for Swedenborg: he was evidently very near the truth, but does not declare the secret of the motion of the blood.

"Death in old men," he says, "when not from fever, is caused by the veins which go from the spleen to the valve of the liver, and which increase so much in tissue that they close and no longer give passage to the blood that nourishes them. The continual current which the blood makes in the veins is the cause that such veins swell, and get indurated, and forbid the passage of the blood. . . . The waters return with constant motion from the lowest depths of the sea to the highest summits of the mountains, not following the law of heavy things, and in this matter do as does the blood of animals, which always moves from the sea of the heart and rushes to the top of their heads, and which there bursts the veins, as we see (when) a vein (is) broken in the nose that all the blood from below raises itself to the height of the broken vein. When the water comes out of the broken vein of the earth, it follows the nature of other substances heavier than the air, whence it always seeks low places. . . . That the blood which returns when the heart reopens is not that which closes the doors of the heart."

Of this we can only say that it does not seem to attempt to explain the motion of the blood by springs of water, but the reverse. Nor in the claim to have discovered the attraction of gravitation does the case seem clearer. Da Vinci has been considering, apparently, the question of a falling weight, and asks:

"Why does not the weight, O, remain in its position? Because it has no resistance. And whither does it move? It moves toward the centre. And why not in any other direction? Because the weight which is not resisted (supported) will fall to the depths by the shortest line, and the lowest place is the centre of the world. And how does the weight know thus to find it with such quickness? Because it does not go like a senseless thing, first meandering by various lines."

In the suggestions on the moon are several which seem to be of the nature of problems proposed to himself, and not yet satisfactorily solved:

"Nothing that is less heavy remains under what is more heavy; if the moon has position in the midst of its own elements or not; if she has not a particular position in the midst of her own elements like the earth, why does she not fall to the centre of our elements? And if the moon is not in the centre of our elements, and does not fall, she is lighter than another element. And if the moon is lighter than another element, why is she solid and not transparent?"

It is clear from the complexity of these hints that the problem of gravitation was very far from solved by Leonardo in the sense that Newton solved it. He has a hint, apropos of observations of the magnifying of the moon at the horizon by refraction, which points very near to the telescope: "Fa occhiale da vedere la luna grande"—make eye-glasses to see the moon magnified. In the chapters on water-courses he uses the blood again as an illustration. "I say that as the natural warmth keeps the blood in the veins at the highest part of the man, and when the man is dead the blood cooled falls to the lower places, and when the sun heats the man's head it increases and so much blood comes up that often it produces headache"—so, he continues, the water rises by the veins in the earth to the tops of the mountains. One of his sketches prefigures a life-preserver, another a naval ram, others flying-machines; and there are chapters of machines proposed or invented. Far from the least remarkable thing in his record is the sudden dash he seems to make at a physical law, then leaving it without any further study, as if a flash of inspiration had shown him his way and then had abandoned him.

The translation into English is inexcusably bad, and makes a most regrettable blemish in a work of such surpassing general merit. The sense is often quite lost in the English version. In § 715, "Questo si potrebbe fare, fatto il fornello ferma [*sic*] e pillata [*sic*]," is translated: "This may be done when the furnace is made strong and *bruised*." Now "pillato" in the given version is, as we see by a note, written *pilata* in the original—*i. e.*, supported by piles (*pila*)—and the translator, a little further on, § 739, renders "il fornello de' essere infra pilastri ben fondati," "the furnace should be in the midst of piles well driven in." The figures illustrating the two sections show that they relate to the same point. In § 860 we find "e perchè lo sa così tal peso trovarlo con tanta brevità? Perchè non va come insensibile, prima vagando per diverse linee"—*i. e.*, because it does not go like a senseless (obeying no impulse) thing, wandering about by different lines (of motion). This the translator renders, "because it is not independent, and does not move about in various directions." § 1147: "Ogni nostra cognitione principia da sentimenti"—*i. e.*, all our knowledge begins in sensations; which the translator renders, "all our knowledge has its origin in our preceptions" (*sic*). "O ritrovato nelle storie delle Spagnioli, come nelle guerre da loro avute colle Inglese *fu* Archimede Siracusano, il quale in quel tempo dimorava in compagnia di Ecliderides, re de' Circodastri; etc.," is translated, "I have found in a history of the Spaniards that in their war with the English Archimedes of Syracuse, who at that time was living at the court of Ecliderides, King of the Circodastri. Etc." § 613, "acquavite" is translated aquafortis. There is a pervading negligence as to faithful translation of the peculiarities of expression of the original, not to speak of careless proof-reading, curiously out of keeping with the minute attention given to the Italian text; but as the original and translation are given in parallel columns, the reader who understands Italian can correct the English. He who does not will not always be able to understand the latter, which, even when strictly grammatical, is incomprehensible without comparison with the original.

RECENT NOVELS.

The New Abelard. By Robert Buchanan. Harper's Franklin Square Library.

The Miz-Maze, or the Winkworth Puzzle. A Story in Letters. By Nine Authors. London and New York: Macmillan & Co.

Only an Incident. By Grace Denio Litchfield. G. P. Putnam's Sons.

Susan Drummond. By Mrs. J. H. Riddell. Harper's Franklin Square Library.

A Real Queen. By R. E. Francillon. Harper's Franklin Square Library.

The Loyal Ronins. Translated from the Japanese by Edward Greey and S. Saito. 2d ed. G. P. Putnam's Sons.

Treasure Island. By Robert Louis Stevenson. Boston: Roberts Brothers.

Vestigia. By George Fleming. Boston: Roberts Brothers.

Newport. By George Parsons Lathrop. Charles Scribner's Sons.

Hester: A Story of Contemporary Life. By Mrs. Oliphant. Harper's Franklin Square Library.

Old Lady Mary: A Story of the Seen and the Unseen. Boston: Roberts Brothers.

In 'The New Abelard,' sustained, serious idea and absorbing story are cleverly combined. There is no discoverable reason for the mysterious introduction of Ambrose Bradley and Alma Craik in Mossleigh Abbey, by the light of the May moon, to the music of the sounding sea. But the scene is romantic and impassioned; the reader plunges into the thick of complications and learns incidentally that the owls of the region are rather queer, for they "*moaned* from the ivied walls." The construction of at least two-thirds of the book is excellent. The life and love of the New Abelard and Héloïse illustrate admirably the vagrant tendency of modern religious thought, and the objective interest and the subjective are inseparable. But the "monster spiritualism," which in the later chapters besets the path of Abelard, is a puny, a tawdry antagonist to rank with the "monsters agnosticism and materialism." The episode is, too, unnecessary and disfiguring, and the chosen variety of American medium has already had a long run in English novels, where alone he comes in contact with decent society. The last chapter, at

Oberammergau, is theatrical, presenting those mechanically deliberate effects with which Mr. Buchanan mars his work. There is, on the other hand, an impetuosity about him which often prevents his executing carefully what he has conceived vigorously. In the development of the apostate, Bradley (Abelard), the vital need of a practical, orthodox Christianity in crises of temptation and trouble is not established, and though in dealing with dogma the author wholly escapes dogmatism, Bradley's career was meant to prove, in his own last words, that "Man cannot live by the shadowy gods of men, by the poetic spectre of a divine ideal."

The great sin of Bradley's life, his treachery to Alma Craik, is not proved to be the outcome of unconscious drifting from a transcendental creed, through agnosticism, to materialism. Indeed, it cannot be reconciled on any theory with the intellectual keenness, the lofty idealism, the spiritual intensity ascribed to him. It is the act of a man infirm of purpose, stupendously selfish, and with incredibly small vanity. Regarding Bradley impartially, we may be pretty sure that, had he wrapped himself in the Articles and sat forever at the feet of "Darkdale and Dells," he would have deceived and degraded Alma Craik. In any case he would have gratified his selfish passion, and he would not have exposed himself to public criticism by procuring a divorce from his infamous, unacknowledged wife. The drawing of Alma redeems this partial failure. In her purity and passion, in the abandon of her sacrifice, Héloïse lives again, fashioned by a poet. The poetic quality of Mr. Buchanan's novels is always noticeable. In this one he shows as well a quick, if not profound, perception of the world's drift, nice discrimination of character, and the conversational readiness of a man who, talking frivolously or earnestly, talks well.

'The Miz-Maze' is so transparent and guileless a story that there must be humor lurking in the title. The nine authors probably enjoy the joke, but it is too subtle and delicate for the uninitiated to take readily. The authors must have been aware of the ridiculous inadequacy of the reason given for plunging even that wonderfully-used person, an English baronet, into eighteen years of profound silence concerning the existence of his eldest daughter. They can hardly have overlooked the facts that in the forty-third letter the trivial cause of Sir Walter Winkworth's long absence from his estate is fully explained, and that the remaining one hundred and nineteen are devoted to matters as little mysterious as is the blowing of soap-bubbles. Beyond the inscrutable humor of the title, there is nothing remarkable in the story. Any writer of mediocre ability might have produced a more readable novel in letters, and it is to be doubted whether one man or woman could have been so uniformly feeble, so monotonously prosaic. The letters of Aunt Dora smack of Miss Yonge, and to her is probably due the credit of the helplessly-stupid hero, Miles Winkworth. Beyond this, conjecture is all at sea, and one closes the book, dissenting from the motto on the title-page, "Many hands make light work." 'The Miz-Maze' proves that many hands make *heavy* work.

'Only an Incident' has the virtue of modesty which its title implies. The author is quite at home among the favored people of Joppa, and touches their blind self-sufficiency with a vivacity which is in no way allied to spitefulness. This thorough familiarity with the manners and habits of a small community may perhaps account for an unconscious use in narrative of colloquialisms which are often vulgar and not infrequently ungrammatical. Out of her own sympathy with the unfortunate little heroine, the author has exaggerated her virtues; she has converted a possible tenderness for sweet and helpful activity into contempt for excessive amiability. In Miss Geraldine Vernor she has attempted a character beyond her power of delineation, betraying inexperience and a somewhat immature perception. A radiantly beautiful girl with a virile intellect may have her little defects, but the wild contradictions of ill-bred cruelty to young brothers and sensitive regard for the comfort of a beetle, of cold, hard selfishness and impulsive heroism, make actual monstrosity. Denham Halloway is another false ideal. It is a matter of history that well-meaning young rectors have loved several women for their several virtues. Still, we doubt if the man who almost loved Phebe Lane could fall a victim to Geraldine, even if he had much fuller opportunity than the reader for discovering that she only "beguiled the thing she was by seeming otherwise."

In 'Susan Drummond,' as in most of Mrs. Riddell's work, the tantalizing impression that it ought to have been better detracts from enjoyment of much that is really good. Here an inspiring motive is more than usually conspicuous by its absence. The plot is absolutely unconsidered, and there is no evidence that the author ever heard of a theory of artistic and satisfying construction. In the first half, she backs and bolts and ambles at will, as if she took a vicious pleasure in bewildering the reader. She rouses no interest in the story beyond a mild wonder whether the canny banker and ex-cavalryman, Gayre, is to have all the running with Susan Drummond. In the last half, the introduction of Susan's lover, Dane, and of his unjust imprisonment for forgery, is an arbitrary interjection of an exciting element for the benefit of the sensation-loving public. It is in her keen comprehension of a large variety of character, in her delicate distinction between what may be told and what must be insinuated, in her facile and apt expression, that Mrs. Riddell shows her mettle. Though she is none too fond of her women, both the acrid Miss Chelston and the excellently clean and healthy Susan are solid figures, standing firmly on their feet. In the boldly contrasted Gayre and Sir Geoffrey Chelston there is striking power, in Sir Geoffrey an infectious enthusiasm. His life outrages decency. He is of that irreclaimable herd of black-sheep who attribute all their misfortunes to heaven. But by suppressing the detail of his vices, by endowing him with a comical audacity and racy vocabulary, the author has forced an acceptance of his own verdict on himself, that he "was a good deal better than some, and not half as bad as most." One can hardly leave this novel without comment on a social condition which English story-tellers seem to vie with each other in thrusting upon public notice. If they are to be believed, the English are something lower than a "nation of shop-keepers": they are a nation of money-grabbers. They not only barter traditions for wealth, but their gentlemen haggle like fishwives for small change.

'A Real Queen' is an English girl, carried out to sea in a boat by an escaped convict, and picked up by a Spanish trader bound for the South Sea. She is wrecked and cast ashore on the Island of Apahu, where the natives hail her as a queen sent by the gods. After ten years she comes home and helps to unravel a plot in which figure prominently a trap-door, a secreted will, a pair of rare villains, and the ex-convict, now a sort of bonanza king from Nevada. It is plain enough that before an author attempts such an extravagant story he should be sure of his power to produce fairy-tale illusion. If Mr. Francillon could have made us believe in Apahu as we believe in that island in Oceanus, unseen and untrodden by mortals, whereon grew the golden apples of Hera, the fact that the "most learned geographers had never heard of it" would not trouble us at all. If by his picture of that ideal kingdom where there was an "atmosphere of heavenly fragrant balm," where "there were no wars, no seditions, no parties, no crimes, not even poverty," he could have made us live for an hour in the Golden Age, we would not be inquisitive about the possession by "heathen savages" of a "complex and ancient system of ethics." But he has lacked the skill to hide absurdities and incongruities. So little real are the queen and her kingdom that neither sympathy nor regret is excited when Great Britain annexes Apahu and we take leave of the gentle Apahuans, "all as drunk as if they had been civilized all their lives."

In its new dress, the Japanese romance of 'The Loyal Ronins' looks less like a dinner-plate and more like a book. The day of flamboyant covers, let us hope, is nearly over; and since less is put on the outside of this standard work, let us further hope that the contents will be more appreciated. The story of the loyal-hearted league of Samurai, or gentlemen, who avenged the death of their master, is one of undying interest to the Japanese, and is perhaps for us the very best mirror of the mind of feudal Japan. Though called a romance, it is in reality a leaf of true history, only slightly colored by the novelist's art. The historic details, and the genuine relics still preserved in the temple in Tokio, not far from the cemetery in which the Ronins are buried, are well described by Mitford in his 'Tales of Old Japan.' The writer once paid a visit of investigation to that part of Tokio in which the culminating act of the story took place, and which now bears socially the same contrast to its former condition as the Pearl or Dey Street of to-day and of a century ago. Though every relic of the past in the form of house or building of any sort had long since disappeared, and lumber-yards stood on the site of old baronial mansions, the streets and alleys still bore the historic names so familiar in the story. The translation of Messrs. Greey and Saito, though far from literal, preserves most of the really characteristic color idiom and phrase of the original, and, being condensed, is much more readable on that account. Besides the honor of further re-translation of his version into German, Italian, French, Swedish, and Spanish, Mr. Greey has been honored with the thanks of the Mikado, and Mr. Saito has been appointed to a secretaryship in the Foreign Office in Tokio, after assisting our Minister, General Foote, during his first experiences in Séoul, Corea. The publishers have wisely retained all the original native illustrations, and reset the text on white paper having the same liberal margins as in the first edition.

Enveloped in a quaint binding, emphasized with cuts of ships of two centuries ago and symbols of the navigation of the past, Mr. Stevenson's 'Treasure Island' is a nautical sketch, yet it is not. It tells of pirates of renown, of buried money on an island beyond the seas; but gives us no description of storms or shipwrecks. Herein we have to thank the author, for one storm at sea is very like another, every manner of shipwreck has been described over and over again, and the often repeated technical resources of the sailor in moments of peril have a monotony with which we are glad on this occasion to dispense. The feminine element is entirely wanting. Notwithstanding this disregard of the conventional rules which ordinarily govern the construction of the nautical yarn, Mr. Steven-

son has written a book which has not a single dull or uninteresting line from the commencement of the opening chapter to the end of the last. The "Treasure Island" is near Savannah. The date of the story is toward the end of the seventeenth or the first part of the eighteenth century. Flint, a noted pirate, buries the money in a spot unknown to his crew. He dies, and the chart he has made of the exact locality falls into the hands of Billy Bones, his first mate. The circumstances under which it passes from his possession into that of Jim Hawkins, the son of a tavern-keeper, and subsequently into the care of Dr. Livesay and Squire Trelawney, are graphically described in the opening chapters of the book. Squire Trelawney fits out a schooner for the recovery of the treasure. How he fared we must not relate.

"George Fleming" has again chosen Italy as the scene of a novel, though in exchanging Rome for Leghorn, and in choosing her characters from humble fisher folk, she has placed herself on entirely new ground. Yet to name the characters in 'Vestigia' is to suggest familiar and oft-tried combinations—an old fisherman and his lovely daughter, an ardent young patriot with his foster-brother, handsome, gallant, prevailing ("A Balbi does as he pleases"), and, in the background, a secret society striving to win liberty by the hardest of tyranny. "To stab a King is no more an act of vengeance than the sentence of a judge." But the reader who presupposes therefrom a commonplace novel will find that he has never been so completely and so agreeably surprised. Such a story puts the reviewer to extreme disadvantage. To praise it as it deserves would be treason to his own readers as well as to the author, for due comment upon the plot would betray its secret. Not that the interest, the surpassing charm of the story depends on mystery, or on involved intrigue. It is not the solving of a riddle, but the development of two or three simple, noble motives; and the conclusion, however tragic, throws over the whole previous story a clear white light of truth and purity. The action is much simpler than anything the author has before attempted, and her style has gained correspondingly. Her hand is more sure, and the lines are more distinct. There is only so much of the fair Italian sky and sea as to throw into relief the figures, but so deft, so sympathetic is the choice, the few pages give the sense that all Italy is in the book. Realistic study has led us into such darkened, grimy ways that it is like a ray of returning sunshine to feel again that humble life need not be low life, that laborious days need not always be sordid and base, that hope, and filial love, and unselfish devotion illumine the poorest home.

Since we have barred ourselves from telling the story, some parallels may be pointed out in which it is not so much the likeness that is remarkable as the difference in the likeness. "Yes, Dino, *because* you love me," falls on the ear in the old cadence, "loved I not honor more"; but it is the sweet, full voice of a slender girl with sad eyes. Less obvious, but more curious, is the comparison with Browning's poem, "The Statue and the Bust." There is no resemblance in character, incident, or intention, but the two themes, the two motives are identical—the power, the value of *conduct*, wholly apart from the immediate, tangible result. Browning approaches it from the negative side,

—"the unlit lamp and the ungirt loin"—

George Fleming from the affirmative—"the sense of having lived a faithful life." They who have suffered disappointment in far nobler causes may take heart from the words of Valdez in his high-walled cell:

"When a man has meant anything strongly there is never any real going back again for him. It isn't the failure or the success, it's the purpose, the will that is in him, that makes the difference. . . . To keep faith at any price in any fashion; to do it, even grudgingly, counting the cost, looking back at the world with all its temptations, yet, even then, moving away from them, however slowly—well, even that is enough to give some touch of divine dignity to a life. It is reaching the end without the glow of triumph, but still the end *is* reached. We can't all of us claim the praise as well as the victory, and yet the victory is there."

'Newport' is Mr. Lathrop's best work, and this, without counting for his benefit the advantage the book gains by contrast with the last story having the same scene, 'Aquarelle.' He has made as good a picture of the life there as could be made by one who starts with a distinct *parti pris*. To him the pageant seems hollow, and the best of the participants walking as in a vain show. An opportunity, therefore, is still left to give the whole Newport as it is, not merely as it is colored to one set of eyes. It is a unique opportunity, in this day when every possible field for fiction has been so carefully searched. The world has perhaps never before seen so much money gathered in one place for pure amusement, in the absence of all traditional restraints, with so few recognized claims upon it, and with no original, innate ideals. Of all this, not so much has yet been given as of New York thirty years ago, in the 'Potiphar Papers' and in 'Prue and I.' True, Newport is a subject vastly more complicated, but so much the more is it worth study. Mr. Lathrop has chosen his characters well, selecting them as types without sacrificing individuality. With incidents he is less happy. A tragic catastrophe may come as well one way as another, so that we take no exception on that point; but the whole acquaintance of the hero and heroine is strangely managed. It is in the line of French plots to choose mature personages, to study second or later love, but character and conduct must correspond. Oliphant and Mrs. Gifford are well conceived and well posed for their parts, but they immediately act as absurdly as the youngest of young lovers. The critic who pronounces a thing unreal is always liable to be confronted with actual fact, yet improbable is the gentlest word that can be used of the incident of the letter. That Oliphant should not have destroyed it is as unlikely as that the lady receiving it should then and there have felt an "impulse of revenge," for which afterward a lifetime of repentance seems too short. Aside from one or two infelicities of phrase, there is marked gain in style. Old Thorburn's last appearance is a needless shock, a grotesque effect out of place. But there is almost none of that over-refining which has sometimes become whimsical. If once or twice the fancy for subtlety betrays the writer, as at the end of chapter eighteen, it is really powerful in conceptions so entirely different as the picture of the old schemer waiting in his web, or that of the light on the dead man's face.

Washington, like Newport, presents aspects of society unknown elsewhere, if, indeed, it is not necessary to say life, instead of society in the accepted sense. Newport is, at least, growing toward a permanent, distinctly outlined form of society. On the contrary, in Washington, small as any constant nucleus has ever been, its influence is now slight in the scale as weighed against the very new money and the crowd of mere passers-by who take a month there as a part of the winter's amusement. It is no 'prentice hand that can combine such fluctuating material in a society novel. 'Democracy' was only a sketch, as rough as it was clever. Mrs. Burnett imagined a story of great interest and power, but it depended for its accidents, only, upon Washington. The author of 'Her Washington Season' has been moved by the dark shadows in these pictures to give what, in a confusion of metaphors, she calls "the other side of the mirror," "under the rose." Consequently we are introduced, under Southern auspices, to a sublimated world of secretaries and diplomats, with "the Executive Mansion" (*sic*) always closing the vista. The point of view is that of the more modest newspaper correspondent, and the style a late survival from *Godey's Lady's Book* of forty years ago. The leading incident is the hackneyed one from German fiction, of the separation of husband and wife on the wedding-day. Throughout there is betrayed about an equal ignorance of the ideas of counts and honorables, and of the capacities of $750 a year. It is useless to dispute the established dictum that anybody can write a novel, but at least it takes more than well-intentioned inoffensiveness to write a good one.

The marked advance shown in 'The Pagans' upon any previous book by the writer makes it worthy of a consideration not due to its actual merit. Such plot as it has would involve a serious question of honorable obligation, were it not for the impossibility of the supposed circumstances. Some pleasant local coloring and some gentle sarcasms upon Boston superstitions have gained for the book a momentary fame, but, for ourselves, without meaning to take it too seriously, we find much to disapprove in both subject and treatment. We are shown a little band of artists who have vowed themselves to truth only; but each man is to be his own judge of truth. Christian morality is a failure. The device of the book is: "Bind on thy shoulder the thread of paganism; throw stones at the glass of piety." The men are capable of haranguing, in the presence of a good woman, about "the loftiness of vice" and "the splendid caress of sin," while they ask, "Who now would read a novel about virtuous people?" And he who pronounces "marriage a crime" does not hesitate to say, to the same woman, of his young wife: "Her innocence bores me." No further proof would seem to be needed that the book is bad. On the contrary, it is only illogical and weak. To maintain in theory and by practice the sacred right of suicide is the extent of the protest against established conventions; and the worst sin in the eyes of the Pagans is to marry a daughter of the Philistines and to paint pictures which her kindred will buy. Deeper study of life should have shown the writer that, restraints once broken as by his premises, there is no way onward but downward. It may be better to be false to reality than to be immoral; but why be either? As with 'To Leeward,' why choose subjects where success requires such dangerous representations? "The philosophical novel, . . . the study of scientific atheism, . . . a study of life with God subtracted from it" (as the author called it) has been attempted before, with a success that proved the lasting condemnation of the book. That Mr. Bates has failed is perhaps to his own moral credit, or perhaps to the traditions which he and his would deny if they could. "Where is Puritanism?" triumphantly demands a scoffing Pagan. "In this very book," is the instant answer. Unsuspected by the author, its influence so leavens his own imagination and his consciousness of his readers, that to carry the story to logical conclusions is impossible. Our argument may be more weighty than this special book demands, but 'The Pagans' represents a class that ought not to be encouraged. Not the least of the harm done by doubtful books is so to confuse the moral sense that a novel shall seem good if it only, however falsely, leaves out the bad.

It is difficult to make out upon what theory of novel-writing are produced such stories as

'Prusias,' and, indeed, the majority of the series to which it belongs. Certainly not upon any supposition that pleasure is to be derived from them, for a more hard and brutal story could not be imagined than this and the one preceding. Nor can instruction be really their object, for, though the present book deals with an incident so significant and, in a way, so heroic as the revolt of the gladiators, the writer declares frankly that his hero and principal personages are all fictitious, and that the facts even have been altered to suit his story. The notes are very curious, presuming that a person capable of being interested in so elaborate and artificial a story does not know the a b c of classical allusion. It is a pity that evidently superior ability in translating cannot find more worthy material.

Two tales from Mrs. Oliphant's busy pen fall together upon our table. 'The Wizard's Son' is in her less pleasing manner, the plot being of the mysterious and exciting kind; but she manages her old castle and her enchanter or her ghost better than anybody else now writing can. The reader's approval of the tale will vary in proportion to his willingness to put up with unexplained mysteries, but all will agree in the charm of the young girls. 'Hester' herself is as delightful as any that Mrs. Oliphant has ever drawn, while so different from the others as to strengthen the opinion long prevailing in circles where her books are enjoyed, that she must take each one carefully from life, for how could one imagination supply so many? We by no means intend to suggest a tired pen or an exhausted fancy when we say we wish this particular plot, or rather the principal situation, had been Mrs. Oliphant's subject in earlier, fresher years. It is new and original, turning not at all for its main interest upon wooing or winning, but upon them utual relations of two women—but one is little more than a girl, "fresh, fair, strong, . . . like her namesake in the poem." The other is at the end of a long, well-filled life. "For the rest of her days she meant to keep Sunday resting from her labors." The eager, rash sincerity and unselfishness of the one, in contrast with the distrust and jealousy of the other, afford a study more interesting than most love stories.

The little sketch 'Old Lady Mary' is understood to be also by Mrs. Oliphant, although her name does not appear. It may be called a sequel to 'The Little Pilgrim,' but it is the very reverse of it. It is an extremely well-managed story of a *revenant* (ghost is not at all the word). The picture of soft, gentle age, *la vie cossue*, as the French say, is almost too good, as it for the moment distracts from the special effect intended; but reflection restores the relative value. The pathetic helplessness of the repentant is most touching, and to not a few there will be something painful in its suggestion of possible experience. It was exceptionally fine art that could carry out the idea on the simplest well-known lines of folk-lore, though starting at the opposite extreme of human life.

Fallacies: A View of Logic from the Practical Side. By Alfred Sidgwick. D. Appleton & Co. 1884.

CAN anything be done by systematic precept to cultivate the power of criticising arguments? This is usually supposed to be one of the aims of logical study, but it is also a widespread opinion shared by some high authorities, that the traditional logic, the logic usually taught in colleges and universities, actually accomplishes little or nothing in this direction. Thus the editor of *Mind*, the English quarterly devoted to psychology and philosophy, who is himself Professor of Logic in University College, wrote, a few years ago: "For all that appears, the adherent of the old logic gets little or no benefit from his science the moment an argument becomes truly complex and passes beyond a small number of rigid forms." Mr. Sidgwick is strongly of the same mind. He says (p. 289): "Nothing could well be more confusing than an attempt to apply the cumbrous machinery of the syllogism to arguments met with in real life. And whoever has tampered with his mother-wit by substituting for it a clumsy logic depending on elaborate mnemonics, must no doubt pay the penalty in loss of power, so long as the mischief remains."

In the present volume, the latest addition to the "International Scientific Series," Mr. Sidgwick, who is already known to readers of *Mind* as a writer of originality and power, makes an extremely vigorous attempt to show a more excellent way. Whereas the universal practice of logicians has been to discuss fallacy in a subordinate and half-apologetic fashion, he brings this subject to the front and makes it the *raison d'être* of logic. Viewing logic as "a machine for combating fallacy," he takes the word fallacy in the broadest possible sense, as signifying "any mental confusion whatever" (p. 173). Then, as "any pretended assertion may be, 1, meaningless; 2, mere unsupported assertion; 3, insecurely supported" (p. 24), we get a primary, threefold classification of fallacies, which is further subdivided in the sequel. The whole treatment is a very marked advance upon anything that has been accomplished in the same line, even by Whately, Mill, or Bain.

One signal merit of Mr. Sidgwick's discussion is his firm grasp upon the distinction between discovery and proof. He never allows his readers to forget that his business is solely with the latter. Any one who knows how even Professor Bain has slipped in this respect, will appreciate Mr. Sidgwick's unwavering consistency. But, above all, the book is to be praised for being everywhere thoroughly alive. The author has his eye fixed, not on the artificially simple, often pedantic and frivolous arguments of ordinary logical text-books, but on the actual arguments which do duty in the world. He insists, too, again and again, that the critical habit may easily be pushed to excess. It is only on occasion that we may profitably undertake the exhaustive examination of a piece of reasoning. But such examination must sometimes be made, and we can cordially say that for doing the work well, the thorough assimilation of Mr. Sidgwick's book would be an invaluable preparation.

While the author never loses sight of his immediate practical purpose, he throws incidentally a flood of light on some matters of speculative interest. Thus the well-worn but still puzzling question as to whether the syllogism is a *petitio principii*, and the difficult subject of the mutual relations of deduction, induction, and analogy, receive at his hands a fresh and luminous treatment. Here and there we notice a slight slip or oversight, which will serve to whet the interest of the critical reader. Thus we are told (p. 221): "Any categorical argument may be expressed in hypothetical form, and vice versa." The last part of the statement needs restriction. All depends upon whether the "major premise" is or is not what Goodwin's Greek Grammar calls a general condition, or what Mr. Sidgwick calls an abstract proposition. If it is not, then the transformation is impossible, though some logicians, as Jevons, have attempted the feat and imagined themselves successful.

On one point of more importance we feel compelled to register our dissent. The preface announces that "this book is intended mainly for the general reader. That is to say, it requires no previous technical training, and is written as much as possible from the unprofessional point of view." The fact is, that whoever enters on the book without an understanding of all the ordinary logical phraseology, will find his path a thorny one, and will probably soon abandon it in despair. But teachers of logic, if not utterly incorrigible, will find Mr. Sidgwick a most stimulating guide, and through them it is to be hoped that his lessons may be impressed where most they are needed. Only, if any such instruction is to be effectively given, it must be by means of examples. Any one who should bring together a good number of live arguments of a tolerably homogeneous character, and not too abstruse, arranging them so that they could be conveniently studied in the light of Mr. Sidgwick's 'Fallacies,' would be doing a good service to the cause of education.

The Life and Times of Seargent Smith Prentiss. By Joseph D. Shields. Philadelphia: J. B. Lippincott & Co. 1884. 8vo, pp. 442.

MR. SHIELDS remarks upon an unreported speech of Prentiss's—"one of the greatest efforts of his life"—at a certain Southwestern river town and county seat: "Alas! there is no spot upon which to erect even the epitaph of *Ilium fuit:* the remorseless maw of the Mississippi has long since swallowed up the site, and even the name of the little village has been erased from the family record of the State of Mississippi." One cannot but feel that Time has, more or less completely, done for this orator's memory what the Father of Waters did for Princeton. The present tribute of an old pupil may symbolize, in its substantial and costly form, a fresh levee raised against the stream of oblivion, which in the end will nevertheless prevail over it. The dam is not altogether new; on the contrary, so much of the material has been derived (with all frankness) from the well-known brotherly 'Memoir' reprinted some five years ago, that only the age of the writer, and his devotion to the friend of his early childhood, can excuse this fresh tax upon the book-buying public. The few additional personal reminiscences and anecdotes are not striking enough to be quoted, and throw no new light on Prentiss's character. Many of the details of his political career in Mississippi possess but little interest for outsiders, and, we fear, at this date, even for Mississippians. Two reports made while he was Chairman of the Judiciary Committee of the House are given, and one, which relates to Indian land titles, shows how completely he was prepared to follow State sovereignty into rebellion. The founding of Vicksburg is described somewhat minutely as an introduction to Prentiss's land speculation, which here receives fuller treatment than at the hands of his brother. The second duel with Foote is also much more particularly recorded, and the same may be said of the circumstances attending the defence of Judge Wilkinson, at Louisville, Ky. To this discreditable service Prentiss is here represented as coming down the river in a state of hilarity which caused the gravest apprehensions on the part of his client. Mr. Shields's view of duelling and of unpunished homicide is noticeably more wholesome than that which prevails among Southerners generally, though he appears to be confused at times by intercepting notions of honor and chivalry. He recalls the wasteful and costly habit among young men of practising pistol-firing "at the word," with "a tape-line, the height of a man, stretched upon an upright pole or tree for the target." Prentiss joined in this, sharing the "idea" of his associates, "to be always ready for the *chances* and changes of this Southern life." We have the correlative of this idea in his settled unwillingness to prosecute a criminal for a capital offence. "He did not like to take 'blood-money'—that

is, to receive pay for helping to have a man hanged." In this, as in so many other ways, he had become as Southern as any native of his adopted section.

Mr. Shields has thought himself fortunate in rescuing from the files of a New Orleans paper what he terms "the last effort of Prentiss's master mind," namely, his professional defence of the Cuban filibuster Lopez. His argument was unsuccessful then, and it is now flimsy enough in the light of the lessons of the *Alabama* case. It might better have slumbered in the journal for which it was reported. We learn some facts, not without interest, concerning Prentiss's descendants (a son perished in the civil war), and the volume is still further distinguished by a portrait of Prentiss, apparently from an oil-painting, though one is at first inclined to infer a daguerreotype. The 'Memoir' was unaccompanied by any.

Flowers and their Pedigrees. By Grant Allen. D. Appleton & Co. 1884. Pp. 246, 12mo.

THIS is one of the popular-science books of a kind now common in England, in which material perhaps first used in popular lectures, and then as magazine articles, is finally collected into a volume, and a part of the impression supplied for the American market. The present volume is easy and interesting reading, is well adapted to excite and in the main to gratify curiosity as to how a daisy came to be what it is and where it is; how a strawberry plant is related very closely to a cinquefoil, and less nearly to a bramble and a rose, and so of other genealogies, some fairly made out and some not so, but none the less confidently asserted. If its teachings are often crude and not altogether safe, still the audience addressed are sure to be charmed and may not be harmed by the doctrine that wheat is a degenerate lily, and that all showy blossoms began by assuming a yellow color, and are on the way to be white, purple, and blue in succession. The sober-minded naturalist who turns over the pages may now and then be made uncomfortable, almost as much by the way in which a true or a reasonable proposition is presented as by the author's habit of passing off unverified hypothesis and guesses as established truths. For, from the strictly scientific point of view, this little book, and other productions of the same facile pen, may be characterized as Darwinism made easy by turning it topsy-turvy. This "high priori" way is as easy as possible when the ideas have been supplied. But Darwin's way of work was the exact opposite of Mr. Allen's. If the latter had taken more to observation under guiding ideas, he might have explained the actual mode in which the pollen of the daisy he describes is placed within reach of visiting insects. And if his genius for speculation were better instructed, we should hardly have been taught that the strawberry originated in Europe from a certain white potentilla, and has been distributed by birds across severing oceans, even the Chilian strawberry "carried over at first, no doubt, by some weather-driven bird to its southern Pacific habitation."

Twelve Months in an English Prison. By Susan Willis Fletcher. Boston: Lee & Shepard. 12mo, pp. 478.

THE heroine of a spiritualistic *cause célèbre*, Mrs. Susan Willis Fletcher, who was lately convicted of obtaining money on false pretences, and imprisoned for a year in England, has written a book about it. It is not very savory reading, though the picture of the Fletcher family is not without a lesson. The victim, a Mrs. Hart Davies, an attractive but weak and dissolute English woman of means, employed Mr. Fletcher as a magnetic physician; and having speedily contracted an intimacy with him which was encouraged by the wife, she soon after left her husband and went to live with the Fletchers, who represented to her that they had communications from her deceased mother (to whom she was devotedly attached) directing her to place her property in the hands of the Fletchers, which she accordingly did.

The whole party then went to America together, and a curious party it was. Mrs. Fletcher had been married at fourteen, divorced, and married again, and gives her family scandals with nauseating fulness. Mrs. Hart Davies had been divorced for adultery, and had now abandoned her second husband. One of her former lovers, a Captain Lindmark, was also of the party, a man who was not above volunteering details of the previous *liaison*, and even giving up the lady's compromising letters. The whole party was evidently an extremely emotional one. They styled themselves a "Social Trinity," in which Mr. Fletcher represented wisdom, Mrs. Fletcher work, and Mrs. Hart Davies love, and love of a very demonstrative kind, with "countless kisses" for the gentleman. After a while Mr. Fletcher is supplemented by a young clergyman, and then by Captain Lindmark, and at last by a Mr. Mack, alias McGeary, who separates her from the Fletchers and brings about the final catastrophe.

Mixed up with these easy attachments and others that are only hinted at, were the usual jealousies of each other and of temporary additions to this elevated circle. Generally the names and details are given with libellous frankness. At last comes the final quarrel, followed by abortive charges of larceny in this country, and the trial and conviction in London on the charge of obtaining money on false pretences. The trial seems to have been a fair enough one. The main thing that Mrs. Fletcher objected to was the exclusion of evidence of other spiritualists as to their belief in spirit communications; but it is difficult to see what bearing it had on the case. It was not expert evidence. The matter was not one of reputation, where common repute is a fact in issue. The jury simply had to decide whether the special representations made by the Fletchers to Mrs. Hart Davies about her mother were fraudulent or not; and the trustworthiness of other communications to other people at other times had no apparent legal bearing. There was no doubt that the representations were made, and the jewels, etc., given to the Fletchers. The Judge told the jury very properly that it would be shocking to suppose that an honest belief in spiritualism was a crime according to the laws of England, and that the only question for them was whether the pretended messages were fraudulent concoctions of the defendants; and it seems pretty plain from the evidence that the jury might have accepted every dogma of spiritualism, and yet have decided that Mrs. Hart Davies was worked upon, through her vicious propensities, to part with her property under fraudulent pretences of messages whose improbability appears very strongly on their face.

The Westminster prison, to which Mrs. Fletcher was sentenced, is described as an unhealthy place, where she suffered from cold, darkness, and hunger; and she gives a shocking description of the systematic means used by abandoned women under sentence there to seduce the young girls to immoral practices on leaving—remarks which no doubt are too often true of our own jails.

BOOKS OF THE WEEK.

Ayres, Anne. The Life and Work of William Augustus Muhlenberg. New edition. A. D. F. Randolph & Co. $1.50.
Corey, N. C. Not Like Other Girls. A novel. Philadelphia: J. B. Lippincott & Co. $1.
Emerson, Ellen Russell. Indian Myths, or Legends, Traditions, and Symbols of the Aborigines of America, compared with those of Other Countries. Illustrated. Boston: J. R. Osgood & Co.
Washburn, E. W. The Spanish Masters: an Outline of the History of Painting in Spain. G. P. Putnam's Sons. $2.00.

HENRY HOLT & CO., N.Y.,

HAVE READY:

Life and Poems of Theodore Winthrop.

Edited by his Sister, with portrait. 12mo. $1.50.

Called Back.

A fascinating novel. By Hugh Conway. 16mo, Leisure Hour Series, $1.00; Leisure Moment Series, 25 cents.

"It is something in these days to hit upon the plot for a story which, relatively speaking, may be called original, and Hugh Conway has succeeded in doing this. . . . The story has vivid interest."—Literary World.

"In a purely literary sense, worthy of commendation. . . . The reader finds variety enough to keep his appetite always fresh."—Boston Transcript.

Unmounted Photographs

OF ANCIENT AND MODERN WORKS OF ART

Embracing reproductions of famous original paintings, sculpture, architecture, etc. Price, cabinet size, $1 50 per dozen. Send 6-cent stamp for new catalogue, 5,000 subjects.

NEW YORK, THURSDAY, APRIL 10, 1884.

The Week.

THE vote taken in the House on the Trade Dollar Bill is probably the true measure of the present strength of the silver heresy in Congress, and of the attitude of the two parties in reference to it. The clause which required that the amount of silver in the trade dollars should be deducted from the regular coinage of two millions per month, was stricken out, on Mr. Bland's motion, by a vote of 131 to 118. The majority consisted of 112 Democrats and 19 Republicans, the minority of 37 Democrats and 81 Republicans. Three-fourths of the Democrats and one-fifth of the Republicans declared themselves to be still in favor of eighty-five-cent dollars. The division shows very clearly that the bill has no chance in the Senate in its present shape. It proves also that the Democratic party is as vicious and untrustworthy as ever touching questions relating to the currency and finance, and that the Republicans have made wholesome progress in the right direction since the passage of the Silver Bill. The Democratic idea that gold is only good for aristocrats, and that the poor man needs a poor dollar, is still firmly rooted in the councils of the party. This notion pervades the Irish section of the party especially. Gold is associated in their minds with England. With them all gold is British gold, and they fancy that they are showing proper contempt for their enemies in the old world by rejecting the standard of value which prevails there. This is a peculiarly happy Irish conception, and it fits in very well with the notion that a man who works for wages is entitled to have eighty-five cents when he has earned a dollar.

Notwithstanding the adverse majority in the House of Representatives, it is plain that the movement initiated by the New York Chamber of Commerce a few weeks since in favor of a suspension of the silver coinage has had an important effect throughout the country. It has been followed by similar action in St. Louis, Galveston, and many other less important trade centres. It has drawn attention to an evil of the first magnitude, and led to renewed discussion of the silver question in the press. Even the Chicago *Tribune* has been moved to say that we have silver dollars enough for present needs, and that the coinage ought to be suspended until other nations show a disposition to coöperate with us in the interest of bi-metallism. The colloquy between Belford and Kelley while the Trade Dollar Bill was pending, was extremely entertaining. The Colorado statesman planted himself on strictly protectionist grounds, and demanded that the Government should continue to buy silver bullion in order that the producers of the articles might get a good price for it. He taunted Kelley with inconsistency and backsliding, and truckling to foreign influence, because the latter had introduced a bill to suspend the coinage for two years. This was a poor return, in his judgment, for the favors shown to pig iron in the tariff. Mr. Kelley retorted that pig lead was as highly favored as any other pig in the tariff schedule, and that since lead was the residuary product of the silver mines of Colorado, of scarcely less value than the silver itself, no charge of backsliding could rest against him. Another member suggested, in all soberness, that a duty be imposed on foreign silver in order to secure the purchases of the American mint to the home producer. In the discussion of the bill, brief as it was, the opponents of the silver coinage had a very marked advantage. If a general discussion could be brought on, very important results might be anticipated, and the Republican party would certainly be the gainers by it. The timidity of their leaders in the Senate is pitiable in the extreme.

The much-debated Blair bill to "aid in the establishment and temporary support of common schools" has passed the Senate. It proposes to give during the next ten years sums of money, beginning with $7,000,000, and running down to $1,000,000, to the various States and Territories in aid of popular education. The share of each State or Territory is to depend on the proportion borne by those persons over ten years of age within its limits who cannot read and write, to the total number of such persons within the limits of the United States. But no State or Territory is to get any of the money which does not itself expend on education during the first five years a sum equal to one-third of the amount received from the United States, and during the last five years a sum equal to that amount. There seems to be no reason for the bill except the fact that there is in some States much illiteracy with which the local authorities do not try to cope effectually, and that there is in the United States Treasury a good deal of surplus money. That the distribution will cease at the end of ten years, we have no expectation. We are probably witnessing in this bill the beginning of the assumption by the general Government of the whole care of popular education. For nothing is more certain than that the local sense of responsibility about popular education, and willingness to make sacrifices for it, will be steadily weakened in the very States in which it is most necessary they should be strong, from the first day on which the jingle of Federal school money is heard. The experiment is, therefore, a most momentous one. Its educational features are probably far less important than the political ones.

The Conference Committee of Independent Republicans have issued another circular, calling upon all persons who sympathize with the objects aimed at by the organization to send contributions of money to the Treasurer, Mr. Joseph W. Harper, jr., to be used in defraying the necessary expenses of correspondence, publication, and circulation of documents, etc. They say that they propose "to take every proper measure to promote the nomination of a Republican candidate who is a satisfactory exponent of the progressive spirit of the party, and who would command the hearty support of independent voters." Speaking of the reform spirit of the time, the Committee say that it "has constantly proved its sturdy independence at the polls, even to the point of withholding its vote when its vote could not be given without infidelity to political honesty and to Republican principle." This is a frank statement of an undisputed fact, and it has been made many times lately in all quarters where independent sentiment finds expression. We observe that this frequent iteration does not meet the approval of the boomers, and in the *Tribune* of Saturday morning there is a feeling protest against further declarations of this sort. The *Tribune* thinks that hostile remarks about any candidate who has a good many friends will be likely to produce unpleasant feeling, and make party success difficult in November. It believes that when a candidate is supported by a good many sound Republicans who think his nomination desirable, the fact should be noticed with respect. "It is rather a bad habit," says the *Tribune*, "about nomination time, to declare that this or that candidate cannot be elected."

Yet, if we remember rightly, the *Tribune* followed this "bad habit" with commendable vigor four years ago by declaring almost daily, in reference to General Grant's candidacy, that, aside from the third-term objection, it was folly to nominate him, since his election would be difficult if not impossible. Its steady adherence to this view at that time had great influence in defeating Grant's nomination. It took the ground then that it was much better to say, "about nomination time," that a certain candidate could not be elected, than to keep still about it and be forced to make the confession after the blunder of nominating such a candidate had been committed. That was a sound position then and it is equally sound to-day. The third-term contingent, the immortal "306," were a large body of what were called sound Republicans at that time, and they were relying for success on the same specious argument which the *Tribune* makes use of now, that "any man whom the voters of the Republican party, acting with reasonable freedom and through a fairly organized convention, honor sufficiently to select as their candidate, is exceedingly likely to be preferred by the people to the nominee of an effete, incompetent, reactionary, and essentially Bourbon Democracy." The peril of relying upon the effete Bourbon Democracy as a means of forcing the independent voters to support a man whom they do not like, was demonstrated in this State two years ago, and we do not believe the Republican leaders will venture to repeat the experiment this year.

The announcement is made that a conference of Democratic leaders is to be held in Balti-

more the last of this month for the purpose of reconciling the differences of opinion which prevail in the party and prevent harmonious action. There will be a banquet, and all the great men of the party are expected to attend. The plan is not new. It has been tried by the same party before, and with most unsatisfactory results. Somebody always upsets the harmony by telling the truth too frankly. The trouble is, that what the Democratic party needs is not a reconciliation of differences of opinion, but courage. An overwhelming majority of its members believe in their hearts in tariff reform, but only a minority have the courage to avow their belief openly. The rest of them have the curious notion, which no amount of defeat can destroy, that if they keep still on the tariff the people will regain confidence in their general ability to administer the Government. The news was sent all the way from Paris the other day, that Mr. Hendricks was convinced that the way for the party to succeed was to settle its differences on the tariff question. General Gordon spent several hours with Mr. Tilden, and announced to the country as the result of his talk that the Sage made no allusion to the tariff as an issue, but was sure the party could succeed by demanding "reform." A conference of "leaders" who have this kind of advice to offer will be pretty certain to leave the party in the same condition that it was before.

Mr. Dezendorf's testimony before the Sherman Outrage Committee on Monday did not contain anything especially new, but it served to put on record a concise statement of the evils of Mahonism. He said that the Mahone Readjuster Coalition, instead of securing free and fair elections, had the effect of making the elections more unfair; that the coalition existed solely because Mahone was known to have absolute control of all the Federal offices in the State, and that it would have gone to pieces in fifteen minutes if the support of the Administration had been withdrawn; and finally, that if Hancock and English had been elected, the whole Coalition party "would be in the Democratic party to-day—Mahone and all of them." Nobody can successfully dispute the entire accuracy of these statements. Mahone was merely a political speculator, a veritable Johnny or Mike, who went into politics because he saw an opportunity for doing a good stroke of business. He counted upon two elements for success, and he used them both without scruple. The first was the ignorance and blind partisanship of the negro vote, and the second was the unorganized but easily inflamed repudiation sentiment among the less scrupulous portion of the white population. By aid of the National Administration he combined these elements into a party which gained control of the State, stained its record ineffaceably with repudiation enactments, and sent Mahone himself to the United States Senate, where he offered his vote to either party which would give the best terms. That is the truth of Mahonism, and it is a lasting stain upon Northern Republicans that as a party they countenanced and encouraged it.

The riot in Cincinnati has, at all events, had the effect of stimulating the work of reforming the criminal procedure. The monstrous rule which enables the prisoner to exclude from his jury any one who has read about his crime in the newspapers, and has formed an opinion about it, has been abolished. The prisoner's twenty-three peremptory challenges have also been cut down to six, and the State's increased from two to four. In other words, the rights of the community in the prosecution of crime begin to be recognized. A blow should also be struck at technical objections. Most failures of justice occur through these. Judges ought not to be compelled to order new trials on points which the full bench does not consider to have any bearing on the merits of the case.

The rapidity with which "goelism," whether practised by mobs or individuals, affects manners, was curiously illustrated by the performances of a man in Cincinnati on Monday week, who tried in vain to catch a street car after dark. Failing to overtake it or to attract the attention of the conductor, he took out his revolver, and fired two shots at it. He probably reasoned somewhat in this way: "The management of these car companies has long been intolerable. They run too few cars, and their conductors are negligent and insolent. This fellow is not looking out for passengers as he ought to be, or he would have seen me. Complaining of him at the office, even if I knew his number, would do no good, for they are all thieves together. The courts, too, are corrupt and sluggish. I must therefore revoke the powers which I have delegated to the officials of this State and city for my protection, and must stop this car in the natural way in which cars were stopped by primeval man before states were founded." So bang, bang went his pistol. It is a pity, almost, that he should have been arrested before the conductor and the passengers had dissolved *their* connection with the State, and begun to pepper him in self-defence.

The proposal of the Secretary of the Treasury to meet the evil of undervaluation of goods by offering a fourth of the gross proceeds of the duties, fines, and penalties recovered to informers, will meet with the emphatic condemnation of everybody who remembers the working of this system in New York ten years ago, and who cares much either for commercial or official morality. The working of it as revealed by the Congressional investigation, both in the Dodge and other cases, was simply a national disgrace. Informing became a regular trade, and was pursued freely in order to extort money from the victims, either directly or by compelling them to employ certain lawyers, and Government officials met in conclave to divide the spoils wrung in this way from merchants of whose real innocence there was no reasonable doubt. Much of this money, too, undoubtedly went to swell the Republican campaign funds, just as the high salaries of the city officials help now to fill the treasury of the Democratic "halls." The whole system was, in fact, at every stage steeped in fraud and villany, and fostered the worst passions of human nature. A revival of it would be a step backward towards barbarism. The true remedy, the rational and enlightened one, for undervaluation is, as Mr. Hewitt pointed out a day or two ago, the substitution of specific for ad-valorem duties, or the lowering of ad valorem duties so as to make the profit of fraud not worth the risk.

The decline in wheat and in railway rates has not led to any marked increase in the export trade, but has stimulated the interior movement of grain very decidedly. The distribution of flour, wheat, corn, and oats from Chicago to points between that place and the seaboard has been large and continues active. This must lead to a very considerable revival in general trade in the near future, but its effects are not yet apparent. The demand for dry goods is still sluggish and fitful. The iron and coal trades have relapsed into stagnation. The promise of settled spring weather which was given early in the week was later frustrated by snow storms, tornadoes, and bleak winds. The week closes with a listless tone in all departments of trade. Even the shipment of $2,600,000 gold excited no remark, and the rates for money were not affected by it. Business at the Stock Exchange has hinged upon the report of an expected restoration of rates by the Trunk Line Pool. Diligent inquiry has failed to confirm the rumor. It is believed that the Erie Company made some efforts for an advance in rates, and ascertained that the New York Central was willing to coöperate, but that the Pennsylvania declined to accede to the proposal. The conditions which led to the reduction of rates being unchanged, there is obviously no reason for an advance. If the present rates are non-remunerative, any railroad is at liberty to decline the business. But an attempt to establish an advance within a week, or at most a fortnight, of the opening of lake navigation would be attended with almost certain failure.

The Union Club has had another row to deal with, and has suspended a member for five years for telling another he was a "coward and liar," or something of that kind. As usual, his friends are busily fighting against the sentence as too severe, and cite several cases where equally disorderly members got off with less punishment. It appears, from what they say, that one member, who used bad language to another a short time ago, got only three years; while another, who accused a member falsely of cheating at cards, was only sentenced for a similar term. The great Loubat-Turnbull case is still before the courts, and there are said to be several members whose way of life in the club keeps them constantly exposed to judicial pursuit before the Governing Committee. The public rumpus that all these Union Club scandals make, and their lamentably frequent recurrence, suggest the question whether there is not something radically defective in the club discipline. The penalties for drunkenness and disorder and quarrelling can hardly be severe enough, or inflicted frequently enough, or there would be fewer such cases. There must be a considerable number of members

whose walk and conversation make them distinctly unclubbable, and who ought to be watched in a lynx-eyed manner until an opportunity of getting rid of them offers itself. Suspension in such cases is no cure. A man who has to be excluded from a club of gentlemen, even for a week, for ruffianly behavior, surely ought never to have belonged to it, and suspension for three or five years is, accordingly, a little ridiculous. There are no degrees of gentlemanhood. A man is either a gentleman or he is not. If at the age of twenty-five he has not managed to become one, there is no use in giving him more time. It would be funny between individuals to tell a man, "You are such a foul-mouthed ruffian that I really cannot associate with you for one year from this date. Come to me on the first of April next, however, and all will be forgotten."

The *Tribune* on Sunday perpetrated a cruel joke at the expense of Mr. Matthew Arnold and also at the expense of the New York *Times* and the Boston *Advertiser*. It published what purported to be an essay from the pen of "Mr. Arnold" on the subject of Philistinism in Chicago, taken from the *Pall Mall Journal*. The article appeared in the *Tribune* of April 6, under date of London, April 5. It did not purport to have been cabled from London, yet it could not have reached New York in any other way if the date were correct. The essay was a fair caricature of Mr. Matthew Arnold's ideas, but its style was so widely different from his that no one familiar with his writings could have been deceived by it. The Boston *Advertiser* copies the article, prudently changing the *Pall Mall Journal* (there is no such paper) to *Pall Mall Gazette*, and inserting the prænomen "Matthew" after the word "Mr." The *Times* makes "Mr. Arnold's" solicitude for the reputation of "Obermann" in America the subject of burlesque. The *Tribune* has "got a rise" out of the *Times's* funny man, but it may be questioned whether the winnings of the game justify such a breach of good taste.

The conviction of Mr. Edmund Yates, of the London *World*, and his sentence to four months' imprisonment, is an exceedingly disagreeable thing for him, but the wonder is that it has not befallen him long ago, in spite of all precautions. The business of publishing social tittle-tattle in any community in which people are in the habit of resenting scandal in the courts, is always a dangerous one for an editor, for sometimes the most deadly bits of gossip are really the most innocent looking on the surface. What is called "society journalism," too, in England, is really kept going by people in society, who profess to be horrified by it. *Truth* and the *World* are largely supplied with their social gossip by gentlemen and ladies whom nobody suspects of it, and the temptation to them to stab an enemy must sometimes be overwhelming. In fact, the Yates misfortune is interesting mainly as an illustration of how the thing is done. The paragraph for which he is to go to jail was forwarded him by Lady Stradbroke, the young wife of a very old man, and doubtless had malice at the bottom of it, and yet it had every outward mark of authenticity. Moreover, Lady Stradbroke was in the habit of sending in these things and getting paid for them. She experienced the supreme bitterness, it is said, when the libel was first exposed and before its source was known, of hearing her husband say, at his own table, that the author of it ought to be "tarred and feathered." One result of the whole affair will, doubtless, be to take a good deal of the spice out of society journalism. Contributors will be badly scared, and editors made overcautious. There will be fewer paragraphs beginning: "What is this I hear about," etc.

Whatever may be the reasons moving the Government of Great Britain to recognize the sovereignty of Portugal over the mouth of the Congo and the regions adjacent thereto, they are not binding upon other Powers, and the ratification of the treaty seems more likely to bring up an international question than definitively to settle one. The ratification of the treaty by Parliament itself is uncertain, and the arguments brought against it by the Manchester Chamber of Commerce and other commercial bodies in the United Kingdom are of a kind to stir up opposition among all nations having, or expecting to have, commercial interests in the vast country discovered by Stanley and partially explored by DeBrazza. The Manchester protest contends that the declared object of the treaty, "to promote the development of commerce and civilization on the African continent," would be completely frustrated by putting the entrance of the Congo valley under the control of the greedy and unscrupulous cabal which constitutes the court of Lisbon. The proposed treaty is to remain in force ten years, at the end of which time the whole subject of rights, privileges, customs dues, transit dues, and commercial regulations of all kinds will come up for readjustment. But then Portugal will be in possession, and will hold advantages far greater than she now has, and will be in much better position to dictate terms than now. Her claims at the present time are based upon nothing but an alleged discovery made 300 years ago, which was not followed up by settlement and occupation, and which has, therefore, in the eyes of international law, been long since forfeited. This doctrine has been maintained by all English ministers, Whig and Tory, Liberal and Conservative, from 1853 to the present time, or until the pending treaty was concluded. What was good law for Great Britain during a period of thirty years is good law for other countries now. It may be assumed that no country which has any concern in the present or prospective trade of the Congo country will consider itself estopped from taking such measures as its interests demand, in consequence of any private understanding established between England and Portugal. But if Portugal takes possession, with the assent and concurrence of the first naval and commercial Power on the globe, she will probably remain in possession. It will not be worth while for France to dispute her claims; Germany has no interests to look after in that quarter; Belgium and Holland are not strong enough to do more than enter a protest.

The objections made by the Manchester Chamber of Commerce against the treaty are twofold: First, that commerce would be essentially strangled by Portuguese administration, in spite of all guarantees intended to secure its freedom; second, that Portugal has neither the energy, the means, nor the power to control effectively the large delta of the Congo and the native tribes. "Every move a trader makes in Portuguese possessions," says one of the greatest travellers and authorities on western Africa, "is checkmated by the extortionate demands of a host of needy officials, extracting 100 per cent. upon every article in the name of customs dues and fees." "The trade," he continues, "would soon be strangled, and the present lively movement of commerce would come to a dead halt. By her thirteen treaties with native chiefs on the Congo, by the millions of money she has already expended, by the professions she has always declared before the world that she will defend the natives, England is bound to support the natives against the possibility of this evil being established." The Manchester people affirm that this testimony accords with their own experience. It accords precisely with that of our late Consul in the Island of Madeira, Mr. Du Pont Syle, whose letter we published last week.

The confusion in Egypt, which has been seriously increased by the resignation of the one capable and respectable man left among the Egyptian politicians—Nubar Pasha—seems likely to result before long almost inevitably either in the evacuation of the country by the British, or the complete assumption of the government by British functionaries. Probably nothing staves this off now so much as Mr. Gladstone's shrinking—natural enough at his age, and in his present state of health—from new responsibilities. His heart is set on the reform in the franchise now before the House, and this probably accounts for the way in which affairs in Egypt are being allowed to drift. But they cannot drift much longer. The annexation, open or virtual, of Egypt is going to be very serious, from the difficulty of making the natives into soldiers. In India it has always been found possible, except in the case of the Bengalese, to make excellent soldiers out of the conquered population, but the Egyptian fellahs seem to defy all the professors of the military art to convert them into fighting men. They are probably the only genuine friends of peace in the world. Even Quakers fight if pressed too hard, but the fellah will die first.

There is probably too much importance attached to the occasional interruptions of communication with Khartum. The place is a thousand miles from Cairo by the river, and the river is beset by a more or less hostile force. But it must be remembered that this is probably the most irregular force, in the strict sense of the term, in the world. Some days it is probably large; other days it is small. Some days it is close to the river; other days it is away from it. Some days it is disposed to fight; other days it is lazy, or has gone home to attend to its private affairs.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, April 2, to TUESDAY, April 8, 1884, inclusive.]

DOMESTIC.

IN the Senate on Thursday the debate on the Blair Education Bill (which appropriated $105,000,000 for education within the States) was continued. Senator Pendleton (Dem., O.) opposed it because he could not find in the Constitution any authority for such a bill. At a Republican Senatorial caucus on that day several amendments proposed by the Caucus Committee were approved by the caucus. Chief among them were propositions to reduce the aggregate appropriation to between $70,000,000 and $80,000,000; to make the money available only upon requisitions by the States under certain restrictions as to accountability, and to require its distribution to counties according to population and illiteracy. Senator Bayard (Dem., Del.) spoke on Friday in opposition to the bill.

The Senate, after a long debate and many amendments, finally passed the Education Bill on Monday night. In its final shape it appropriates $77,000,000 to be distributed among the States in proportion to their illiteracy on the basis of the census of 1880, the payments of the money to extend over a series of eight years. The amount to be distributed the first year is $7,000,000; the second, $10,000,000; the third, $15,000,000; the sums then diminishing at the rate of $2,000,000 annually until the eighth year, when all appropriations shall cease.

The House passed the Indian Appropriation Bill on Friday.

By a vote of 119 yeas to 126 nays, the House on Monday refused to suspend the rules and pass the bill of Mr. Converse (Dem., Ohio) to restore the rates of duty on wool provided by the act of 1867. Eighty Republicans and thirty-eight Democrats voted in the affirmative, and twelve Republicans and one hundred and fourteen Democrats in the negative. The protectionist Democrats in the House are very much disappointed, and declare that the hopes of success for their party in Ohio have been destroyed.

The House Committee on Commerce on Monday authorized ex-Governor Long to present to the Committee on Ways and Means the bill allowing the free importation of foreign materials to be manufactured into articles for the construction, equipment, repairs, outfit, or provisions of American vessels employed in the foreign carrying trade. The aim of the bill is to remove the discriminations against the American manufacturers which exist under the law allowing manufactured articles for use in shipbuilding to come in free of duty, by placing raw materials for the same purpose on an equal footing.

The House Committee on Post-offices and Post-roads on Friday, by a vote of 8 to 2, resolved that it is inexpedient for the Government either to construct a postal telegraph or purchase any existing line of telegraph. The Senate Committee, by a vote of 4 to 3, agreed to report a Postal Telegraph Bill.

Governor Murray, of Utah, on Friday replied before the Springer Committee to the charges against him while he was Marshal in Kentucky. He attacked the character of his accusers vigorously, and made a detailed explanation of the charges, all of which, he said, were eight years old.

The Committee on Public Buildings and Grounds will present to the House a resolution which sets forth that whereas it has been specifically charged that the officers of the Government are in complicity with Brooklyn real-estate men in the matter of selecting a site for the Federal Building in Brooklyn, a thorough investigation into the matter is recommended.

Another Democratic House caucus has been called to consider a resolution requiring that the Morrison bill be recommited to the Committee, with instructions to report back, before the 10th of January next, a bill reducing the revenue, by abridgment of both customs and internal taxes, to the actual necessities of the Government.

Arrangements are making for a meeting of the prominent leaders of the Democratic party from all parts of the country at the Mount Vernon Hotel in Baltimore the latter part of this month, for the purpose of bringing about a reconciliation between the divided factions of the party upon a number of important matters concerning the Presidential campaign.

Members of all the political parties in Minnesota met on Wednesday in Minneapolis and organized a "Minnesota State Free Trade League." The constitution declares in favor of absolute free trade, and pledges the members to neither support nor vote for any candidate for Congress or for the Legislature who is not pledged to free trade. The membership includes some of the most prominent party men.

The following is the vote on Wednesday for Governor in Rhode Island: Bourne (Rep.), 15,903; Segar (Dem.), 9,599; scattering, 15.

Municipal elections were held in Ohio towns on Monday. The Republican ticket was elected in Cleveland by about 3,100 majority. The bulk of the German and Bohemian vote was cast for the Republicans. The Republicans are elated over the result, and claim that it assures Ohio for that party in October. In Cincinnati almost the entire Democratic ticket was elected by about 800 majority. There were large Republican gains in German wards. The Municipal Reform ticket received only 800 votes. Reports throughout the State show that the Republicans gained in most of the larger cities. Indiana towns showed decided Republican gains.

In the Senate at Albany, on Monday night, the bill applying the Civil-Service Law to all cities of 20,000 or over was discussed. An amendment exempting firemen from the operation of the bill was passed, 15 to 5; also one giving preference for employment in the civil service to honorably discharged Union soldiers and sailors, and exempting them from civil-service examination. As amended the bill was ordered to a third reading. The Anti-Oleomargarine Bill was passed on Tuesday, 25 to 4.

General Chalmers, of Mississippi, has written a letter advising the Greenbackers and Independents of his State to join the Republican party.

The bill requiring that in New York and Brooklyn all telegraph, telephone, and electric-light wires and cables be laid underground before November, 1885, was passed by the State Senate on Thursday. On Thursday Mr. Robb introduced a bill applying civil-service reform principles to the police of the cities of the State.

All of the Roosevelt city reform bills were ordered to a third reading by the Assembly on Wednesday.

Mr. Howe's bill extending to January 15, 1885, the time when the Prison Commission shall make a report on the prison-labor question, was passed by the Assembly on Thursday.

The N. Y. Superintendent of State Prisons, Mr. Baker, has sent a communication to the Senate with reference to the effect of abolishing contract labor. He takes strong ground against the act already passed, and argues that all other methods of employing prisoners that have been tried have failed to produce satisfactory results.

Cincinnati has regained its accustomed good order. The citizens are making efforts for better local government and administration of justice.

General Aguero and twenty filibusters secretly sailed from Key West for Cuba in the schooner *Shoters* on April 1. The revenue cutter *Dix* started in pursuit, but failed to overtake them.

The schooner *Shoters* arrived at Key West, Fla., from Cuba on Sunday night and was seized by the Collector of the Port. The negro in charge said that he was engaged to pilot the *Shoters* to Cape Florida, and that on rounding Port Taylor Aguero, with a drawn pistol, told him that he must take the party to the Cuban coast. On approaching near to Cardenas, Aguero directed the pilot to land. This was done. The pilot then put to sea, but before getting clear of the land he saw an extensive fire, and thinks the plantation buildings were burned. The negro's story is doubted.

The First National Bank of St. Albans, Vt., suspended on Tuesday. The deposits amount to $215,000, which it is probable will be paid in full. Unfortunate speculations of stockholders are believed to be the cause.

A destructive tornado visited parts of Ohio, Indiana, and North Carolina on April 1 and 2. Oakville, Ind., was entirely destroyed, and five persons were killed.

A combination of nearly all the barbed-wire manufacturers in this country has been formed to control the trade, to maintain remunerative prices, and, by having a common purchasing agent, to keep the prices for raw materials within proper bounds.

The will of Mrs. Anna Ottendorfer, which was filed in this city on Tuesday, disposes of property valued at about $3,000,000. There are a great many large bequests ranging from $5,000 to $25,000 to various charitable organizations of this city. The bulk of her estate is left to her husband and children.

FOREIGN.

The body of the Duke of Albany reached Cherbourg on Wednesday night, and was placed on board the royal yacht *Osborne*, which then sailed for England. It was landed at Portsmouth on Thursday with great ceremony. The body was borne to Windsor Castle from the station on Friday upon a gun carriage drawn by eight horses. A long procession followed. The Dean of Windsor awaited the procession at the entrance to the Memorial Chapel. The Seaforth Highlanders placed the coffin in the middle of the chapel. After a short religious service, the royal personages withdrew. A second funeral service was celebrated later. No one was present save the Queen, the Duchess of Albany, and the Dean of Windsor. The final services took place on Saturday morning at 11:30 o'clock at St. George's Chapel. The Queen and the Princess of Wales went from the castle through the deanery to the chapel. The Prince of Wales, the Crown Prince Frederick William of Prussia, and the other royal personages assembled in the Memorial Chapel and marched in procession to St. George's Chapel. The Prince of Wales followed the coffin as chief mourner. The Dean began the services as the coffin entered the door. After several anthems the coffin was lowered into the vault. Throughout the services the Queen wept bitterly.

Mr. Gladstone made a powerful speech in the House of Commons on Monday in support of the Franchise Bill. He said it was a good thing for the state that the largest number of capable citizens should possess the franchise. He defended the extension of the franchise in Ireland as an act of right and justice. The bill passed its second reading by a vote of 390 to 210.

After a thorough discussion on Friday, the Cabinet decided against formally establishing a protectorate over Egypt.

Mr. Gladstone said in the House of Commons on Thursday that Gordon could withdraw from Khartum whenever he wished, but that the time had not yet come to order him to return. In the evening Sir Stafford Northcote moved an adjournment to discuss the Government's Egyptian policy. Mr. Glad-

stone said the object of the Opposition was to consume the time of Parliament and hinder the Franchise Bill. The motion was lost.

The *Pall Mall Gazette* (Liberal) on Friday said: "Egyptian affairs are fast drifting into anarchy, and through anarchy to annexation or war—possibly both. England must undertake the administration of Egypt. This will be a terrific burden, but the country must shoulder it manfully." It then urged the Government to assist General Gordon to establish an independent state at Khartum under his sovereignty. Earl Granville announced in the House of Lords that the Government were not prepared to send a military expedition to Gordon's relief.

Nubar Pasha resigned on Sunday the Presidency of the Council of Egyptian Ministers, owing to discord with the English officials and the unsettled policy of England toward Egypt. The rest of the Ministers threatened to resign. The bureaux are in a state of anarchy.

Nubar Pasha on Monday evening consented to suspend his resignation from the Egyptian Ministry until the English Government gave its decision in regard to the relative powers of the Egyptian Ministers and the English officials. The Khedive is supporting Nubar Pasha's right to the supreme control of the administration, and has urged Sir Evelyn Baring, the British Minister, to assent to the dismissal of Mr. Clifford Lloyd from the post of Under-Secretary of the Interior. It is the opinion of European officials at Cairo that a mixed administration is no longer feasible.

Sir Evelyn Baring has been instructed to try to arrange the differences between Nubar Pasha and Clifford Lloyd. On the other hand, it was reported on Tuesday that Nubar denies that his resignation is due to any such differences. It was also reported on that day that the British Government had urged General Gordon to vacate Khartum.

A Suakim despatch on Wednesday said: "Osman Digna is actively resuming the offensive, now that the British forces have withdrawn. He is attempting to cut off the friendly tribes about Handub and Tamanieb from water. The Sheikh Mahmud Ali is opposing him. It is likely that the difficulty will result in a battle." General Graham doubted the truth of this despatch.

Osman Digna was reported on Monday to be near Tamanieb with 1,000 men and boys who were willing to fight.

The roads beyond Berber are blocked, being occupied by rebels. The tribes between Shendy and Khartum are in open rebellion, and it is feared Berber and Dongola will be invested in a short time. Nothing has been heard from General Gordon for a fortnight.

Major Hunter has returned to Aden, having visited Berbera and Zeila, points in the Somali Territory, on the south shore of the Gulf of Aden. There has been some doubt as to the feeling of the tribes inhabiting that section, but Hunter reports that he found them well disposed towards the Egypt Government, although agitated, as was natural, over the condition of affairs in the Sudan. There will be no danger of trouble, Major Hunter believes, so long as the British gunboat is allowed to remain in that vicinity.

A motion by Mr. Justin McCarthy, that the condition of the Irish magistracy is calculated to destroy confidence in the administration of justice, was defeated in the House of Commons on Friday by a vote of 106 to 59.

The recent sudden removal of the convict Irish Invincibles from Irish to English prisons is attributed to the discovery of a conspiracy to destroy the Mountjoy prison by the use of dynamite. The Invincibles in the prison were engaged in clandestine correspondence with conspirators outside. Letters were found in James Mullet's cell which disclosed the plot. The prison warders were to be bribed with money from O'Donovan Rossa's fund to convey an infernal machine into the prison. The story was denied by a Dublin correspondent of the London *Daily Telegraph*.

The police at Queenstown narrowly scrutinize the baggage of American passengers arriving on transatlantic steamers, in order to prevent the introduction of dynamite.

Mr. John Bright's health is improved.

The Secretary of the London Corn Exchange reports enormous stocks of wheat, barley, and maize in the waterside granaries of that city. Of wheat alone there are 454,000 quarters more than last year. Of oats, however, there are 108,000 quarters less.

Cambridge defeated Oxford easily in the annual boat race on the Thames on Monday. The day was unpropitious, and there were few spectators. The total victories now stand, Oxford 22, Cambridge 18; one dead heat in 1877.

Mr. Wilson Barrett, the actor, gave a brilliant supper and reception at the Langham Hotel, in London, on Wednesday evening, in honor of Mr. Lawrence Barrett, the American tragedian.

Mr. Edmund Yates, the editor of the London *World*, has been condemned to four months in prison for libelling the Earl of Lonsdale. The judgment has been respited pending an appeal upon a point of law. The origin of this libel suit was a paragraph in the London *World*, which, though it mentioned no names, unmistakably pointed to Lord Lonsdale as having eloped with a young lady of high social standing. Lord Lonsdale is married.

A fierce fire in Paternoster Row, London, on Wednesday night, endangered many of the publishing houses. The Religious Tract Society's building and the buildings adjacent were burned. The fire raged for four hours. About a dozen houses, mostly bookbinding and publishing establishments, were gutted. The famous old "Dolly's Chop-House" was destroyed. The heavy losses were covered by a large insurance.

The negotiations between England and Spain in regard to the proposed new commercial treaty are ended without agreement.

It was reported from Madrid on Tuesday that Mr. Foster, the United States Minister to Spain, had started for Washington to confer with his Government in regard to a basis for a definitive treaty of commerce between the United States and Spain. The despatch added: "It is absolutely necessary for Spain to improve if possible the material condition of Cuba. A formula may be found based on reciprocity, for the benefit of the Spanish colonies, without prejudice to Spain. The English West Indian colonies run a great risk of being shut out of the American markets."

The Berlin *North German Gazette* (Prince Bismarck's organ) on Monday said: "By his physician's advice, Prince Bismarck renounces the control of the affairs of the Prussian Government, but retains the direction of imperial affairs. In this capacity he occupies a personal and untransferable position of confidence toward foreign Powers. Besides, foreign affairs are free from the friction so greatly connected with home matters."

The German Bundesrath has unanimously rejected the proposal that a responsible ministry be instituted for the Empire.

Emmanuel Geibel, the German lyric poet, is dead at the age of sixty.

Professor Virchow, after a minute inquiry, has been able to authenticate only one case of trichinosis in Germany, which was of doubtful origin. No case was traced to the use of American pork.

Gustav Richter, the German painter, is dead, at the age of sixty-one. One of his most admirable works is entitled "Jesus Reviving the Daughter of Jairus," which was painted for the King of Prussia, and appeared at the Paris Salon of 1857.

Ignaz Kuranda, a well-known journalist, died in Vienna on Thursday at the age of seventy-three. For many years he edited the Vienna *Ostdeutsche Post*.

Herr Scheffler, the editor of the Anarchist paper, the *Radical*, who has been under arrest for some time at Pesth, confesses that he was present at the meeting of Anarchists in Vienna when the murders of Detective Bloch and Police Commissary Klubeck were planned.

It is semi-officially asserted in Paris that the French will enter China and collect an indemnity from the Canton native customs.

The French expedition has started for Hunghoa. General de Lisle's column will operate on the left bank of the Black River and General Negrier's column on the right bank. It is reported that Lionvinloc will command the defence of Hunghoa, where there are assembled 3,000 Black Flags and 12,000 Chinese troops. It is believed that Hunghoa will be attacked on April 11.

M. Patenôtre, the new French Minister to China, will start for Anam on April 11 to organize a French protectorate over Anam and Tonquin.

In the Italian Chamber of Deputies, Signor Mancini, Minister of Foreign Affairs, stated on Tuesday that the Government had no intention of modifying the decision of the Court of Cassation requiring the conversion of the real property of the Propaganda into Italian rentes.

Signor Mancini stated in the Chamber on Tuesday that the question of the free importation of works of art into America would soon be satisfactorily settled. He thanked the American Minister and the artists who had so materially furthered the result.

At the Vatican it is absolutely denied that the Pope has written to the Emperor of Austria on the subject of leaving Rome, although it is not improbable that he will eventually do so.

The Irish Bishops will convene in Rome in September. The purposes of the gathering are represented to be similar to those of the Convention of American Bishops in 1883.

The Rumanian Ministry on Tuesday tendered their resignations in consequence of the hostile vote of the Chamber of Deputies on the Premier's proposal to fix a date to commence debate on the revision of the Constitution.

The White Cross steamer *Daniel Steinmann*, from Antwerp, March 20th, for New York, was wrecked on Thursday night, about ten o'clock, during a thick fog and storm, upon shoals off Sambro Island, Nova Scotia. Five of the crew and two passengers managed to reach the island in a boat. The captain and a boy passenger clung to the rigging and were rescued by a boat from the island. The steamer had ninety passengers, five officers, and a crew of thirty-four men. All perished except those mentioned above, making the total loss of life 120. The *Steinmann* was a large new steamship with four masts. The captain's story is that he mistook the Sambro light for Chebucto light. He is severely criticised. Eleven bodies have been recovered. Divers were at work on Monday rescuing the cargo.

The steamer *Newcastle City*, from Halifax for Boston, struck on a shoal on Friday, but managed to get off considerably damaged. On Saturday morning it was necessary to run her ashore at McNab's Island. Steam tugs and schooners removed her cargo on Sunday.

The Police Magistrate at Toronto on Tuesday, in the legislative bribery-conspiracy case, decided that there was sufficient evidence to commit the four defendants, Wilkinson, Meek, Bunting, and Kirkland, to stand trial on the charge of conspiracy. During the reading of the decision Kirkland fainted and was carried from the room.

THE BLAINE BOOM.

A CORRESPONDENT, whose letter we print in another column, desires some explanation of what he considers the slighting or hostile references to Mr. James G. Blaine which so frequently appear in the *Nation*, and which he suspects must be, in some degree at least, the product of private malice. We think he is entitled, as are our readers generally, to some such explanation, and we shall proceed to make it cheerfully, starting, however, with the assertion that no editor or other person connected with the *Nation* in any capacity has, to our knowledge, had any difference, quarrel, or controversy with Mr. Blaine, or has ever received any injury from him whatever, or bears him any personal grudge. Whenever he is discussed in these columns he is discussed either as the holder of a public office, or as a candidate for a public office. Nor do we make any reference to his private affairs except when those affairs have, or appear to have, a direct and important relation to his character and claims as a public man. In fact, all our comments on him and his doings are due to the fact that we consider his reappearance as a candidate for the highest office in the Government, or any other, as an audacious proceeding, which can only be accounted for by supposing him to have an extraordinary and unwarrantable confidence in the popular forgetfulness. It is the duty of all those who do not wish to see the Republican party burdened during the canvass next summer with the hopeless task of whitewashing him, to set forth briefly, now that his boom is becoming so lively, the charges which he will have to answer before he can be elected to the Presidency. It would be lamentable indeed, and certainly disastrous, if the task prescribed for Republican journalists by the Convention should be not the discussion of great questions of public policy, like the tariff, or the civil service, or the railroads, or the currency, but laborious examinations of Mr. James G. Blaine's railroad transactions. We mean, as far as we are concerned, to avoid this, if we can, by taking up his railroad transactions now, before the bustle and excitement of the canvass begin.

The first of the charges is, that, in the spring session of Congress in 1869, a bill was before the House of Representatives which sought to renew a land grant to the Little Rock and Fort Smith Railroad of Arkansas, in which some of Mr. Blaine's friends were interested; that an attempt to defeat it by an amendment was made, and was on the point of being successful, and its promoters were in despair; that at this juncture, Mr. Blaine, being then Speaker of the House, sent a message to General Logan to make the point of order that the amendment was not germane to the purposes of the bill; that this point of order was accordingly raised and promptly sustained by Mr. Blaine as Speaker, and the bill was in this manner saved; that Mr. Blaine wrote at once to the promoters, calling attention to the service he had rendered them, and finally, after some negotiations, secured from them, as a reward for it, his appointment as selling agent of the bonds of the road, on commission, in Maine, and received a number of such bonds as his percentage; that the leading features of this transaction appeared in two letters of his afterward made public, dated respectively June 29 and October 4, 1869.

Second, that he asserted at first on the floor of the House, with the view of covering up this affair, that the Little Rock and Fort Smith Road "derived its life, franchise, and value wholly from the State," and not from Congress; whereas the evidence subsequently taken by the Congressional Committee disclosed the fact that the road derived the value on which these bonds were based from the act of Congress of which Mr. Blaine secured the passage, in the manner above described in 1869; that he asserted on the floor of the House that the bonds he received "were bought by him at precisely the same rate as others paid," whereas the evidence showed that the bonds came to him as commissions on sales, which he secured the opportunity of making through his aid given to the work in Congress, and that he solicited this agency, basing his request on the aid so given, and that he paid nothing whatever for the bonds, the consideration being his ruling as Speaker and his subsequent efforts to sell them. What he did with these bonds—seventy-five in number—is uncertain; but strong, though not conclusive, evidence was produced going to show that they were taken off his hands at a good price by the Union Pacific Railroad (through the instrumentality of one Caldwell), which then also was in trouble. The investigation on this point was never pushed home, owing to the sudden illness which overtook Mr. Blaine in 1876.

Third, that Mr. Blaine in 1870 made an offer, as appeared by his own letters, to one of his railroad friends, Mr. Warren Fisher, of Boston, to sell him a half of one twenty-fourth interest in the Northern Pacific Railroad, immediately after Jay Cooke's contract "had been perfected, and the additional legislation had been obtained," he having, he said, come into control of this interest "by a strange revolution of circumstances"; that the amount of stock which this would represent, he said, would be $425,000, and the number of acres of land "nearly 275,000." "The chance," he said, "was a very rare one; he couldn't touch it," but he offered it to Mr. Fisher for $25,000; that Mr. Fisher accepted it, and paid the money, but for some unexplained reason the stock was never delivered, and Mr. Blaine subsequently returned the amount. This transaction was a very peculiar one for the following reasons:

It appears from acts of Congress relating to the road, none of which are of older date than July 2, 1864, that the authorized stock was $100,000,000, with a land grant, estimated by the Commissioners of Public Lands at 47,000,000 acres, or 74,423 square miles. The line of the road was 2,000 miles long; and at the time of Blaine's letter to Fisher, it was, he says, being built on bonds at $25,000 a mile, which would have made a bonded debt of $50,000,000. Mr. Blaine, as member of Congress and Speaker of the House, must be taken to have known about the circumstances of the road, and, therefore, there seems no escape from the conclusion that his offer was based on the expectation that he would receive almost as a gift a share in an enterprise dependent for its value on legislation in which he had taken part. Mr. Blaine's defence in the case of this transaction consisted at first of a denial that he had ever had any transaction with the road at all, but he afterwards rested on the fact that he had no pecuniary interest in the transfer, and that it was never actually made; yet, though this might be a defence to suit against him for a conspiracy to defraud purchasers of the stock, it does not affect in any way the nature of the offer. His relations with Warren Fisher were, in 1870, as appeared from the evidence, such that any favor done the latter, or gift presented to him, had a direct pecuniary value.

Fourth, that he obtained certain letters, which there is every reason to believe contained matter gravely compromising him, from a perfectly reputable witness, Mr. Mulligan, who was the proper and lawful custodian of them, after having vainly tried appeals to his pity, by pledging his word of honor to restore them, then broke this pledge, retained them by force, and subsequently read such of them as he pleased to the House in aid of his vindication; that this conduct, if not legally criminal, was such as no man aspiring to be the chief magistrate of a great nation ought to be even suspected of.

Fifth, that both his short service as an executive officer of the Government, and the various efforts he has made during the past eight years to keep the public in mind of him, have been sensational and theatrical, indicating a strong love of notoriety and an absence of the settled convictions, the sober judgment, and the steadiness of character which are needed to make him a safe occupant of any high or responsible administrative office; and that the means by which his booms are started and promoted, of which the manner in which his 'History' has recently been heralded and produced is a good example, bear too close an approach to the advertising devices of a circus or other public show, to make the candidacy of any person resorting to them anything but a humiliation for the party producing him.

Lastly, it seems to us emphatically the duty of the independent voters to repress in some signal way the rapidly growing practice of packing conventions under the personal superintendence of candidates for the Presidency. It is of comparatively recent date. It is only a very years since Mr. Tilden excited the horror of the Republican press by taking charge of his own canvass, and starting a "literary bureau" to supply puffs of himself to the newspapers. Since then it has grown apace, and it now excites no surprise to hear that any candidate is actively engaged in using all his powers of intrigue, chicane, and corruption to secure the election of delegates all over the Union, pledged either openly or secretly to act under his orders at the Convention, and, if casting votes for him will do do no good, to cast them in such a way as to enable him to carry out any bargain or "deal" with any other candidate which it may have pleased him to make. The nominating Convention has already, through its size, as well as for other reasons, lost nearly all semblance of a deliberative body,

but it has not yet become wholly the product of "subsoiling" carried on by the various candidates themselves. In this art of packing conventions Mr. Blaine is now the greatest master in the country. His success would make this art almost the only one which American statesmen would hereafter cultivate, or would apparently need to cultivate. It is high time, therefore, that he and his disciples were made to understand that it is not by such little games that the Presidency is to be won.

ANOTHER "ANTI-MONOPOLY" DECISION.

SINCE the decision in the Granger cases, no more important questions relating to corporate property and charters have been before the Supreme Court of the United States than those involved in the Spring Valley Water Works case, recently decided. The material facts are as follows: The old Constitution of California provided that all laws relating to corporations might be from time to time "altered" or "repealed" (Const. Cal. 1849, Art. iv., Sec. 31). After the adoption of this Constitution various acts were passed by the Legislature authorizing the formation of water companies, and providing that the rates for water should be fixed by the municipal authorities of the cities and towns supplied. Under these laws, however, no supply of water was provided for San Francisco, owing, it may fairly be presumed, to the fact that no one cared to spend money for such an enterprise, if the price of the water was to be fixed by the people who used it. At any rate, in April, 1858, the city of San Francisco being in great need of water, an act was passed authorizing the formation of water companies, which differed from all preceding acts in the circumstance that the rates were to be determined by a board of commissioners, of whom two were to be chosen by the town authorities and two by the company; and, in case of a disagreement among the four, a fifth person was to be selected either by them or by the Sheriff, the object of this machinery being to secure an impartial decision. Shortly after the passage of the act the Spring Valley Water Works Company was formed under it, and has since that time spent a large amount of money in the erection of substantial and extensive works for the supply of San Francisco with water, the value of which depends of course entirely on the rates at which the water is taken. For twenty years these rates were determined by the board selected in the manner we have described. In 1878 a vacancy occurred, by the death of one of the Commissioners, which has never been filled.

In 1879 the State adopted the Sand Lot Constitution, which attracted so much attention at the time as the first confessedly communistic Constitution ever adopted in the United States. Article xiv., Sections 1 and 2, of this body of law is devoted to "Water and Water Rights," and provides that the rates for water used by any city or town shall be fixed from year to year by the municipal authorities. Under this provision the San Francisco Supervisors claimed the right to fix the rates to be charged for water by the Spring Valley Company, and refused to appoint a commissioner to fill the vacancy in the board. The decision of the State Supreme Court was that the new Constitution abrogated the law of 1858, and this decision has now been affirmed at Washington.

The question involved in the suit, it will be seen, turned wholly on the power of the Legislature to alter and amend corporate charters. The Spring Valley Company maintained that it had, under the law of 1858, a right to the maintenance of the Commission for fixing rates. The city claimed the right to substitute for it a commission consisting of its own Supervisors. The fact that the change in the law had been made by a constitutional amendment was of no consequence; it might have been made by the Legislature just as well. Either under the Dartmouth College case the charter was inviolable, or else, under the power to alter and amend, the change was valid.

It was urged in behalf of the company that letting officers elected by the buyers of the water determine the prices which should be paid for it, was a violation of the principle that no man shall be a judge in his own case. The Court says in reply to this, that the Granger cases (Munn *vs.* Illinois, 94 U. S., 113), decided that "it is within the power of the Government to regulate the prices at which water shall be sold by one who enjoys a virtual monopoly of the sales." It was also argued that as the laws before that of 1858 for the formation of water companies, which provided that the rates should be fixed by the town authorities, were not accepted by the Spring Valley Company, and that of 1858, with a provision for a board of arbitrators, was accepted, it is to be inferred that the State contracted with this company not to subject it to such one-sided machinery. But the Court in reply to this lays down the following proposition:

"The Constitution of California adopted in 1849 prohibited one Legislature bargaining away the power of succeeding Legislatures to control the administration of the affairs of a private corporation formed under the laws of the State. Of this legislative disability, the Spring Valley Company had notice when it accepted the privileges of the act of 1858, and it must be presumed to have built its works and expended its moneys in the hope that neither a succeeding Legislature, nor the people in their collective capacity when framing a Constitution, would ever deem it expedient to return to the old mode of fixing rates, rather than on any want of power to do so, if found desirable."

It seems, therefore, to follow from this and the Granger cases that in any State which has the power to alter and amend charters, first, the Dartmouth College case does not apply, for a charter with which one of the parties to it can do what it pleases, cannot be a "contract" in the ordinary sense of the term; and second, that all that capital seeking investment, in such States has to rely upon is not the restraining power of the courts, and the clause of the Constitution relating to the "obligation of contracts," but "a hope" that the Legislature may not change its mind. Can the Supreme Court really wish to have it supposed all over the world that the power to alter and amend charters makes corporate property less secure than individual property, and that every American Legislature reserving the power to alter or amend charters can alter the value of corporate property at discretion?

CLUBS IN COURT.

THE Loubat case, and a number of other recent club disputes which have been made more or less public, have drawn attention to club law and discipline, and promise to have an important influence in the development of club life in New York. Until within a few years club members who for any reason have been expelled from clubs, have generally refrained from taking their cases into court, partly, no doubt, because the nature of club quarrels is generally such that, in the full glare of publicity, they are apt to bring a good deal of ridicule and contempt on those engaged in them; partly because a man is very seldom expelled without good reason, and he, more than any one else, shrinks from inquiry into the facts; and partly also because to a man with whom his fellow-members do not desire to associate, a club is of very little use. All clubs guard themselves against having such members by providing that a few black-balls shall exclude a candidate from admission; and a member expelled for conduct which makes him disliked is obviously a more "unclubbable" man than most candidates who fall short of getting the requisite support for admission. Under ordinary circumstances the position of a club member reinstated by order of court must be anomalous and, in fact, almost absurd. From the way in which club quarrels now get into the newspapers it seems as if this dislike of publicity must be dying out, and as if a feeling were growing up that a court of justice were the proper and legitimate forum for the settlement of all such matters. The matter possesses a good deal of importance in New York, where a lawsuit of this nature may be protracted for years so as to involve both sides in enormous expense.

Most of the little law in existence relating to clubs is English, London being the great modern headquarters of club life, and the English courts have in the last few years had to pass upon several club expulsion cases. In two of these, members were reinstated. Both were decided by the same judge—Sir George Jessel—and explain very clearly the limits within which courts will interfere in matters of this kind.

In Fisher *vs.* Keane (L. R. 11 Ch. D. 353), the plaintiff, while engaged in a game of pool (one of the players being a guest of another member), got into a dispute as to his own sobriety. He was, as a matter of fact, intoxicated, but nevertheless became extremely angry at the fact being urged upon him by the guest, who appears to have been a man of little tact, as a reason for getting through the game quickly. He retorted by calling the guest a liar, on which the game was stopped and his conduct reported. By the rules of the Club, the Governing Committee, when "specially summoned for that purpose," could, by a unanimous vote, expel for conduct "injurious to the character and interests of the Club." The Committee at a meeting not called for the purpose, and by a vote which was not unanimous, expelled the plaintiff, and this too

without any notice to him, and without giving him any opportunity to be heard. Sir George Jessel reinstated him, both because the rules had been violated, and because the "ordinary principles of justice" had been violated in not giving him a hearing.

The case of Labouchere *vs.* the Earl of Wharncliffe was decided on much the same grounds. Mr. Labouchere, the editor of *Truth*, was assaulted by Mr. Levy Lawson, a fellow-member of the Beefsteak Club, just outside the club house. Mr. Levy Lawson then went into the club, followed by Mr. Labouchere, and in the latter's hearing stated that he had just thrashed the editor outside. Mr. Labouchere wrote to the Committee complaining of this, and of Mr. Lawson's having used the club for the purpose of an "ambush," and of another member for having helped his assailant. The Committee thereupon notified Mr. Labouchere that a special meeting would be called to consider the case, and meantime that he must enter into an engagement not to attack any fellow-member in "any publication." The rules of the club provide that for any conduct, in the opinion of the Committee, "injurious to the welfare and interests of the club," the Committee may call upon a member to resign, and, if he refuses, they are to call a general meeting, which may expel by the vote of "two-thirds of those present." In this case the Committee decided to call upon both parties to the quarrel to resign. Mr. Lawson did so. Mr. Labouchere refused, for a variety of reasons, among others the rather amusing one that the club was attempting to establish a "press censorship." A meeting of the club was accordingly called, and Mr. Labouchere expelled by a vote of 77 to 38. There were, however, 117 members present. Sir George Jessel reinstated Mr. Labouchere on the ground that the rule requiring a two-thirds vote of those present had been violated, and also that there had been no proper inquiry by the Committee, no preferment of a definite charge, and no notice, no taking of evidence, no hearing, and not even any clear statement of the cause of expulsion.

These cases go no further than deciding that a court of justice will interfere to make a club conform to its own rules, and that it is part of the unwritten law of every club that a member shall not be expelled without a fair hearing of what he may have to say in his defence, and a fair inquiry into the facts by the club tribunal. But this does not mean, as might at first sight be supposed, the sort of hearing that a defendant would have in court. Club committees are not courts, and they do not administer justice, but social discipline, and the object of their existence is not to decide which of two parties to a club quarrel is in the wrong, but to prevent the club from becoming a bear-garden, as any club must become in which members are allowed to quarrel, to get up parties, and to publish "charges" against each other. In every case of conduct supposed to be injurious to the interests of the club, the club itself is the aggrieved party, and at the same time the judge and prosecutor. This has to be so from the nature of the case, unless the members are so fond of litigation that they prefer to have the affairs of the club administered in the judicial way — something which no club rules ever contemplate.

The fact is, that the very worst plight a club can get into is when its discipline has to be overhauled by a judge, and the English judges have shrunk from the task, except in such extreme cases as those we have cited, when it has been forced upon them by the stupidity of the managers themselves. Of the thousand little details of conduct and behavior which may be injurious to the character and interests of a club, nobody but the club can properly judge, and, on the other hand, club privileges which have to be enforced by a sheriff are of no value to any one. Indeed, it may be gravely doubted whether the mere fact of taking his case into court would not in most cases warrant a committee in deeming a club member's conduct prejudicial to the interests of the club, though this precise question has not, we believe, yet arisen.

THE UNIVERSITY OF EDINBURGH.

On the seventeenth day of April, the University of Edinburgh is to celebrate the three-hundredth anniversary of its foundation. Invitations have been sent to the principal universities and colleges of the world to participate in the festivities, and among the scholars thus assembled there will be several representative Americans. In view of the event, the Principal of the University, Sir Alexander Grant (well known as the editor of the 'Ethics' of Aristotle, and for his services in the promotion of education in India), has prepared a history of the foundation, which has lately been published in two large octavo volumes, with numerous portraits and other illustrations. The record may appear to be a thrice-told tale. Crawford, who died in 1662, left behind him manuscript annals which were printed in 1808. Dalzel, another professor, who died in 1805, likewise left incomplete materials for a history which were edited and published in 1862. Alexander Bower published two volumes in 1817 and a third in 1830, which brought the story down to the date of his publication. But all these essays were very defective; only in the work of Sir Alexander Grant have we a satisfactory narrative of the growth of the University. Notwithstanding the author's apology for "the pressure" under which he prepared this "birthday offering," his work is admirably comprehensive and instructive. For reasons which we shall presently point out, it is of special interest to Americans.

In order to set forth the distinctive character of the University of Edinburgh, the historian first gives an account of the three Universities, St. Andrews, Aberdeen, and Glasgow, previously established in Scotland, all in the fifteenth century, upon an ecclesiastical basis which even the Reformation could not obliterate. Quoting Bulæus, who said, in his 'History of the University of Paris,' that "a University without privileges is like a body without a soul," Grant shows that "founding an University" in those days was "something more than merely establishing a school with various branches of teaching: it was, in truth, setting up a little state within the state." The taking of a degree was "not a mere distinction to be obtained by a youth; it was a license to teach, not to be lightly conceded, but only awarded after full scrutiny, conducted in the most solemn way, by the highest authorities." With the reformation of the Church came neglect of University forms, and, as many have thought, decadence of University spirit. Universities, as distinct from colleges, had no life. Therefore, as in St. Andrews, Aberdeen, and Glasgow the colleges had taken the place of universities, the University of Edinburgh was founded in the form of a college. In a paper of Queen Mary's, dated in 1563, Grant found a phrase—"our college and university"—which he mentions as perhaps the first instance on record of a college being identified with an university.

Some obscurity rests over the earliest history of the Edinburgh foundation, but a positive date is reached, April 14, 1582, when King James VI. signed a charter giving power to the Town Council of Edinburgh to provide for higher education, in humanity and the tongues, in philosophy, theology, medicine, law, and other liberal sciences. Thus, says Grant, "the municipal authorities and clergy of Edinburgh were entrusted forever with the absolute control of higher education within the burgh." For this novel arrangement there was one precedent, the Academy of Geneva, a modern and Protestant foundation, where from 1569 to 1574 Andrew Melville, the illustrious Scotch reformer and scholar, had been for several years a professor of humanity. On the 16th of October, 1583, the Magistrates of Edinburgh appointed a committee to devise the order of teaching to be kept in the college now erected. Wisely, as three centuries have proved, a course of strictly university study was adopted. The curriculum was divided into four sessions, in the third of which students were called determinands or bachelors; in the fourth, magistrands, because they were about to be made magistri, or masters of arts. The prescribed course differed from the mediæval degree system, says Grant, first, by making Greek an indispensable part of university study; second, by the spirit of humanism which it exhibited, great attention being paid to purity of style in Latin and Greek; and third, by its modernizing tendency, shown in the admission of the Dialectics of Ramus, the Rhetoric of Talæus, Hunter's Cosmography and Descriptive Anatomy. Instruction began in the winter of 1583–84.

We have already intimated that there are several reasons why this history is of peculiar interest to Americans. It is a limited history, having a formal and definite opening three centuries ago, not lost in mysterious mediæval conventual life, like that of the Universities of Oxford, Cambridge, and Paris, and of other institutions on the Continent. Moreover, it is the life of a Protestant University. The other three foundations of Scotland were established by papal bulls, and were based on the theory that they were parts of a great commonwealth of scholars, in which the Pope of Rome was the governor and head; but Edinburgh has no such Roman Catholic background for its annals. Again, it is emphatically a civil foundation, deriving its authority nominally from the Crown, and, in fact, maintained by the financial and official support of the Town Council. Once more, it is, like Harvard and Yale, an example of a college grown into a university. Often, in its nomenclature, the words college and university have been used indiscriminately, and its own alumni, like many American graduates, have confounded the two designations as if they did not know any difference of function. Besides all this, Americans for more than a hundred years have turned to Edinburgh for inspiration and instruction in science, in philosophy, in literature, in theology, and, most of all, perhaps, in medicine. Almost all the earliest professors of medicine in this country (as Dr. N. S. Davis has pointed out) were graduates of Edinburgh, and their Scotch alma mater was the model on which they formed the new medical institutions of this country. Four professors in the earliest of these colleges, at Philadelphia—Drs.

Morgan, Shippen, Kuhn, and Rush—had all been graduated doctors of medicine at Edinburgh prior to 1768. Doctors Bard and Mott, and we think Doctor Hosack, of the College of Physicians and Surgeons in New York, were likewise Edinburgh students. At the instance of Benjamin Franklin, the honorary degree of doctor in divinity was bestowed on Ezra Stiles, as far back as 1765, while he was a pastor at Newport, several years before he became President of Yale College. The like honor was subsequently given to Rev. Samuel Cooper (1767), Rev. John Lathrop (1785), and Rev. Chandler Robbins (1792). Early in this century, Benjamin Silliman went to Edinburgh to fit himself for a professorship of natural science, and there attended the lectures of Hope, Gregory, Murray, and Barclay. Two young graduates of Harvard, Rev. John Codman and Dr. John Gorham, were there his companions, and he mentions in his diary that about thirty of his countrymen, chiefly Southerners, were also attending lectures. At a later day, John P. Norton, the first American professor of agricultural chemistry, prepared himself in Edinburgh for scientific work. The philosophical writings of Dugald Stewart, Thomas Reid, and Sir William Hamilton long held their ascendancy in American colleges.

From its foundation onward, Edinburgh has been growing in honor and usefulness. Long ago it was called the Modern Athens. Stuart, the author of the 'Antiquities of Greece,' is said to have suggested this epithet because of the resemblance in the aspects of the two cities, and perhaps this circumstance has had its influence upon the architecture of Edinburgh. But certainly the spirit of Athens does not require for its embodiment an acropolis or a temple. Leyden is flat, and its buildings are tame, but its University is a worthy peer of its Edinburgh contemporary. We must look beyond the natural or the structural advantages of a city if we would determine the conditions of academic success. It would be an interesting inquiry what then made the youngest university of Scotland surpass its elders—what secured its position.

In addition to the work of Sir Alexander Grant, there are many volumes which throw light upon the character of the University. Among those which we recall with most pleasure is the Life of Edward Forbes, the naturalist, in which there are charming pictures of academic life. An institution which can claim Goldsmith, Walter Scott, Carlyle, and Darwin among its alumni, and can say that Niebuhr came from Germany to spend a year within its walls, is of no mean repute. It is pleasant to notice that in its three-hundredth year the number of students is greater than ever before, having reached an aggregate of 3,341, more than half of whom are in the medical department. Nearly one-third are in the department of arts, while the rest are jurists and theologians.

BISMARCK'S MEASURES BEFORE THE REICHSTAG.

BERLIN, March 24.

SINCE March 6 the Reichstag has been in session again. A few days after its constitution Bismarck returned to town, and took an active part in the proceedings. He has spoken on several occasions with an irritation which affords no good prospect for the peaceful settlement of affairs. The Chancellor looks much better than before, has grown thinner, and lost, as he says, a roebuck's weight, and seems to be more nervous than ever. His addresses are rather garrulous, going over old stories and old charges again and again, and treating his political opponents with a bitterness and disdain as if they were his personal enemies. Contrary to his former custom, Bismarck punctually made his first appearance at the session of March 13, and delivered a long speech, in which he tried to justify his course in relation to the Lasker resolutions passed by your House of Representatives. When he rose, not twenty members were in their seats; but he nevertheless went on, and soon a very attentive audience had gathered before him. In the beginning he made a kind of apology to your Congress, and gave a retrospective review of the old friendly relations existing between the United States and Prussia. He then called the resolutions an act of respect and good-will to the German Empire, which methodical opposition at home had tried to utilize for party purposes against his own person. I need not remark that the Chancellor's supposition that German members of the Reichstag were the originators of the American resolutions is wholly unfounded. "He who praises Lasker vilifies me and the Imperial (*i. e.*, Bismarckian) policy," is the gist of his whole reasoning. His organs, let loose like hounds eager for prey, echo these charges in all modulations, and call the suspected deputies who signed the harmless address of thanks to the House of Representatives and Mr. Schurz (Messrs. v. Forckenbeck, Bamberger, Kapp, Rickert, Bunsen, and Schrader) traitors to their country and paid tools of a foreign Government. At the same time the Chancellor begged the House to avoid all personal attacks, and to transact all business in a gentlemanly manner. As in his speeches, so in his writings. The other day he sent an answer to some 169 working and "practical" men at Margrabowa (a little town in western Prussia, as important, for instance, as Buncombe), who had declared themselves in favor of his policy, asserting that the German originators of the American resolutions had usuriously availed themselves of the death of Lasker to attack the Imperial policy by suggesting them. You, who know the facility with which such resolutions are introduced and carried in your legislative bodies, are a much better judge of this frivolous insinuation than I am. Too much, however, has already been said about this Lasker affair, and it is to be hoped that the tact manifested at Washington in burying it decently will have made an end of all further animosities and troubles.

Last week the Reichstag discussed and referred to special committees two important bills. The one was the law of insurance against accident to the workingmen of the different trades, and the other the further prolongation of the exceptional law against the Social Democrats. In former sessions the first has twice been rejected on account of its imperfections. It has a rather sentimental motive, as, in the words of Bismarck himself, the Administration does not want to profit by accidents and calamities. In its present shape the bill is rather worse than better, as the Chancellor's most highly trained coöperator has withdrawn, for the reason that the plan, if carried out, would lead to bankruptcy and ruin. Two young *Streber* (strivers) have taken up this job, and, in a few days, presented a new scheme, for which the younger of them was, of course, promoted at once. To benefit those who *must* insure themselves in institutions to be created by the Government, the bill proposes to do away with all private insurance companies, thus jeopardizing several hundreds of millions invested by the working classes and leading to the ruin of thousands. The bill in itself is of little consequence. It proposes to saddle the employers of our manufacturing establishments and trades with five millions of marks, in favor of their employees when injured in the performance of their duties. There is no dispute about the burden itself, or its bearers, but more about the ways and means—how it is to be borne. This *how* has occupied the legislative power for years, and has led to the most passionate debates. The representatives of individualism try to attain the end in the same way in which all other similar schemes are realized under our present political and social organization. They further propose to fix by law the duty of employers to make whole their employees who have been injured in their service, and to treat this duty like any other civil obligation. Instead of this, which meets with no objection, we are confronted with a socialistic measure of the greatest consequence, which is intended by Bismarck to be a masterpiece of modern state socialism. An Imperial Insurance Board is to be created with almost unlimited powers, with branch offices acting under the central establishment, and the whole manufacturing interest is pressed into the scheme. The workingmen themselves, in whose interest it is pretended that the contest is carried on, are utterly indifferent to the proposed plans, a fact which proves that the real object of the measure lies in another field. Bismarck tries to make political capital by socialistic experiments; but he finds no credence among the men whom he wishes to benefit.

What are we coming to if a highly respectable business like insurance is accused of being immoral? Is it disgraceful if a business flourishes? Is it a shame that important services rendered to the public yield some profit? Does the farmer who raises corn or wheat do it for God's sake? For appeasing the hunger of poor people, is he not entitled to at least his own living and some gain besides? Is it really revolting that the baker who bakes bread looks to his own profit also? The more general and urgent a want is, the providing for which is the basis of a man's business, the lower he stands, according to Bismarck's appreciation, in the ethical scale. To the farmer and baker succeed the weaver and tailor, the tanner and shoemaker, the architect and the house-owner. Next come physicians, who are so impudent as to make a living by curing their suffering brethren; and teachers, who make the ignorance of the child the basis of operations for their pay. If, however, it should happen that at the top of this Bismarckian ladder of morality stood a queer fellow who devoted his time and money to the manufacture of things which were of no use to any one, who therefore worked for no human need—him the new sentimental economy would feel bound to proclaim the most virtuous. You see we are approaching more and more the apostolic age—we are growing more angelic every day; and it will not be long before all business will be conducted on strictly evangelical principles.

In the opinion of the Reichstag's tribunes, three things are necessary to a general discussion in grand style, viz.: a three-days' debate; one, if not two, speeches from Bismarck; and speechifying full of personal repartee and animosities, with but few or no real facts. At the discussion of the further extension of the anti-Socialistic exceptional law, none of these three characteristics were wanting. The debate occupied some twelve hours. Bismarck spoke at some length, but very irrelevantly; and his man Friday, Minister Puttkamer, confined himself to reading commonplace extracts from Socialistic pamphlets and manifestoes, beginning with Fourier and ending with Lassalle and Bebel, in order to prove the dangers threatening us from Socialistic propaganda. The measures, however, thus far taken have rather strengthened than weakened that sect. Bismarck likes, and has always liked, to have several strings to his

bow. In the present emergency it is much easier to have more arbitrary weapons, and to use them when he sees fit. Last fall, at the elections for the Berlin city representation, the exceptional law was set aside, and the Social Democrats, together with the anti-Semitic followers of Stoecker, were let loose on the "bourgeoisie." It was, of course, an innocent aristocratic sport!

The debate itself brought no new arguments. The real interest lay elsewhere. Bismarck had threatened to dissolve the Reichstag if it should dare to give a majority against the bill. He wanted to have the vote taken at once; but, instead of complying with his wish, the Reichstag referred the bill to a committee, which will require at least a month or more before it will be able to report. The Conservatives and National Liberals are in favor of Bismarck's plan; the Liberals are against it, and the Centre still stands uncommitted. The fate of the bill therefore depends on the vote of the Catholics. They want to make a bargain with the Chancellor. If he reinstates the Archbishop of Cologne—Ledochowsky of Posen is out of the question—or makes some other compromise satisfactory to them, they will of course vote for his pet measure. For the present they, as little as the other parties, are prepared for the new elections, and for this reason all the opponents of the bill have preferred to preserve the present Reichstag until after the holidays. In the meantime, something favorable may turn up for the Centre. If so, they will of course come to terms with Bismarck and save the bill; if not, the latter will be defeated and the Reichstag dissolved.

Another important political event of this month is the formation of the new Liberal party, composed of the former Liberal Union (so-called Secessionists) and of the late Party of Progress. Out of 397 members of the Reichstag it numbers just 100, and has all the elements of power and efficiency. This is a practical step in the right direction toward reconciling old minor differences and marching in one line against the united attacks of the Conservatives. The new party calls itself the German Liberal party. Its platform, embodying the just demands of the middle classes, can and will be endorsed by any liberal man. Thus far the National Liberals, who have dwindled down to forty members, have held aloof from their former brethren. In my opinion, they will be swept away by the next elections, and the larger part of them, led by political affinities, will go over to the Conservatives, while the smaller part will amalgamate with the new party. The Conservatives look at the latter with undisguised spite and hatred, for the reason that a united opposition will be a more dangerous foe to them than two or three split factions. The Conservative papers attack the new party with bitter vehemence, and are joined in their Samaritan work of backbiting and slandering by the Liberal milk-and-water organs like the *Kölnische Zeitung*. If the German Liberals had not known what their own interest was, the animosities of their adversaries would have taught them that they were on the right track. Their vote, although not yet decisive, in many cases will hold the balance of power. Besides their 100 members, the Conservatives number 74, the Ultramontanes 97, the National Liberals 40, the Poles, Alsace-Lorrainers, and Social Democrats each 15, the People's Party 10, the Guelphs 10, and the *Wilde* or Savages (belonging to no party) about 20 of the present House. To judge from present appearances, the next elections will turn out in favor of the German Liberal party. † † †

Correspondence.

A BLAINE INQUIRY.

To the Editor of The Nation:

Sir: At least two constant and admiring readers of the *Nation* feel regret at the tone of that journal in its treatment of Mr. Blaine—a tone which it employs toward no other prominent man. This regret is not caused by admiration for the ex-Secretary, nor by sympathy with whatever political aspirations he may cherish, for we have neither to any unusual degree. It arises, however, from the fear that the keenly satirical paragraphs in regard to Mr. Blaine's posing as a Presidential candidate are as much the result of personal feeling on the part of the editor, as of a real desire to expose what he considers the shallow tricks of a chronic Presidential candidate; and if this fear is justified, the regret is also justified, for we are jealous of the good name the *Nation* has gained.

In every mention made by the *Nation* of Mr. Blaine, whether in the discussion of his South American policy, his history, or his letter in favor of distributing the surplus revenue among the States, the same sign of dislike, of unconcealed bitterness, of unwillingness to make any acknowledgment of possible disinterested motives on his part, is plainly discernible.

Now, while there is honest difference of opinion in regard to Mr. Blaine's rank as a statesman, and while it may be honestly believed that he is planning to capture the Republican nomination for President, is it fair to presume that he is less patriotic, and that he carries into his actions and methods less disinterestedness, than do other public men? Why single him out as a person whose every action and utterance that happens to be told in print is to be twisted into evidence of his ambition and only another move in his campaign for the Presidency?

Cannot the several gentlemen who are mentioned as possible candidates for the Presidency be treated in the same way with equal justice? Cannot they all be accused of instigating the many newspaper articles that advocate their claims, and who can disprove such statements? What proof has the *Nation* that Mr. Blaine is acting before the American people, and is more designing than President Arthur, Secretary Lincoln, and others? If such proof is at hand, I submit that the paragraphs about Mr. Blaine could be strengthened by spreading the facts among the biting sentences. Now, however much these sentences may be admired as specimens of sarcasm, they are hardly convincing except to the prejudiced mind.

H. M. Holmes.

Lansing, Mich., March 25,

CONSTITUTIONALITY OF LEGISLATION: THE PRECISE QUESTION FOR A COURT.

To the Editor of The Nation:

Sir: It is a common opinion that courts should declare laws unconstitutional when they think them so, assuming, of course, that the question is properly before them. In a sense this is sound; but in the sense in which it is generally held it is not. It is quite uniformly laid down that courts should not declare laws unconstitutional unless it is a very plain case, and it is put as strongly as this, viz., that the matter must be plain beyond a reasonable doubt. Thus, in the Sinking Fund Cases, 99 U. S., at p. 718, Waite, C. J., says:

"This declaration should never be made except in a clear case. Every possible presumption is in favor of the validity of a statute, and this continues until the contrary is shown beyond a rational doubt. One branch of the Government cannot encroach on the domain of another without danger. The safety of our institutions depends in no small degree on a strict observance of this salutary rule."

Here we have a strong statement of the doctrine, and also the reason of it—the judiciary must not, even negatively, assume the legislative function. A like statement may be found readily elsewhere, *e. g.*, in Wellington *et al.* Petitioners, 16 Pick., at p. 95 (Shaw, C. J.); and in People *vs.* Supervisors of Orange, 17 N. Y., at p. 241 (Harris, J.). In each of these cases the judge named is giving the opinion of the court. It is laid down by C. J. Cooley in this same form, in his 'Constitutional Limitations,' * 182, * 183, as the established doctrine; and, among various citations in support of it, he gives the striking language of Washington, J., in Ogden *vs.* Saunders, 12 Wheaton, at p. 270. Having just said that the question was "involved in difficulty and doubt," Washington, J., goes on:

"But if I could rest my opinion in favor of the constitutionality of the law on which the question arises on no other ground than this doubt, so felt and acknowledged, that alone would, in my estimation, be a satisfactory vindication of it. It is but a decent respect due to the wisdom, the integrity, and the patriotism of the legislative body by which any law is passed, to presume in favor of its validity until its violation of the Constitution is proved beyond all reasonable doubt."

Taking it so, and taking the reasons to be such, what is the precise function of the judiciary in this class of constitutional questions? *It is not that of declaring the true construction of the Constitution, but that of deciding whether another department has acted unreasonably.* If the conclusions of the judiciary and of the Legislature differ as to what the Constitution permits, it is to be accepted that the judiciary are, for most purposes, to pass finally upon the matter. But to pass upon it how? To pass upon what? This is the question.

The office of the judiciary here is not that which, in some of our States, they exercise when they answer questions put to them by other departments of the Government: then, of course, they give their own opinion. Nor is it that which they perform in passing on such questions as were canvassed in the Dred Scott case, or such as might arise now under the Thirteenth Amendment—questions of personal right under the Constitution, irrespective of any legislation. Here also there is a simple duty of declaring the Court's own judgment upon the meaning of the Constitution. But in determining the constitutionality of legislative action, a court is called upon to consider what, under the Constitution, is the admissible view, rather than what is the right view of legislative power. The question before it is this: Has the legislative department kept within a reasonable interpretation of its power? Can their action reasonably be thought constitutional? Does the question of its conformity to the Constitution fairly admit of two opinions? If it does admit of two opinions, then the Legislature is not to be deprived of its choice between them; for this choice is a part of that mass of legislative functions which belong to it and not to the court.

Now, the common form in which courts put the question to themselves, viz.: Is the law constitutional? is a dangerous one. It is right if rightly understood, and if it be kept in mind that a Legislature, in construing the Constitution for purposes of legislation, may adopt any construction which is reasonable, and may reject the one which the court, in reviewing their action, may consider the sound one. A majority of the court belong, perhaps, to the strict school of construction, and a majority of the Legislature to the liberal school; but it is not a judicial question whether the strict or the liberal theory be the sounder,

The difficulty with this form of question—viz.: Is the act constitutional?—is that it steadily tempts the court into stating its own opinion on questions that may be purely legislative or political, instead of fixing its attention upon the precise judicial function, that, namely, of determining whether the Legislature has transgressed the limits of reasonable interpretation. One may see, I think, an illustration of the danger of this form of question in the language of Bradley, J., in the Civil Rights Cases, 109 U.S., at pp. 9 and 10:

"Are these sections constitutional? . . . Has Congress constitutional power to make such a law? . . . We have carefully considered those arguments, . . . and have felt in all its force the weight of authority which always invests a law that Congress deems itself competent to pass. *But the responsibility of an independent judgment is now thrown upon this Court;* and we are bound to exercise it according to the best lights we have."

The words that I have underscored (occurring in a very able and sound judgment) seem, as I venture to think, to point to an erroneous view of the court's functions. We are not without analogies to help us in stating the right question, for the situation is not in all respects a new one. It is much the same situation as that in which a court finds itself when it revises the action of a jury or of a lower court in deciding questions of fact. Nothing is better settled than the rule in such cases; and yet, it may be remarked, here, also, courts occasionally err from inadvertence to the precise question. What is that question? Lord Blackburn touched it neatly last year in the House of Lords in the case of The Capital and Counties Bank *vs.* Henty, 7 App. Cases, at p. 776. He was laying down a doctrine in libel, that although the jury may find the defendant chargeable, yet the court, on a motion in arrest of judgment, may still hold the writing not to be a libel; since Fox's Act the jury must, indeed, have a chance at the question, but Fox's Act, he says, did not deprive the defendant of his old right to have the court pass on it also; *the defendant* has now a double protection. And Lord Blackburn goes on:

"Now it seems to me that when the court come to decide whether a particular set of words published under particular circumstances are or are not libellous, they have to decide a very different question from that which they have to decide when determining whether another tribunal, whether a jury or another set of judges, might, not unreasonably, hold such words to be libellous."

This passage illustrates perfectly the difference between a case where the court has to exercise an "independent judgment," and a case where it merely passes on the reasonableness of the exercise of judgment by another body. The doctrine in this application of it is familiar in our own courts, and authorities need not be quoted. I observe so neat a statement of it in the latest stage of the famous case of Belt *vs.* Lawes, in England, that I will quote a few words from the judgment of the Master of the Rolls. Belt, it may be remembered, recovered last year £5,000. On a motion for a new trial, on the ground that the damages were excessive, they were reduced to £500. Both parties appealed, and lately (London *Times*, March 18, 1884, p. 3) the Court of Appeal has unanimously refused to disturb the original verdict. The language of Sir William Brett, to which I allude, is this:

"The ultimate question for decision here is whether the original verdict can, according to the rule, be impeached. It can only be so if . . . the Court is enabled judicially to say that the evidence is so clear to the contrary of the verdict that reasonable men could not fairly find as the jury have done. . . . It has been said, indeed, that the difference between the rule and the question whether the judges would have decided the same way as the jury, is evanescent, and that the solution of both depends on the opinion of the judges. The last part of the observation is true, but the mode in which the subject is approached makes the greatest difference. To ask, 'Should we have found the same verdict?' is surely not the same thing as to ask whether there is room for a reasonable difference of opinion. The ultimate question being thus defined, the next inquiry is," etc.

In the class of constitutional questions, then, to which I am specially referring, it would seem that the function of the court is not that of fixing the construction of the Constitution which it believes to be the sound one, but that of determining whether another body, charged with an independent function which incidentally requires it to put a construction upon the Constitution, has discharged its office or exercised its judgment in an unreasonable manner. If this be so, it is much to be desired that it should be more distinctly recognized than is common by putting the question to be considered in a precise form. For it seems plain that our constitutional system, in its actual development, has tended to bereave our legislatures of their feeling of responsibility and their sense of honor, and also to lead the community off into mistaken views as to the office of the judiciary. It is a common saying in our legislative bodies when any constitutional point is raised, "Oh, the courts will set that right," and it has been said, I believe often, that the weakest objection that you can raise to a proposed measure in a legislative discussion is the constitutional objection. Certainly the courts have often assumed a tone that tended to encourage these views. But recent decisions may help to show how great, under our system also, is legislative power, and how limited is judicial control. Since this is really so, it is a matter to be steadily and heavily emphasized by the courts, and no less to be considered by legislatures and those who choose them.

JAMES B. THAYER.

CAMBRIDGE, MASS., April 3, 1884.

THE SALE OF PUBLIC DOCUMENTS.

TO THE EDITOR OF THE NATION:

SIR: Will you have the kindness to give me what information you can in reference to the method of the distribution of Government publications? Do the Washington bookstores have a monopoly of sale of certain or many of them? Are they bought by these dealers or are they stolen? If neither, what is the mysterious *tertium quid?* I have been endeavoring for a long time to secure a copy of certain reports of the Census Bureau, but so often as I appeal to my representing Masters Bountiful at Washington I soon receive a priced circular of Government publications by mail. Must we pay for these things twice, and if so, why not to the Public Treasury direct?—I am, sir, etc.,

GEO. M. GOULD.

COLUMBUS, O., March 26, 1884.

[We fear our correspondent will have to resort to one of the booksellers whom he mentions. Many protests have been made against the system of distributing "documents," but no considerable reform has been effected. Documents are of two classes, first, those printed by order of the House or Senate, and, second, those issued by the public offices, such as the Consular reports of the State Department, the "Circulars" of the Bureau of Education, the numerous and very expensive reports of the Geological Survey, etc. A certain number of all documents are, by law, delivered to the Smithsonian Institution to be used in "International Exchanges," *i. e.*, for distribution to foreign governments, as is also a supply of the first-named ("Congressional") publications to the Interior Department for distribution among home libraries. Of the bureau publications, some are sent out gratis, at the discretion of the head of the office, others being sold at cost price. The Washington booksellers referred to by our correspondent are, in the present chaotic condition of affairs, of great service to the public, both directly and indirectly, as, except through their agency, many of the older publications could not be got at all. We have heard of a bureau which printed a valuable and expensive work, of which the greater part of the edition was distributed to Congressmen, being able to get copies of its own report only by buying from the second-hand dealers copies which had passed directly to them through the hands of Congressmen. Many young men who serve Congressmen as secretaries are said to be recompensed for their services wholly or chiefly by the gift of documents.—ED. NATION.]

AMERICA AND VESPUCIUS.

TO THE EDITOR OF THE NATION:

SIR: In your No. 977, of March 20, you give a note claiming a German origin for the name *America*, and say the word itself is "radically German." There is not a single example in book or manuscript of the word *Americus* previous to the double mistake of Hylacomylus. *Americ* or *Amerrique* is an indigenous name in the New World, used, and in use even now, by the Indians of the Mosquito coast, to designate the country between the coast and the Lake of Nicaragua, and more especially the range of mountains, containing gold mines, between Libertad and Juigalpa, province of Chontales. By a double mistake of the German, Martin Hylacomylus Waltzemüller, a teacher of mathematics at the Gymnasium Vosagense, in the small town of St.-Dié (Lorraine), the popular name of *Americ*, which was spoken of without a specific locality as a country of the New World, very rich in gold, was given by him to Vespucci as the discoverer or inventor of the New World. In doing this, he first confused Vespucci and Colombo, and then changed the Christian name of Vespucci, which was *Alberico* in Italian, and *Albericus* in Latin, into *Americus* and *Amerigen*.

As the name *Americ* was well known among seamen, it was used without any knowledge of the mistake and of Hylacomylus's small and very rare book, 'Cosmographia,' the book and man being equally unknown to both Cristoforo Colombo and Alberico Vespucci.—Very respectfully,

JULES MARCOU,

42 GARDEN ST., CAMBRIDGE, MASS., March 27, 1884.

[The theory of the native origin of the name *America* is not so definitely established as Mr. Marcou would seem to imply. The "double error" of Waldseemüller is not proved. It is true that Vespucius is called *Albericus* in the early Latin translations of his 'Voyages,' but these translations were for the most part made from versions of an original the language and authorship of which are alike unknown. That they represent the only correct form of the name is improbable in view of the evidence in favor of *Amerigo*, which was the name of Vespucius's paternal grandfather, the name by which he was known to Columbus and the Spanish sailors, and that which he himself signed, using the spelling *Amerrigo*. The Venetian Ambassador at the court of Spain, reporting a personal interview with the navigator in 1505, calls him *Almerico*. The

use of the form *Americus* was a correction rather than a blunder on the part of the German geographer. There is nothing to justify the assumption that Vespucius, who lived until 1512 or 1516, never saw Waldseemüller's issue of his "voyages," especially as a book which appeared in three editions between May and September, 1507, could hardly have been excessively rare then, whatever it may be now.

Mr. Marcou asserts that the name *Americ* was in common use among sailors at the beginning of the sixteenth century. We should be pleased to be referred to any instances of such use of the word. If it were so widely known as to have penetrated to St.-Dié, it is surely strange that it did not appear on the earliest mariner's charts. The truth is, that the "native origin" theory rests only upon the present local usage of the word *Americ* in Nicaragua. This is its solitary fact; all else is ingenious—fatally ingenious—speculation.—Ed. Nation.]

THE GERMAN SPELLING REFORM.

To the Editor of The Nation:

Sir: As a member of the "Ferein für fereinfachte deutsche Rechtschreibung," whose publications you were kind enough to take notice of in No. 977 of the *Nation*, I beg leave to say some words in explanation. As you have correctly stated the aims of our Society, I need not dwell on them here; but as to the points urged by you, viz., whether the pronunciation of "und" be really "unt," etc., I think there can hardly be any doubt. Indeed, you will find no word in the German language (at least I am not able to recall a single example to the contrary, except in dialects), which, ending with *d*, is not pronounced as though it were spelled with *t:* for instance, *Kind, Hand, Hund* are pronounced *kint, hant, hunt;* but as soon as *es, e, er*, etc., is affixed, the *d* is pronounced as in English. Thus we say, "der Hun*t*, des Hun*d*es; "das Ban*t*, des Ban*d*es," etc. Now, since we have as our fundamental rule, "Write as you correctly speak," there is no reason why we should continue to write "Han*d*," when we say "Han*t*." And this is by no means something extraordinary; even in the English language you have many examples of the same kind, *e. g.*, thie*f*—thieves, hal*f*—halves, etc. Nobody would ever think of writing "thieve" because the plural is "thieves"; indeed, it would seem absurd.

As to the words "Han*t*lung" and "hö*k*ster," quoted by you, I must say that the former is a misprint in the *Kalender*, as is obvious, since "Handlung" is derived not from "hant," but from "handeln," and originally was spelled "Handelung." "Hökster" is the pronunciation of "höchster," prevalent in Southern Germany, but, of course, is not in its place in a classical poem. In the word "setzen" the first *e* is short, and therefore the *t* is needed to close the syllable; *sezen* would undoubtedly be read *se-zen*—a word totally unknown in German.

You are certainly right in your criticism of words like "Kromwel," "Moro," etc., appearing in the historical tables of the *Kalender;* but these and other points will be remedied in next year's issue. Indeed, the orthography of proper names cannot well be changed without impairing their intelligibility; but, on the other hand, great care has been taken by the Society to establish the true pronunciation of oft-used words taken from foreign languages, and the pages of the *Reform* contain valuable lists of Russian, Spanish, Hungarian, and Chinese names (geographical and historical), which have been of great use to its members.

A spelling reform cannot be introduced without struggles—in fact, attacks of every kind have not been wanting; but still we have had the satisfaction of our principles being adopted (although not therefore enforced) in the official orthography now in use in all German schools. Our demand for "*one* alphabet (the Roman) *only*" has been stubbornly opposed, even by men of undoubted literary renown, on the ground of patriotism, they regarding the German character as a German palladium (although it has long been proved that it originated only in the fact of the first printers imitating the script of the monk-copyists); but the damaging effect of the German letters upon the eye is being more and more widely appreciated, and only recently Professor Virchow took occasion to plead, in the Prussian Diet, for the universal adoption of the Roman alphabet—a demand made by J. Grimm more than half a century ago.

We therefore have good reason to hope for the final success of our movement; but to attain this it is necessary that every one interested in sound spelling, and, besides, in the propagation of our German language, should join our Society, and help, in his own way, to further the cause. I am certain that among the readers of the *Nation* there are a good many who will appreciate the importance of German spelling reform, and would willingly do their share in promoting it. I should be very glad to inform them, on application, of particulars.—Very respectfully, Otto Wollermann.

80 Second Street, Brooklyn, E. D., N. Y., March 31, 1884.

[Mr. Wollermann's assertion that *d* at the end of a syllable is pronounced like *t*, proves only that he considers any deviation from the rule "dialect." Yet we would ask him whether he himself pronounces *rund* like *bunt*, not to speak of *Pfad, Rad, Eid*, etc. And even he, as a presumable North German, will admit that the "fundamental" rule, "Write as you correctly speak," is not always a safe guide. For instance, in Hanover, Hamburg, and other parts of Germany, where the language is supposed to be spoken in its greatest purity, *sp* and *st*, in *Sprache, Stelle*, etc., are pronounced as written, while on no German stage with which we are acquainted—not in the classic Vienna Burg Theatre, which may be said to lay down rules for the pronunciation of the German language, as the Théâtre-Français does for the French, nor in the Berlin Court Theatre, nor in the Hamburg Thalia Theatre—is anything but the "dialect" pronunciation "*Sch*prache," "*Sch*telle," etc., ever heard. As regards *setzen*, we must admit that we were in error. The old rule which considers the *tz* merely an equivalent of *zz*, as applied to the new orthography, renders the *t* a superfluity in *Sitz*, though not in *setzen*.—Ed. Nation.]

Notes.

The following are some of the spring announcements which we take from the *Publishers' Weekly*, the editor remarking of the whole that they show the tendency of the trade to concentrate their business in the latter part of the year, instead of distributing it. *D. Appleton & Co.:* 'The Prose Writings of William Cullen Bryant,' edited by Parke Godwin; 'Louis Pasteur: his Life and Labors,' by his son-in-law; 'Speeches, Arguments and Miscellaneous Papers,' by David Dudley Field; 'Mental Evolution in Animals,' by George J. Romanes; and 'Electricity,' by J. E. Gordon. *Robert Clarke & Co.*, Cincinnati: 'Sorghum: its Culture and Manufacture Economically Considered,' by Prof. Peter Collier; 'Camping and Cruising in Florida,' by Dr. James A. Henshall; and 'The Principles and Practice of Common School Education,' by James Currie. *Geo. H. Ellis*, Boston: Dr. George Grove's essays on 'Beethoven's Nine Symphonies,' with illustrations from the scores. *Estes & Lauriat*, Boston: the complete works of Thomas Carlyle in twenty crown octavo volumes on the finest parchment-linen drawing paper, to be called the "Parchment Edition," and illustrated with original etchings, steel-engravings, etc., and limited to 375 copies; and 'Birds of Haiti and San Domingo,' by Charles B. Cory. *S. C. Griggs & Co.*, Chicago: a new edition of Prof. Wm. Mathews's 'Words, their Use and Abuse'; and 'Geological Excursions; or the Rudiments of Geology for Young Learners,' by Prof. Alexander Winchell. *Harper & Bros.:* 'Marcus Aurelius Antoninus,' by Paul Barron Watson; George Eliot's 'Essays and Leaves from a Note-Book'; a new "Library Edition," in seven volumes, of Coleridge's works, with an introductory essay upon his philosophical and theological opinions, edited by Prof. W. G. T. Shedd, and indexed by Arthur Gilman; 'Manners and Social Customs in America,' a book of etiquette, by Mrs. John Sherwood; and 'The Entailed Hat,' by George Alfred Townsend. *Henry Holt & Co.:* the 'Chanson de Roland,' translated by Prof. Léonce Rabillon, of Johns Hopkins University. *Houghton, Mifflin & Co.*, Boston: 'Margaret Fuller Ossoli,' by T. W. Higginson; 'Captains of Industry,' biographical sketches by James Parton; and a translation of the first twelve books of the 'Odyssey,' by Prof. Geo. H. Palmer. *Lee & Shepard*, Boston: 'Whirlwinds, Cyclones, and Tornadoes,' by Wm. M. Davis; 'The Military Reconnoissance of Alaska, in 1883,' under command of Lieutenant Schwatka; 'Wild Woods Life,' by Capt. C. A. J. Farrar; 'Beginnings with the Microscope,' by Dr. Walter P. Manton; and a new and uniform edition of J. T. Trowbridge's novels. *J. B. Lippincott & Co.*, Philadelphia: 'Leibnitz,' by John Theodore Merz; 'Life and Select Literary Remains of Sam Houston, of Texas,' by Wm. Cary Crane; 'Memoir and Correspondence of Eliza P. Gurney,' edited by Richard F. Mott; and 'Home and School Training,' by Mrs. H. E. G. Arey. *D. Lothrop & Co.*, Boston: 'American Explorations in the Ice Zones,' by Prof. J. E. Nourse, U. S. N.; 'Life of Oliver Wendell Holmes,' by E. E. Brown; 'The Great Composers,' by Hezekiah Butterworth; 'The Travelling Law School and Famous Trials,' by Benjamin Vaughan Abbott; and 'Health and Strength Papers for Girls,' by Dr. Mary J. Safford and Mary E. Allen. *Macmillan & Co.:* 'Autobiography of Hector Berlioz'; 'Investigations in Currency and Finance,' by the late W. S. Jevons; 'Selections from Cowper's Letters,' by the Rev. W. Benham; and 'The Boy Emigrants,' a series of letters from Texas, edited by Thomas Hughes. *Thomas Nelson & Sons:* 'Gulliver's Travels,' with introduction and explanatory notes, by Robert Mackenzie. *Phillips & Hunt:* an 'Index to the *Methodist Quarterly Review*, 1818–1881,' by Dr. Elijah H. Pilcher. *G. P. Putnam's Sons:* 'Six Centuries of Work and Wages: the History of English Labor,' by J. E. Thorold Rogers; 'The Woman Question in Europe,' by Theodore Stanton; 'The Franco-American Cookery Book,' by Felix J. Déliée; and a series of 'American Orations, from the Colonial Period to the Present Time,' edited in

three volumes by Prof. Alexander Johnston, of Princeton College. *A. D. F. Randolph & Co.:* Tyndale's 'Five Books of Moses,' a reprint, with collations, from the edition of 1530, edited by J. I. Mombert, D.D.; and 'Echoes from the Oratory: Selections from the Poems of John Henry Newman, D.D.' *Roberts Bros.*, Boston: 'The Making of a Man,' a sequel to 'His Majesty Myself,' by the late Rev. William M. Baker; a new edition of Emerson's 'Life of Margaret Fuller'; and Lord Ronald Gower's 'Reminiscences.' *Charles Scribner's Sons:* a translation of Busch's 'Our Chancellor'; and the 'Life of Frederick Denison Maurice,' by his son. *Scribner & Welford:* 'Chronicles of Newgate,' by Maj. Arthur Griffiths; and the 'Chief Works of Benedict de Spinoza,' translated by R. H. M. Elwes. *E. Steiger & Co.:* 'In der Neuen Heimath,' a collection of historical contributions on German emigrants in all parts of the United States, edited by Anton Eickhoff; and a series of accompanying 'Geschichtsblätter,' edited by Carl Schurz, and beginning with a revised abridged edition of Friedrich Kapp's 'Geschichte der Deutschen im Staate New York,' followed by 'Bilder aus der Deutsch-Pennsylvanischen Geschichte,' by Oswald Seidensticker; a new edition of Gustav Körner's 'Das Deutsche Element in den Vereinigten Staaten'; and 'Geschichte des Deutschen Elements in Staate Maine,' by H. A. Rattermann. *Thomas Whittaker:* Ellice Hopkins's 'Work among Workingmen'; and 'Anna Cavaye, or the Ugly Princess,' by Sarah Doudney. *John Wiley & Sons:* 'Metrology,' by Lieut. C. A. Totten—a defence of the Anglo-Saxon weights and measures, after the example of Prof. Piazzi Smyth; and President Barnard's counter work, 'The Metrological System of the Great Pyramid.'

George A. Leavitt & Co. will sell at auction in May the library of Alexander Farnum, of Providence, one of the notable private collections of that city.

A year and a half ago we reviewed the first volume of the Rev. E. M. Wherry's 'Comprehensive Commentary on the Qurán' (Boston: Houghton, Mifflin & Co.), in the "English and Foreign Philosophical Library." The second volume of this meritorious work has now come to hand, ending with the Surat al Raad.

Lee & Shepard, Boston, have put forth a cheap edition, in paper covers, of the 'Speeches, Lectures, and Letters' of the late Wendell Phillips. The plates are those of the Redpath edition of 1863, whose steel-plate portrait is here reproduced by "process." A slight biographical sketch is prefixed. An interval of fourteen years separates the first two addresses of this collection—a fact worth the attention of any biographer.

A new edition of Anna Ayres's 'Life and Work of William Augustus Muhlenberg' bears the imprint of A. D. F. Randolph & Co. It is an interesting narrative of a highly useful and benevolent career, to which fame was brought by a single hymn, "I would not live alway," that was the least among his achievements. As early as 1849, for example, he instituted the "fresh air" mode of charity, which has had such a development of late years. Two portraits accompany the work.

A quaint library for the young, entitled "More for Good than Glitter Series," has been begun by the Esperanza Publishing Co., Lebanon, Pa. No. 1 is the old story in rhyme of "Joe Dobson and his Dame," who exchange duties for one day, to the husband's discomfiture. No. 2 is the rhymed "School of Good Manners." In both these brochures the facsimiles of the original cuts or engravings are the striking feature.

We have received the first number of *Hebraica*, "a monthly journal in the interests of Hebrew study," issued in Chicago by "The American Publication Society of Hebrew." The "managing editor" is William R. Harper, Ph.D., Professor of Hebrew and the Cognate Languages in the Chicago Baptist Union Theological Seminary, and the monthly is to be a companion to the *Old Testament Student*, issued under the same auspices. The new periodical is, we are informed, mainly intended for the benefit of a school for the study of Hebrew by correspondence, organized within three years, and already including over six hundred clergymen and students—which, for three years, is a tremendous success. The members of the school, we are further told, reside "in almost every State in the Union, in Canada, in England, in Scotland, in Ireland, in Turkey, in China, in Japan, in India." Mr. Harper has procured for *Hebraica* the coöperation of two excellent Oriental scholars, Dr. Strack, of the University of Berlin, and Dr. Haupt, formerly of the University of Göttingen, and now Professor of Semitic Languages in Johns Hopkins University. If the journal is to be worthy of such "associate editors," we cannot refrain from suggesting to Mr. Harper that some of its features, which give it the look of an advertising medium in the "interests" of the school described above and of its managers, must be made to disappear, and a generally good revision of its contents secured. The only slip in Hebrew which has struck us is *'ebed* for *'eber*, in Luzzato's sonnet—an old piece, perhaps deservedly reprinted. The number consists of twenty-four 8vo pages, and embraces some original matter of merit, besides some notices copied from books and periodicals.

Mr. W. J. Linton continues his good work of exposing pseudo-Bewicks, in the *Academy* of March 22; his text here being the Charnley edition of Fables (1820), and Pearson's reprint of Saint (1878). His information will be of great value to collectors.

It has already an ancient sound when a son now living tells of his father's bringing to England the first news of the battle of Leipzig. This is what Mr. Edward Solly does in the March *Bibliographer* (J. W. Bouton). The elder Solly was fifteen days in doing it, and beat the bearer of the original despatches. The story is apropos of "News and Newspapers." A correspondent makes the useful and probable suggestion that Spenser derived the mythology of his 'Faerie Queene,' not from the classics, but from Boccaccio.

The March number of the *Library Journal* contains a portion of the thoughtful and stimulating address of Prof. Moses Coit Tyler, delivered at the opening of the Sage Library at West Bay City, Michigan, in January last. In his interesting historical review of the stages of library formation in this country, he records the universal failure of the costly district-school libraries invented by DeWitt Clinton. He fails, it seems to us, to put his finger on the fundamental error, which was in seeking to elevate the pupils instead of the teachers. Had the same amount of money been expended in books of reference for them, the improved quality of teaching would have made return a hundred fold. This is still a desideratum.

Charing Cross and its changes are pleasantly described in the opening paper of the current *English Illustrated Magazine* (Macmillan), by Austin Dobson. A number of curious old prints and some recent drawings (not so good that photographic representations would not have been preferable) assist in the story.

A paper on "Esoteric Buddhism" seems misplaced in the *Bay State Monthly* for March. Both this number, however, and the current one, are in the main true to the Massachusetts biographic-historical ideal of the editor. The April number prints a facsimile of the recently unearthed oration delivered at Hanover, N. H., by Daniel Webster, on July 4, 1800.

The Education of Women, and Van Buren's Administration are the topics of Mr. Foster's *Monthly Reference Lists* for March.

Dr. Earl Flint contributes to the March number of the *American Antiquarian and Oriental Journal* a particular account of human footprints uncovered by him in a quarry at Managua, in Nicaragua, the overlying rock being seven inches thick. The locality is a lake shore. Two of the prints have been secured for the Peabody Museum at Cambridge.

One does not look for humor, outside of 'Pickwick' or Bret Harte's famous Stanislaus Society, in the proceedings of antiquaries, but last year's report of the Philadelphia Numismatic and Antiquarian Society is well calculated to amuse. A reverend gentleman communicated "a remarkable fact, which he had discovered after long study, viz.: that the Mongolian symbolism of writing was to be found on the rock sculpture of Mexico and Central America." Not content with this, he read an essay on the Dighton rock inscription, hitherto associated with the Northmen, but which he had "translated by means of Chinese radicals" to the following truly elegant effect: "A chain or band of folk from the sunrising (or East), after a long and stormy voyage, found the harbor of a great island. On landing and tying up our boats, we first gave thanks and adoration to God, Shang-Ti, the Supreme Ruler of the universe. We then sacrificed a human head to the moon, burning it and the body on a round sun-altar. . . . Our mouths hankered after something to eat and drink. We found the blue-black maize of our native land and wild fruit. We filled our rice kettles," etc. etc. If this is a sample of what the "Chinese radicals" are capable of, we are confident they might usefully be applied to the glacial scratches.

The latest *China Review* (November-December, 1883), by the way, has some capital specimens of Hakka folk-lore, the original characters being placed beside the translation. "Do not say that because the good is little it is not to be done, or that because the evil is little you may do it." "Men should not be too obstinate; . . . the wicked man will always be outdone by one more wicked; . . . and the longest-toothed wife will find her match with a raw potato." "Though he has never eaten pork, he has seen a pig run."

Prof. George H. Cook's annual report shows that the topographical survey of New Jersey has now been completed for nearly two-fifths of the total area of the State in the most difficult portion, so that more than one-half the labor has been done. Two more of the seventeen sheets of the map are about ready for distribution. Artesian wells sunk at Ocean Grove and Asbury Park have revealed conditions favorable to a perfect water supply of the entire southern coast, which has now become so great a summer resort. The chapter on the Archæan iron-ore-bearing rocks is like a technical lesson, with illustrations, in geological structure. There is an extensive table of dips for these rocks. Copper mining in New Jersey has taken a fresh start under more promising auspices than ever, and the graphite product is now getting to be considerable.

From the State Geologist of Alabama, Mr. Eugene Allen Smith, we have his agricultural report for the year 1881–82, replete with scientific and practical information, including an orderly agricultural description of each of the counties. The discussion of population and cotton production has a general interest. Taken as a whole, the State yields about one bale for every

two inhabitants, and the crop is, of course, mainly produced by the blacks. Where they are most in excess of the whites, the naturally richest lands exist, but also the largest farms and the most exhausting and ruinous system of cultivation; where the races are nearly equal in number, farms are small, and land poorer, but better worked and more fruitful and more varied in crops. The very poorest lands mark a great preponderance of whites. Such is the prevailing system of credits that "the whole cotton crop is usually mortgaged before it is gathered." This volume has been prepared in conjunction with the Census Bureau, and uses the physical maps of the late census.

"The Glacial Boundary in Ohio, Indiana, and Kentucky" is the title of a pamphlet just published by the Western Reserve Historical Society, at Cleveland, Ohio. The author, Prof. G. Frederick Wright, of Oberlin, is well known for his enthusiasm on this subject. His conclusions are here mapped and explained, and in the case of Ohio a detailed report of his researches is given. Professor Wright notes the coincidence between the glacial boundary in that State and the southern line of wheat production. We will point out another. In 1880 the centre of population in the United States rested almost exactly upon it, in the little belt which crosses Kentucky.

The fourth annual report of the Central Sanitary Bureau of the Japanese Government covers the year July 1, 1878-79, and contains much curious information. The number of medical students in public schools and hospitals was 4,313, but only 2,868 were pursuing a strict course. Licenses were granted to sell nearly 5,000 different kinds of patent medicines; yet this number represents a large falling-off since the year before. As in the case of our "bitters," venders carried on a profitable trade in *sake* without paying the wine-tax, by mixing with ordinary Japanese wine a small quantity of some medicament.

Exceptionally valuable are the contents of the fourth annual report of the Massachusetts Board of Health, Lunacy, and Charity for the past year. Elaborate papers on the adulteration of food, and on eyes and industries, have a universal interest; so, indeed, has that on the reformed sewage of Nahant, while the subject of the paper on leprosy is, we are told, of increasing moment on account of foreign immigration. Nor do we remember any such comprehensive statistical summary of the public water-supply of a single State as is given here. The bibliographies of food adulteration and of leprosy deserve to be noted.

The Pilot Chart of the North Atlantic Ocean issued by the Hydrographic Office will hereafter be issued on the first of each month. That for April 1 records very severe weather in March and an unprecedented area of floating ice. The bergs and fields reported are pictured on the map, as also are wrecks of ships encountered. The direction of currents and winds is graphically shown as usual, and notices are printed of the latest tidings as to buoys, shoals, etc.

On April 5 appeared the first number of volume two of *Mélusine*, a review of mythology, popular literature, traditions and usages, founded in 1877, and then suspended at the close of the first volume. Its conductors, MM. H. Gaidoz and E. Rolland, remain the same; the scope of the review will be enlarged so as to stimulate research by editorial suggestion. The publisher is A. F. Staude, 6 rue des Fossés-St.-Bernard, Paris, and the subscription price 22.50 francs to foreigners.

Mr. Christern has received a volume of great value to economists, being the official testimony taken by a committee of inquiry into the condition of French workingmen and industries during 1882 and 1883. This inquiry was ordered by Government from a sense of the disastrous effects of foreign competition and a desire to apply a remedy. Quantin is the Paris publisher.

From the same source come to us the early numbers of the ninth volume of the *Gazette Anecdotique, Littéraire, Artistique, Bibliographique*, edited by G. D'Heylli, and published by Jouaust—a pretty, handy little fortnightly chronicle of the town's doings and sayings ("les mot sde la quinzaine"), with literary varia, such as unpublished letters of Rachel, of Louis Veuillot, of Jules Sandeau, the numbering of the streets of Paris, familiar quotations, etc. The value of this collection will always be enhanced by its readability.

The double number of the *Bulletin de Correspondance Hellénique* of the French School at Athens for January and February contains five plates of Greek leaden *tesseræ*, comprising 225 specimens, many showing obverse and reverse, and forming a most interesting collection of numismatic designs. These were probably the seals of towns or individual merchants, and are mainly of the Macedonian or Roman epochs, though some are early and very fine. The literary contributions comprise a series of inscriptions from Amorgos, by Koumanoudes, the ablest of Greek epigraphists; from Kalymnos by Dubois, of the School; from Maronia, by Reinach; a series of "free papers," inscriptions recording the liberation of slaves, from Chæronea and Orchomenos, by Latichew; and a most important paper on the Romans at Delos by Homolle, one of the students who have been in charge of the work on that island. A contribution by the Director, M. Foucart, concludes the list. To the student of Greek epigraphy the *Bulletin* is the most valuable contemporary publication.

— For the clearer understanding of a subject which never may be altogether freed from obscurity, Mr. Abner C. Goodell, jr.'s, 'Further Notes on the History of Witchcraft in Massachusetts' (Cambridge: John Wilson & Son) should be read in connection with Mr. George H. Moore's 'Notes on the History of Witchcraft in Massachusetts' (Worcester: Charles Hamilton), and the March Proceedings of the Massachusetts Historical Society. Many able historians and jurists, in reviewing the Salem witch trials of 1692, have condemned the whole proceedings as irregular and illegal. We believe we may say that almost all the "authorities," from Hutchinson down to Palfrey, have denounced the court as a "sham court," and the law upon which the trials were based as a "dead letter." The quoted words, though used by only one writer, seem fitly to express the opinions of many. The court was a "sham court," say these writers, because by a provision of the Province charter the General Court was alone empowered to "erect and constitute judicatories and courts of record or other courts" for the hearing, trying, and determining of "all manner of crimes, offences, . . . actions, matters, causes, and things whatsoever" happening within the Province; and they argue that it was "a gross usurpation of power" for the Governor (Phipps) to institute a court of oyer and terminer for the trial of the accused witches, his privilege being limited to the appointment of the commissioners thereof. Hutchinson (and his view seems to have been unhesitatingly adopted by subsequent historians) says that "at the first trial there was no colony or provincial law against witchcraft," and that the applicability here of any of the witchcraft laws of the mother country may be fairly questioned. The first act of the first Provincial General Court was to revive the whole colonial code of laws (including laws against witchcraft)—an inferential admission that the authority of these laws ceased upon the abrogation of the colonial charter, and consequently that at the time of the first witch trial the witch law was a "dead letter." Mr. Moore and Mr. Goodell have taken a bold stand in opposition to these views, and rarely have we seen so many evidences of careful research brought to bear upon a debatable question of history as are exhibited in their pamphlets. Mr. Moore engages to prove the sufficiency of statute and common law in all the proceedings against the accused witches; while Mr. Goodell declares in favor of the validity of the court, that it was erected in strict conformity to law and precedent and the "express language of the charter." Another important question is brought up for discussion, namely, whether the law of 1711, reversing "the several convictions, judgments, and attainders" against the condemned, was ever duly enacted—Mr. Goodell for the affirmative, Mr. Moore for the negative. Mr. Goodell offers as evidence a copy of the act, purporting to have been printed two years after its enactment, and follows its progress "from the inceptive petition to its final passage," by extracts from the official records. A heliotype copy of the act is inserted in his pamphlet. Mr. Moore maintains that the law was inoperative, not having received the approval of the Governor; that there being but one copy in existence furnishes a presumption against it; and further, that the reversal of attainders was a prerogative belonging to the King and Parliament, "and it is measurably certain that this act never came under the notice of the Privy Council." The law has often been referred to by local historians, some of whom have made verbatim quotations therefrom, and Mr. Moore is the first to pronounce publicly against its genuineness.

—The *Art Union* monthly contains a long and interesting account of the manufacture of and trade in bogus pictures, which will interest collectors even though it do not teach them how to protect themselves. The public must learn that in art matters *expertise* is an affair of education, and the millionaire who ventures to buy on his own account without that education may buy what pleases him, and may be trusted to pay no more than he can afford, but that his purchases will be worth commercially what they cost him is a matter of uncertainty—the reverse is far more likely. But there is no occasion for compassion towards the defrauded: if a man has got what pleases him, and pays what he can spare, he has no ground for complaint. To cultivate his taste to the point that he can purchase wisely is an expensive process, and the ordinary millionaire cannot afford it. It is reserved for men, like Messrs. Walters, Martin Brimmer, Quincy Shaw, etc., with whom art has been a life-long study, to make collections on their merits which will prove permanent, sound investments. There is, however, one consideration which the public has not yet taken in: if a picture is known to be a Corot (to take our illustration from the recent Dumas case), it is worth 12,000 francs, and if it proves to be by Trouillebert it is only worth 400. The difference is the autographic value of the work. An original drawing by Raphael, properly authenticated, will be worth in the market thousands of dollars, where an exact copy by an expert and known draughtsman will be worth the hundredth part of that price, and a good facsimile by photography only a dollar. An original letter of Raphael's will be worth even more in comparison with the copy. Now this enormous difference is due purely to the reverence or regard we entertain for any authentic relic of the great men of the past, and increases as they recede into the region of "has been;" a

certain reverence which surrounds the artist increasing this autographic value of works of art more than is the case with men of most other professions. This is the reason why the authenticity of a work of art becomes an important element in determining its money value; its absolute value is quite indeterminable—has in fact no figure. That Raphael had ever touched a palette or a pencil would make it a relic of great price; that which has not only the touch of his hand but the perfect expression of his mind, is still more exalted by the apotheosis of time. The only alternative for our collectors who will not study art is to buy from the artists while they are living. Those who fear that the removal of the tariff will favor the introduction of "trash" may be consoled by the *Art Union's* revelations of the factories of the worst kind of trash in this city, the turning out of oil pictures at $10 the dozen, *framed*, at wholesale. The Yankee genius is not to be circumvented where money is to be made, and it is certain that we can turn out greater and cheaper trash than has ever been imported.

—The affectionate tribute to the late Mr. Lasker by his friend Rodenberg, in the *Rundschau* for March, is followed in the April *Nord und Süd* by an (artistically) admirable etched portrait, and a sketch, by an anonymous writer, who describes himself as having been Lasker's political and party associate. Lasker's individual career is important enough for the article to be worth reading on his account, but its chief interest is as an illustration of German political ideas. The writer corroborates all that has been said by others respecting Lasker's extraordinary disinterestedness, his absolute negation of self as regards personal reward and political preferment, his entire patriotism. But the curious thing is that, as regards his political action, Lasker is praised not for what he did but for what he abstained from doing; not as an originating and propelling, but as a restraining force. We need hardly remind the reader that in German politics there are three constant elements besides several accidental ones (among which, of course, is Bismarck). These permanent features are the Conservatives, the Liberals, and the Catholics. Aloof from these has always stood Bismarck, surrounded by a small band composed partly of personal disciples, partly of adherents of the head of the Government as such. Though it is doubtless true that he detests parliamentary government, it is undeniable that he has proved himself a consummate parliamentary tactician, for by using each party in turn he has succeeded in carrying out nearly all his plans without adopting the peculiar ideas of any of the factions. Now the party of which Lasker's ability, energy, power of work, and hold on the people, caused by their consciousness of his disinterestedness, made him the leader in fact if not in name, had this and this alone in common with Bismarck—that they wished, above all other things, the establishment and maintenance of German unity. Each secretly regarded the other as a necessary evil in the accomplishment of this purpose, and some Liberals (the Fortschrittspartei, stigmatized in this article as doctrinaires) saw from the beginning that as soon as Bismarck had accomplished his immediate object he would throw over his Liberal allies in favor of a new combination. They, therefore, consistently acted up to their principles, never trusting Bismarck further than they could see him, never surrendering for the sake of half a loaf what they deemed their legitimate, if impracticable, claim upon the whole. Lasker, on the contrary, was the great advocate of what the French call opportunism—not exactly the same as our expediency—and this, in the opinion of the *Nord und Süd* writer, constitutes his best claim to gratitude and remembrance. Without departing from Liberalism in theory, Lasker is here represented as always ready on national questions to "pool issues" and vote with Bismarck, until the time came when he had to acknowledge, though with the greatest reluctance, that Liberals could no longer bend their policy so as to follow Bismarck without entirely losing their identity. As to the final value of this policy, the opinions of Liberals will always differ, because there will never be agreement as to whether his series of compromises secured much that was otherwise unattainable, or whether, by enabling Bismarck to consolidate his power without giving guarantees against its abuse, it made it possible for him in the end to turn his back upon all Liberalism. The view of Lasker's immediate followers is shown clearly enough by the fact that, relieved of the influence of his character and reputation, they at once coalesced with the more consistent Liberals, who had never ceased to upbraid Lasker with time-serving and subserviency.

—Seldom has a new work of sterling merit met with such immediate and emphatic success as Dvořák's "Stabat Mater" on Thursday evening at the third concert of the New York Chorus Society. The members appeared in full force, and listened to the Bohemian composer's masterpiece with rapt attention and a generous disposition to applaud its many beauties, as well as the merits of the performance. Every lover of serious music must feel grateful to Brahms, Liszt, and Joachim for having discovered the gifts of Dvořák, and given him an opportunity to acquire an international reputation commensurate with his genius much sooner than would have been the case without such influential friends. The "Stabat Mater" at once takes its place by the side of the best works that have been composed to the same words. It is by no means Dvořák's latest opus, having been written nearly ten years ago. From his other compositions it differs in being less strongly flavored with Slavic ingredients, as conditioned to some extent by the nature of the subject. And yet its nationality is unmistakable, mainly on account of the uninterrupted flow of chaste, pure melody. Those who observe the signs of the times must perceive that, now that the fountains of Italian music are exhausted, a new stream of melody is being turned into European music. It is more healthy in tone, less artificial in structure, and suggests the open fields and forests rather than the hot-houses in which *fioriture* and rank arias are reared. The "Stabat Mater" illustrates this new tendency. It is not only full of melody, but the melody is simple and yet never commonplace, because it rests on a substantial, rich, and varied harmonic basis. The accompaniment also is melodious in all its parts, and this gives the score a polyphonic aspect, although never at the expense of clearness. The changes of key are often surprisingly beautiful, being sometimes brought about through a suspension, at other times by an abrupt but natural transition which suggests Schubert in manner rather than in substance. The instrumentation gives evidence of an exquisite color sense, rare even at the present day. All the families of instruments are impartially considered, and true genius is displayed in the manner in which certain instruments are combined with the voices, no less than in the *transitions* from one tint to another, which are always arranged with a sense analogous to that for complementary colors and contrasts in the world of sight; and this is a feature to which most composers do not pay sufficient attention. The general character of the work is, of course, sombre. Several London critics have objected to the predominance of the minor keys in the "Stabat Mater." This is a peculiar objection, which is met by three answers: (1) The sad and solemn character of minor makes it especially suited to the words to which it is set; (2) the tendency of modern music, as already noted by Schumann, is toward minor in preference to major, because it facilitates modulation; (3) Slavic music, in particular, favors the minor mode, as was the case with music generally as long as melody predominated over harmony. Dvořák's treatment of the voices is no less commendable than that of the instruments. In several of the numbers fine effects are produced by the gradual addition to a solo voice of two or three others. The choruses are without exception interesting, several of them grand and inspiring. Indeed, there is hardly a dull moment in the whole work, and it is, therefore, needless to single out any parts for special praise. In number ten and one of the preceding numbers occur chorale-like passages for unaccompanied chorus, which produced a great effect, and were magnificently sung, showing even better than the accompanied parts of what good material the Chorus Society now consists in all its members, and how well it has been trained. [Special attention was paid to the shading, especially the numerous sforzandos and crescendos which occur in almost every bar. The solo parts were effectively rendered by Misses Emma Juch and Winant, Messrs. Graff and Heinrich.

—An interesting experiment was made at the sixth concert of the Symphony Society on Saturday. Beethoven's quartet in C sharp minor, op. 131, was played in a version for full orchestra made by Karl Müller-Berghaus. The experiment was worth making, even if it should not prove to be of permanent value. Of course the practice is common, in American and European concert halls, of playing single movements of a string quartet with the full string orchestra. Most concert halls are too large to enable four players alone to be heard to advantage, and this procedure is therefore the only way of familiarizing the masses with the gems of chamber music. The arrangement of a whole quartet for full orchestra, and especially of so unique a work as Beethoven's opus 131, is quite another thing. Fortunately Müller-Berghaus is not only a good quartet player, thoroughly familiar with the later Beethoven, but he also understands the uses of the orchestra. In his version the strings of course predominate, the wind instruments being chiefly used to give variety in cases of repetition, and to emphasize the melody when it occurs in the middle parts. Nowhere are the limits of Beethoven's orchestra exceeded, and it is probable that had Beethoven himself *arranged* his quartet for orchestra the result would have been similar. Had he *written* it for orchestra, it would have been different; the harmonies on occasion would have been richer and the treatment of the parts more complicated. For, notwithstanding the excellence of Müller-Berghaus's work, the quatuor does not in its new garb quite merit the title of "a new Beethoven symphony." Its original purpose cannot be disguised; and, for our part, we should at any time prefer it as played by the Joachim Quartet at the Berlin Singakademie than as given at the Academy of Music by Dr. Damrosch's orchestra, although the performance was, on the whole, intelligent and meritorious. Many passages in this magnificent work disclose their full beauty only after repeated hearing, and familiarity is apt to breed that enthusiasm which caused Wagner to exclaim that the last movement is "the dance of the world itself; wild delight, the lamentation of anguish, ecstasy of love, highest rapture,

misery, rage, voluptuousness, and sorrow." Like all the works of Beethoven's last years, this quartet is prophetic of the change which was to come over music after him, in so far as the architectural principle was exchanged for the poetic, dramatic, and psychologic. Here we have no longer four movements of equal length symmetrically grouped together; but the movements become shorter and twelve in number, counting the separate variations; while within each movement there are numerous ritardandos that give the effect of poetic emotion.

CATHARINE II.

Katharina die Zweite. Von Dr. Alexander Brückner, Professor an der Universität Dorpat. Mit Portraits und Illustrationen. [Forming vol. x. of the third main division of the 'Allgemeine Geschichte in Einzeldarstellungen,' edited by Wilhelm Oncken.] Berlin. 1883.

THE character pictures of the "Semiramis of the North" have been as diverse as those of Napoleon I. According to some, she was, with all her foibles, one of the grandest apparitions in history, combining equal power, genius, liberalism, and generosity; according to others, she was, with all her ability, one of the meanest women that ever swayed the destinies of a great country; and most varied have been the accounts which endeavored to strike a just balance between those extreme views. The appearance of the 'Mémoires' of Catharine herself, which Alexander Hertzen published in 1859, and the genuineness of which has long been generally recognized, has silenced the writers of panegyrics of her forever; the successive publication, in Russian and foreign collections and periodicals, of a vast mass of her correspondence, and of contemporary notices concerning her, has revealed traits incompatible with the idea of her having been entirely devoid of the better feelings of humanity and of her sex. The balance is now overwhelmingly against her as to her moral worth, though greatly in her favor when her gifts and accomplishments are considered. What she has been to Russia and to Europe, by her boundless ambition and restless activity, is a question on which something like an accord of opinion can much less easily be reached, if at all. Mourners of Poland will ever curse the memory of her whose heartless Machiavellian diplomacy and ruthless warfare undermined and destroyed the existence of that unfortunate nation. Admirers of the transformation of Russia inaugurated by Peter the Great cannot fail to see in Catharine a shining continuator of his work of reform and civilization. National writers of Old-Russian proclivities, inclined to ascribe the gravest ills of the Empire of the Czars to the departure from the ancient Slavic traditions and ways, and the covering of its surface with a worse than useless foreign varnish, must find in the German Princess who was Peter's fourth female successor a better Russian than he was himself, but yet a "Westerner." Applauders of the rise of Slavic and other Christian nations on the ruins of the Ottoman Empire will easily pardon the wholesale butcheries committed by the Rumyantzeffs, Potemkins, and Suvoroffs while leading Catharine's armies toward the Danube. Others will not forget that those fierce wars had for their only object the substitution of the barbaric sway of Muscovite autocracy for Turkish irregular oppression, that they ruined the political equilibrium of Europe, and resulted in perils to that continent more to be dreaded than any with which the Crescent ever menaced it.

Professor Brückner does not enter into the consideration of topics like these. His history is almost purely biographical and objective. He has labored, as to his materials, under an oppressive *embarras de richesse*, and has had to contend with difficulties of expression arising out of his position as professor at a Russian university; but he has succeeded in making the comprehensive volume highly interesting in the best sense of the word, and, in regard to historical veracity and authenticity, not unworthy of its place in the eminent collection of which it forms a comparatively very conspicuous part. His Catharine is a picture fully, laboriously, and carefully executed, though not without a strong favorable bias.

Professor Brückner dwells with complacency on the rare mental qualities which distinguished his heroine in her youthful years. When a mere child, she was remarkable for her serious, cool, and calculating intellect, great energy, and freedom from caprice and levity. When she entered the Russian court (in 1744), at the age of not quite fifteen, to become the bride of the future Czar Peter III., she at once grasped all the difficulties of her situation, and resolved how to meet them. There were unavoidable collisions with her own ambitious mother, wife of the Prince of Anhalt-Zerbst, who had taken her to St Petersburg; with the Empress Elizabeth, who evinced some mistrust toward the gifted young Princess; with Peter, who felt no affection for her. She was determined to make herself mistress of the situation, to become Empress of Russia at any cost. She shrank from no sacrifice to her feelings, from the employment of no means. She had to fall back upon the resources of her own mind, upon herself. In the midst of a glittering and revelling court, of gazing multitudes and scrutinizing observers, she lived in complete isolation. She devoted her time to studies and the acquisition of various accomplishments, to self-culture in the broadest sense. In the shadow of a throne whose mistress, a daughter of Peter the Great, displayed all the brutality and little of the genius of her father, and linked to a most contemptible young Prince, who was devoid even of what was barbarously grand in his imperial aunt and grandfather, Catharine kept up a constant communion with the leading ideas and spirits of the age, and became an adept in its liberalism—a devoted disciple of Montesquieu and Voltaire, Diderot and D'Alembert. But at the same time she practised horseback riding and hunting, she was ostensibly a most devout follower of the Greek Church—having abjured her Protestantism—acquired a perfect fluency in the language of her adopted country, and in every way showed herself a Russian of the Russians; while the Crown Prince, her consort, alienated the attachment of his future subjects by clinging to German habits, notions, and predilections brought from his paternal duchy, Holstein-Gottorp, though by no means shrinking from the coarseness of the vilest Russian associations. The contrast was complete, and Catharine consciously and calculatingly labored to render it striking.

It is almost painful to follow our author in his descriptions of all the exhibitions of imbecility, brutality, and disgusting licentiousness and intemperance with which the heir to the throne of all the Russias, and its occupant for a few months, afflicted his unbeloved and unloving wife. It was hardly necessary to make this record so long, and perhaps not entirely fair either, for a part of it rests on the authority of her whom Peter by turns neglected, tormented, and threatened, until she resolved on his violent removal from the path of her towering ambition. As in her 'Memoirs,' so here, the particulars are minutely stated for apologetic purposes. They are to extenuate the guilt of her conjugal infidelities and of the treasonable *coup*, prepared with so much premeditation, by which Peter, in July, 1762, was robbed of his crown and life. There was a time when those infidelities were still half-denied by loyal historians. Catharine's own confessions—frank, petulant, and even cynically boastful—have rendered a further denial impossible, and even a professor of history salaried by the Russian Government can now more or less clearly state—at least in a work published beyond the border of the Empire—that, of the three children to whom the future Empress gave birth, Paul, her successor, father of Alexander I. and Nicholas, and great-grandfather of the reigning Czar, was the son of Saltykoff; Anna, who died an infant, the daughter of Stanislas Poniatowski; and the youngest, the erratic and dissolute Count Bobrinski, a son of Grigori Orloff ("Der Sohn Katharinas und G. Orlows," we read on page 46). On the other hand, Catharine is warmly defended against the accusation, formerly and still lately current in histories, that the strangling of Peter, at Ropsha, a few days after his dethronement, in which Grigori Orloff's brother Alexei had the most direct part, was not only a natural epilogue to her usurpation—for enacting which nobody was punished or disgraced—but a deed unequivocally ordered by herself. The question is immaterial. Catharine certainly did nothing to prevent the bloody consummation, and she would as certainly have commanded it had her interest decidedly required it. It was perhaps only a useful crime, done before it was needed. Over the ghastly scene of the assassination our author casts a veil.

The murder of the ex-Czar Ivan, in his prison, is a parallel to that of Peter III. That unfortunate Prince was a grandnephew of the Empress Anna Ivanovna, Peter the Great's niece, who reigned from 1730 to 1740, and was by her appointed heir to the Russian throne, to reign under the regency of Biron, Duke of Courland. The Empress died before he was a year old, and his mother, Anna Karlovna, overthrowing the appointed regency, seized the reins of power in his name. A year later Anna was in her turn overthrown by Elizabeth, and sent with her husband, the Duke of Brunswick-Wolfenbüttel, to an island in the Dvina, near the White Sea. Ivan was imprisoned in the vicinity of St. Petersburg, and kept there in extraordinary secrecy throughout the twenty years of Elizabeth's reign. When Catharine seized the throne she had him hastily transferred from the fortress of Schlüsselburg to Kexholm, apparently in order to use his mysterious place of confinement for Peter III.; but after the tragedy at Ropsha he was returned to his old prison, where he lingered two more years in his wretchedness. The officers who guarded him were instructed never to hand him over to anybody, unless shown a direct order of the Empress herself, or of Panin, her Minister of State; and, in case an attempt should be made to deliver him by force, to slay him on the spot. Such an attempt was made by a few military conspirators in 1764, and the officers did as commanded. When the chief of the conspiracy, Mirovitch, had forced his entrance into the room of the prisoner whom he was going to reinstate on his Imperial throne, he found him on the floor—a corpse. The officers reported to Panin, Panin reported to Catharine, and the disciple of Diderot wrote in reply: "God's ways are wonderful and inscrutable"; "Providence has granted me a sign of his mercy"; "I trust to God that this attempt will be wholly revealed"; and, "As much as I desire that God may make it clear whether there are any accomplices, just so do I implore the Almighty that no innocent men shall be plunged into ruin." Whether the rack should be employed to help the Almighty in revealing the whole of the plot and saving the innocent, was a question referred to the Empress

by the Court of Inquiry, and referred back by her to the Court, for its independent decision, as a matter the consideration of which was too painful for her own excited feelings. Fortunately the Court remembered that the Empress had formerly declared herself opposed to the rack "on principle"—although Beccaria, afterward one of her favorite liberal writers, was but then publishing his 'Dei delitti e delle pene'—and Mirovitch was executed untortured. The excitement caused by the affair was immense, and Catharine had to issue a manifesto in explanation of it. "She was deemed capable of using Mirovitch as a tool in carrying out the murder of the unhappy pretender, and of sending him to the scaffold in order to get rid of a dangerous sharer of the terrible secret." And such versions of events in Catharine's reign have but gradually been abandoned even by grave historians of our time. Professor Brückner calls them "monstrous fables."

Scarcely had Catharine been delivered of the danger with which the legitimate claims of the ex-Czar Ivan might have threatened her possession of the crown, when the tranquillity of her reign began to be disturbed by a succession of adventurous popular pretenders, each claiming to be Peter III., miraculously saved from the murderous hand of his adulterous consort. Gavrila Kremneff, in 1765, was the first of these pseudo-Peters; the most formidable was Pugatcheff, who in 1773-4 headed an insurrection of Cossacks, peasants, and non-Russian populations, which desolated the districts east of the Volga, shook the empire to its foundations, and for a time threatened Moscow itself. These phenomena in the history of Russia were not new. Who has not read of the history of the successive pseudo-Dimitris, pretenders to the throne of the extinct Ruriks, in the beginning of the seventeenth century? Each of these pretenders claimed to be the youngest son of Ivan the Terrible. Others appeared as sons of his successor, Feodor, or of Czar Vasili Shuiski. The generalizing remarks of our author on this subject have a more than common interest, throwing light as they do on essential psychological conditions of the Russian nation, which are not characteristic of its past alone.

"The measure of our knowledge of the details in criminal cases of this kind is very uneven, but it is sufficient in most of them to convince us that we have to deal with a phenomenon of social pathology. It is the mass of the people which produces such adventurers, upon whom the pretender's rôle is not seldom forced. The thought of representing a deceased prince does not always spring from the head of the pretender himself. . . . That the in many instances very numerous adherents of such reputed tzarevitches, czars, and emperors were all believers in their genuineness, is not to be presumed. They identify themselves with the cause of such criminals, because various advantages are to be achieved under their banner. Wherever there are malcontents and oppressed such notions of pretendership obtain currency. Every rumor of the appearance of a reputed ruler, or reputed relative of a ruler, is hailed with satisfaction by the masses, because it awakens a hope of an improvement in their condition. Many rumors of this kind are without any foundation in fact. Where nobody was found to act the part of a pretender, a phantom of a pretender was invented, and by this alone the desired effect was produced. Thus there was nobody among the hosts of the ill-famed robber Stenka Razin (1668-71) to assume actively the rôle of the former Patriarch Nicon, but the pointing at a boat said to carry that church dignitary was sufficient to inflame the imagination of the people, who sympathized with the exalted state convict, and to incite them to a struggle against the reigning order of things. . . .

"Such occurrences offer eloquent testimony of the misery and barbarism, the sufferings and struggles, of the people. They afford us an insight into the difficulties inseparable from a state of transition, like that involved in the transmutation of Russia from an Asiatic into a European realm. They speak loudly of the oppression of the masses through unscrupulous, corrupt, and greedy officials. They tell of the fatality of the peasant question, solved only in the most recent time. They reflect the nomadic, Cossack-like ways of the migratory, labor-shunning bulk of the people; the savageness of the alien races; the narrow-mindedness of the sectarians; the despair of the deserters from the army, and of the runaways from transported gangs of robbers and murderers. They make clear the historical significance of the want of a regular and normal order of succession, resting on a fundamental state basis. They illustrate the demoralizing effect naturally produced on the mind of the masses by convulsing crises in the history of the state, like the *coup d'état* in the summer of 1762, or by such deeds of violence as were then perpetrated in Ropsha, and in 1764 in Schlüsselburg."

The descriptions of suffering, maladministration, and revenge, which form a part of the comment to these generalizations, are harrowing in the extreme, though the author is averse to dwelling upon horrors. The crimes perpetrated by Pugatcheff and his revolted bands were in strict proportion to the crimes of the nobility and Government which drove the brutalized peasantry to desperation and fierce rebellion; and the unsparing cruelty with which the rebellion was chastised corresponded to the fear and fury with which it had filled the rulers. Catharine, whose mainspring of action was vanity, felt humbled by this terrible unmasking before Europe of the real condition of things in her Empire, which she pretended to rule with the wisdom and humanity of a Marcus Aurelius, and the Arcadian felicity of which her Derzhavin had just been singing in pompous strains. During the course of the insurrection she was constantly urging on her generals to hasten the suppression of a movement which put her to shame before the world. To Voltaire, however, she wrote in a jocose manner about it, representing it as a petty affair, soon to be finished with the hanging of Pugatcheff, exaggerating the victories of her commanders, and belittling the rebel thief as "un sot ivrogne." In the same vein she wrote to her regular correspondent, Grimm, mocking "le marquis Pougatcheff," and predicting the speedy ending of the "farce" in floggings and a few executions. When she wrote thus, the knout and the gibbet were already in active requisition, but the end of the affair was still very far off. The scene of the "farce" was shifted from the banks of the river Ural to those of the Volga, and beyond this river westward. In Moscow, where the populace sympathized with the false Peter, extraordinary measures had to be taken to guard against an outbreak—measures which remind us of the preventives used in the same metropolis in our days against Nihilism. And there is, in fact, no little intrinsic resemblance between the spirit which pervaded the rebellious movements of 1773-74 and the destructive revolutionism of a hundred years later.

But Catharine was as fortunate in dealing with rebellion, pretendership, and conspiracy, with all domestic and foreign foes, as was Elizabeth of England, whom she also equalled, or surpassed, in energy, activity, knowledge, circumspection, cool self-possession, vanity, selfishness, and falsehood. In temper she was by far the superior of the English Queen. She was never cruel from rancor or jealousy, she was generally cheerful and inclined to merriment, fond of amusement and luxury, plain and affable, kind and complacent to all who surrounded her, and immeasurably lavish toward her favorites. In voluptuousness she was almost the equal of the Russian Elizabeth; in this respect she knew no hypocrisy. Her court, with its long succession of lovers *en ordre*, was a dazzling school of immorality. Potemkin for years ruled the Empire, and almost ruled her. She passionately mourned the loss of Lanskoi, resigned Mamonoff to a rival, and chose in Zuboff a lover forty years her junior. She used Poniatowski, whom she had placed on the throne of Poland, as an instrument in his old age for the destruction of that country's independence. At that time she had ceased to be a reformer, a liberal lawgiver, emulous of the glory of Frederick the Great. The French Revolution disgusted her with ideas of freedom and equality. Its successes enraged her, provoking her to flippant utterances on current events entirely unworthy of her wit and sagacity. A conquering Semiramis she remained to the end. Her son Paul she treated as the Semiramis of Nineveh is related to have treated her Ninyas. She seems to have expected her grandson Alexander to succeed her; in his brother Constantine she saw a future Byzantine Emperor. She was fond of both, and wrote books for their instruction. She died of apoplexy, and Paul succeeded her—soon to die as her husband did. Long before her death she had composed the following epitaph for herself—a very flattering one, indeed:

"Here rests Catharine II., born in Stettin on April 21 (May 2), 1729. In the year 1744 she went to Russia to marry Peter III. At the age of fourteen she resolved on this triple task: to please her consort, Elizabeth, and the nation. She omitted nothing in striving for this object. Eighteen years of *ennui* and solitude induced her to devote herself to voluminous reading. Having ascended the Russian throne, she made the good her aim, and strove to give her subjects happiness, freedom, and wealth. She was ready to pardon, and hated nobody; she was forbearing, easy-going, of serene disposition; she had a republican soul and a kind heart; she possessed friends; work was easy to her, and the arts gave her pleasure."

AMONG THE CANNIBALS.

Camping among Cannibals. By Alfred St. Johnston. London and New York: Macmillan & Co. 1883.

THE reader who opens 'Camping among Cannibals' at the beginning and follows the narrative in its course, may be pardoned if he wonders for a time what it was the author saw in his travels to suggest or justify the title he has chosen. The first and larger portion of the book, far from gratifying any bloodthirsty curiosity which the title-page may have awakened, presents a view of South Sea Island life so bright and rosy, and so altogether lovely, that one begins almost to share the enthusiasm of the author, who, having been taught in his tender youth to thank the Lord in a hymn that he was "born an English child," is ready, after visiting Tongatabu, to take it all back and wish he had "been born a Pacific Island one."

Few voyagers who have written books about the South Seas have been so completely captivated by the charms of that far-away island life as Mr. Alfred St. Johnston appears to have been during his visit to the Friendly and Samoan groups. For him it is a hopeless task to try to describe even a tithe of the beauties of these glorious islands. Words are absolutely inadequate to tell of their beauty of land, or sea, or sky. Everything is gorgeous. There is a rapturous intoxication in the very air one breathes, a sense of beauty everywhere around in earth and sea and air, that cannot possibly be described with pen and ink. He finds for the first time in his life an absolute and perfect satisfaction of his sense of color. He tells us of the soft green turf; the groves of orange trees, covered with glossy foliage and loaded with golden fruit; the coco-palms, lifting their slender stems aloft and waving gracefully their feathery branches; the crimson hybiscus, making glowing spots of color amid the shade, and the white gardenias, with whose perfume the

air is heavy, and about which large purple butterflies float languidly; of the bright surf, breaking gently upon the coral shore; the placid sea beyond, in whose clear depths strange zoöphytic forms, waving their fringes of tentacles of every gorgeous hue, bloom like ocean-flowers with wonderful tints of rose and gold and blue and purple, among which the shining and elusive fish flit in and out of mimic caves and grottoes as bright as they; of the cool of the evening, delicious after the heat of the day, when the beating of the surf upon the reef is heard with greater distinctness in the silence of the night, and the stars shine with golden radiance in the deep blue of the sky, while here and there a light shines softly through the palms, and now and then dim figures, white-robed, move hand in hand, idyllic. In this poetic, if not tropical, language the author strives vainly, as he thinks, to convey his impressions of a South Pacific paradise, coming at last to the conclusion that he has really found "the most exquisitely lovely place on the whole of God's great earth."

If the islands are lovely, the islanders are still more so. The men are charming, the women delightful:

"They are muscular, cheerful looking, and well fed; and their features are, I think, much better than the English average, being in many cases regular and fine. The nose may be rather broad at the base, but it is frequently well cut; the mouth is large and the lips a trifle full, but the teeth they disclose are strong, and white, and even, and their eyes are dark and lustrous. The women of Tonga have, I verily believe, the most beautiful eyes in the world, and they know how to use them, too Liquid, soft, and speaking, they glance through the fringe of their silken lashes in a manner that is indescribably sweet. Their dress consists of a cloth, fastened round the waist, which hangs down below the knees; the body has no covering, and they go bareheaded. The missionaries, with their usual idiotic interference, have tried to alter this sensible dress, which is decent, even according to our artificial notions of modesty, and most admirably suited to the climate. They insist on the women wearing a sort of absurd pinafore, which is left off on every possible occasion; and some time ago a law was made that every man should wear a European dress of shirt and trousers, and leave off the charming *vala*. To enforce this iniquitous law, the manufacture of *tappa*, the native made cloth, was prohibited, so that perforce the natives had to purchase European fabrics—a thing very greatly to the advantage of the traders, through whose influence with the Minister this disgraceful state of affairs was brought about. But even the worm will turn, and this was too much for the gentle Tongan, and the law has wisely been repealed by the king.

"To such an extreme was the enforcement of this act carried, that any man seen without trousers and shirt on the turf road in Nakualofa was liable to a fine of many dollars. It seems a queer state of affairs that a man cannot walk along the very road his ancestors made, in the dress of his country, but must don the hideous garments of an intruding people. In the church at Tongatabu, where the intelligent missionary of course rules supreme, this ordinance, which forbids any man to attend the service except he comes in European costume, is still enforced. It is perhaps needless to say that the women have to wear bonnets or hats, because St. Paul said that in his opinion it was seemly for a woman to have her head covered; so these poor creatures have to discard their wreaths and natural flowers, and stick on their heads bonnets or hats adorned with feathers and artificial flowers, like any factory hand in England."

Mr. St. Johnston frequently loses his patience with the missionaries, and the more so because he seems to think that it would have been better for the islanders as a race "to have remained in their old heathen faith, which, superstitious though it was, still was good and pure enough to make brave and courageous gentlemen not afraid to die, and women with a kindliness and generosity greater than our own." They believed "that all rewards for virtue and punishments for vice come in this world, and that human virtue consisted in paying respect to the gods, nobles, and aged persons, in defending one's rights, in honor, justice, patriotism, friendship, meekness, modesty, fidelity of married women, parental and filial love, observance of religious ceremonies; in forbearance of temper and patience in suffering. Surely a good enough creed. It will be said that we teach them the beauty of self-denial and unselfishness. Why, no Tongan, however hungry or small his meal, would *think* of refusing to share it with another; and unselfishness was so general that it could not be thought a virtue. When Mariner lived with them it was a saying, 'As selfish as a *Papalagi*'" (foreigner).

The writer of this philo-pagan volume is an Englishman—"a grovelling Englishman" he calls himself, in one of his moments of repining that he was thus born when he might have been a Tongan. A cruise among the South Pacific Islands had been the fondest dream of his youth; and finding himself in New Zealand, he seized the occasion to realize the wish of his boyhood by going as passenger in a little schooner, the *Caledonia*, bound on a trading voyage to Tongatabu and the Samoan group. It was thus that he spent some happy weeks among the Friendly and Navigators' Islands before arriving at Fiji, the stronghold of cannibalism, where he entered upon that chapter of his experience which gives his book its title.

Levuka, the capital of Fiji, is on Ovalau, one of the smaller islands of the group. It is a pretty place, with wooden houses and beautiful shrubberies.

"I was rather disappointed," says the author, "to find the place so large and civilized; but I am told that I have only to go into Colo, in the mountainous interior of Viti Levu, where I can see real savage Fijians, and where I can still run an excellent chance of being eaten. This year's *Australian Handbook* says that 'To-day finds six-sevenths of the Fijians professing Christianity, cannibalism has ceased since 1854, polygamy is abolished, and the idol worship of past ages has given place to the worship of the true God, and generally there is peace. Many of the converts are said to maintain a consistent walk; and in all a great revolution, in outward morals at least, has taken place, even if there has not been a real change of heart. *These remarks scarcely apply, however, to the tribes of the interior of Viti Levu, who are variously estimated at from* 7,000 *to* 20,000, *and have hitherto held out against any advance of civilization into their country.*'"

It was to see these unregenerate tribes of Colo, in the interior of Viti Levu, that the author soon conceived the idea of making a pedestrian journey across the island; and the latter portion of his book contains a very interesting account of his personal experience among the late cannibals. The Fiji Islands generally are under English rule, by reason of the sale, or cession, or other agreement made by the late native sovereign, Thakombau; but the natives of the Colo district, denying Thakombau's rights in their territory, and claiming independence, have occasionally required the exercise of force. The district, Mr. St. Johnston says, contains no white people, and none are permitted even to enter there without permission of Government, on account of the unsettled and frequently disturbed relations between the natives and the whites. This permission the author obtained, and, having left Levuka by boat, landed, three or four days later, on the island of Viti Levu, at Nadi, the starting point of his inland journey. Nadi he found a pleasant, peaceful place, although, less than five years before, the mountain people had made a descent upon it and killed and eaten many of the white residents. Thence, accompanied by a native guide, the pedestrian went in three days to Natuatuacoko, a fortified village, where he found an English officer in command of a native force or garrison of eighty-five men, who are kept here to suppress any signs of insurrection. Here he tarried some days, his countryman's guest, and then again set out with two native guides on his way across the mountains, arriving, after a six-days' tramp, at the junction of the Wai-namala and Wai-ni-buka Rivers, whence, by canoe, he found his way to the white settlements on the Rewa, and thence, by a little steamer, back to Levuka.

During his inland journey he found himself an object of much curiosity; but, although the people are less amiable than the Friendly Tongans and Samoans, they were, with rare exceptions, kind and peaceable. Only on one occasion, at Nivudini, were Mr. St. Johnston's apprehensions for his personal safety seriously aroused, and evidently shared by his guides, at whose instance he, with them, adroitly managed to take French leave of his hungry host, who had shown rather too plainly his desire to make a feast of the Englishman. Concerning the practice of cannibalism, Mr. St. Johnston gives many details.

"Many people," he says, "have totally denied the fact of cannibalism having ever existed; they should stay here for a short time in Fiji, and hear some of the stories of the early settlers, and their opinion would soon alter. It appears that the Fijian loved human flesh for its own sake, and did not merely eat a slain enemy out of revenge, as some people have thought; although I think that very probably the absence of any animal that they could eat gave rise to the custom. The crew of every canoe or boat that was wrecked upon their shores was killed and eaten in some parts until the very last few years; and often a great man would order to be clubbed some man or woman that he considered would be good for cooking, his plea being that his 'black tooth ached,' and only human flesh could cure it. . . . So delicious was human flesh considered, that the highest praise that they could give to other food was to say, 'It is as good as *bakolo*' (a human body to be eaten). . . . I am just as sure, too, that cannibalism is not yet a thing of the past, up here, as one is led to believe it is in the greater part of Fiji; the taste for it still exists, and the taste is gratified, I doubt not, when occasion serves. Four years ago, and probably three, it was a regular and acknowledged thing in the mountains."

In fact, upon his return to Levuka the author was warmly welcomed by his friends, whose fears for his safety had been roused during his absence by news, just brought down from Nadi, that a man had been killed and eaten in Colo, leaving them in serious apprehension lest Mr. St. Johnston himself had been the victim. On the subject of cannibalism the author speaks somewhat more graciously about the missionaries than in the paragraphs already cited.

"Such things were of frequent occurrence when the first English missionaries settled here, and I must say a good word for those early Christian workers, who certainly did do a great work in a land given over to such horrors as no one who has not been here and heard the stories of eye-witnesses would believe. They fought against and conquered the deepest-seated habits and customs of a savage people, and although their teachings were perhaps not all that one could have wished for in breadth and freedom, still to have made the greater part of a large and brutal population peaceful and civilized is no small thing. The story of how the wives of two of the missionaries, when their husbands were absent, bearing their very lives in their hands, forced an entrance to the house of an unfriendly chief, and, at the utmost risk of their own, saved the lives of several out of fourteen women who were being slaughtered for the oven, makes one's heart beat quicker for the hearing even now, years after."

Mr. St. Johnston's book is generally very pleasant reading. Its style is that of a journal or current record of observations and comments A small map or chart of these one of the writer's journey would have been a valuable addition for an interested reader. There is occasionally some negligent orthography which

ought not to have escaped correction, as, for example, "decern" for discern (p. 116), "scarves" for scarfs (p. 123). In the closing chapter the author gives expression to a feeling of sorrow that the Polynesian race is fast approaching extinction.

"Sad though it be, yet true it is, that everywhere in Polynesia and Australasia where the white man has possession the same tale is told; each census taken shows a less return. In Australia a few years hence—a very few—there will be no aborigine; in Tasmania the work is already done; in New Zealand the noble Maori lingers yet, but as civilization gradually creeps into his last fastnesses, consumption and other ills unknown before creep with it too, and a few generations hence, should nothing be done to stay it, his race will be as extinct as the dodo or his own gigantic *moa*. From Tahiti and the Sandwich Islands, from the north and from the south, the same tale comes; it seems as though the race were doomed. Though our exertions are for their prosperity—though we legislate for them as for ourselves, though we teach them, educate them, or what we will—the very presence of the white man seems fatal to the brown."

There is naturally something in this to touch a tender feeling of regret. Nevertheless, without being a misanthrope, one may prefer to reserve his sympathy for the millions of human kind who must needs be born to suffer in civilization, rather than expend it upon unborn heathen—and especially heathen whose native grace and charm, if we agree with Mr. St. Johnston, must soon fade away entirely before the combined influence of the foreign trader and Christian missionary.

PHILOSOPHY, THEOLOGY, AND EDUCATION.

The Law of Heredity: a Study of the Cause of Variation and the Origin of Living Organisms. By W. K. Brooks, Associate in Biology in Johns Hopkins University. Baltimore: John Murphy & Co. 1883. Pp. 336.

Creeds of the Day; or, Collated Opinions of Reputable Thinkers. By Henry Coke. London: Trübner & Co. 1883. Two vols., pp. 302 and 324.

Body and Will: being an Essay concerning Will in its Metaphysical, Physiological, and Pathological Aspects. By Henry Maudsley, M.D. D. Appleton & Co. 1884. Pp. 337.

A Critical History of Philosophy. By Rev. Asa Mahan, D D., LL D. Phillips & Hunt. Two vols., pp. 435, pp. 431.

An Examination of the Philosophy of the Unknowable, as Expounded by Herbert Spencer. By William M. Lacy. Philadelphia: B. F. Lacy. 1883. Pp. 235.

Religious Duty. By Frances Power Cobbe. Boston: G. H. Ellis. 1883. Pp. 311.

L'Instruction Publique en France et les Écoles Américaines. Par Marie-Casimir Ladreyt. Paris: Hetzel; New York: F. W. Christern. 1884. Pp. 378.

L'Évolution Religieuse Contemporaine, chez les Anglais, les Américains, et les Hindous. Par le Comte Goblet d'Alviella. Paris. New York: F. W. Christern. 1884. Pp. 430.

Dr. Brooks begins by an extended history of the theories of heredity from Bonnet and Haller down to our own times, and thus develops what he terms a new theory of heredity midway between Darwin and Lamarckians like Semper. He denies that either sexual element may transmit any characters whatever: neither crossing, the homology between the ovum and the male cell, the latent transmission of secondary sexual characters, reversion, nor alternation of generations proves this, and each may be interpreted in accord with the author's hypothesis that the male and female elements are unlike in function, and are specialized in different directions. After detailing the evidence from hybrids, variation, secondary sexual characters, the author finds the conclusive argument for his theory in the intellectual difference between men and women. Men represent the law of variation, adaptation to conditions, and the modifiable elements generally in the human species; while the female organism stands for heredity and conservatism, and is a storehouse for the instincts, habits, intuitions, and laws of conduct gained by past experience. Men thus excel in power to discover the manner in which new external relations shall be met and provided for by new adjustments, so that where feelings and experience furnish no guide man's judgment is best. This difference is the culmination of physiological differences of sex, from the lowest animal life up.

Mr. Coke's problem is how to determine the fixed basis of religious sentiment, and how to gain from it reasonable expression and satisfaction. After an exhaustive discussion of the new criticism of the Old Testament, the author concludes that its religion has no special claim to reverence, but must take its place as a fractional phenomenon in the vast integral of civilization. The New Testament is a product of essenism, the nearest kin to which was the religion of Buddha, and fails to give us God or immortality. Indeed, says the writer, we cannot see the grandeur of the character of Jesus till we penetrate the glamour of his divinity and see his intense humanity in its defects as well as its greatness. Rational theology, which is pursued through evolutionary literature, compels the conviction that it is impossible to think that thought had a beginning, or that eternal thought is made up by a process of finite evolutions of thought. In other words, spirit is indestructible and unceasingly active from eternity to eternity, and sets in death only (like the sun) to shine on forever. Finally, Transcendental theology teaches that the order of nature is not the only or absolute order, so that to believe in a metaphysics is, as Schopenhauer is quoted as saying, the necessary creed of all the just and good. Metaphysics is poetry needful to offset the pessimism which arises from too close acquaintance with reality. This world it is the glory of Kant to have established, though he did not make it clear. Whatever may be thought of the conclusions of this book, its style will fascinate all who read it.

No one can accuse Dr. Maudsley of lacking boldness, least of all when he attempts to storm the metaphysical stronghold of free will. Self-consciousness deceives us because it illuminates results rather than causes, and hence the will seems undetermined. We think ourselves free because we feel the effort and the satisfaction following it; and were the effort always effective, consciousness would be extinguished. The volume is made up mainly of illustrations of the compelling nature of morbid physical pressure on the actions of the will, and an account of its evolution. Sociology, religious history, metaphysics, are all drawn upon in an interesting, readable way, and a most useful suggestion is reiterated that psychology must advance by the careful and detailed study of individual cases; but here, as in his other books, the author fails to come into very close quarters with his subject. His style is loose, and he crowds into his pages apparently all the stray information lying about in his mind. The contrast between this and the careful, exact statements of German alienists is the greatest possible.

Dr. Mahan has written perhaps the most comprehensive history of philosophy in any language. From a discussion of the "origin, genesis, and character of all actual and conceivable systems of philosophy," he passes to the Hindu philosophy, and thence through Chinese, Persian, and Egyptian systems to the Greeks, the early and later Christians, the mediæval, the English, German writers, and on to Spencer. Hegelism is characterized as "monstrous," "absolutely impossible of representation," "the most lawless conceivable," and it is said that neither Hegel nor any other thinker ever did or can believe it. Spencer's evolutionism and physiological materialism are no better. In the last few pages the author prophesies "the future of these godless philosophers." The whole is preceded by a critique of the human faculties, and the book throughout is pervaded by such a spirit of absolute certainty and finality that, with sufficient faith in the author's infallibility, the reader will have little further doubt respecting the deepest problems that have hitherto vexed speculative minds.

The books examining or refuting Herbert Spencer now make an imposing library. That agnosticism can never be proved, as Mr. Lacy first argues, we believe Mr. Spencer himself would fully admit, for it is only a postulate in his system, and he has admitted that it is more logical to say the Unknown than the Unknowable. This book is a very favorable specimen of its class, and ends with the usual reconciliation between science and religion. Nothing could be a better discipline for a student of philosophy than to write so careful and methodic a book, but we have read a great part of it without finding anything essentially new upon the vexed question to which it is addressed.

Miss Cobbe's little book now reprinted is, to our thinking, about the most helpful to the average reader that she has written. That sacrilege, perjury, hypocrisy, persecution, etc., are distinctly religious, as contrasted with moral, offences, no one would nowadays assert, but religious duties, such as adoration, prayer, faith, self-consecration, are far more distinct from those of a moral nature. On the basis of theism to which she so ardently holds, the religious duties and offences become very real, and, with the somewhat psychological interpretation she so happily suggests, very natural.

In January, 1880, the eminent philanthropist, M. Isaac Pereire, offered 100,000 francs to be divided into four series of prizes, for the best treatises on four topics, one of which was, "Better systems of education in all grades." From among 800 memoirs, that of Madame Ladreyt was one of twenty awarded a prize by a jury of fourteen public men. The greater part of the book is devoted to American systems, from primary to professional, and with some description of several of the larger Eastern institutions from personal observation. Amherst, Harvard, Johns Hopkins, and several colleges and universities are sketched in a rapid, tactful, and surprisingly correct way for a foreign lady (of American birth, to be sure), and the book must be very instructive to her countrymen, to whom, till the report of the French Commission in 1876, almost nothing was known of our educational system.

The last volume on our list is divided into three parts, which treat of religious progress in England, the United States, and India respectively. Of the details of present religious work in this country and England, and, we judge, in India also, the author possesses surprising knowledge. His sympathies are very liberal, and the book is written and printed in admirable style.

A SCIENTIFIC STANDARD OF GRAIN VALUES.

A Bushel of Corn. By A. Stephen Wilson, author of 'The Botany of Three Historical Records,' 'The Unity of Matter,' etc., etc. Edinburgh: David Douglas. 1883.

No human institutions have been more enduring than the simple standards of weight and measure by which the daily commerce of the race is ruled The "propensity to truck, barter, or exchange," which, as Adam Smith says, is common to all men and to be found in no other race of animals, requires these standards as the condition of its exercise. Every sale is the result of a comparison of estimates, and every comparison supposes a standard. The "value" with which economists are principally concerned is value in exchange; a thing is worth what it will fetch of something else. But, logically, the "intrinsic" value, or value in use, is prior to exchange value, and in the main determines it. What men seek by their traffic is chiefly to gratify their physical desires: they exchange bread for clothing and shelter; and it is plain that their exchanges will be fairest and most satisfactory when their standards of exchange show exactly what amount of the desired gratification is obtained by each party. Mr. Wilson's investigation is directed to showing how far this desirable end is attained by the standards used in the most important of all branches of trade—the traffic in those grains which constitute the principal food of mankind. Any error or uncertainty here is attended with such immense and far-reaching results, that its detection is a very material benefit to the race; and a careful examination of this book has convinced us that the author has earned the praise that is given to him that makes two blades of grass grow where but one grew before.

Although not necessary to his purpose, Mr. Wilson cannot resist devoting his introductory chapter to a short but very learned and very interesting history of the bushel measure. His researches show that the imperial bushel established in 1825 was simply a return to old Roman standards, which, although often proscribed by law, had never ceased to be generally used. The English pint was the Roman sextar, and the Scots pint was three sextars. Avoirdupois weight, or tron weight, was the Roman weight and the old weight of England. Troy weight (a half-translation of the Norman *droit pois*, as shown by the forms *trois weight*, *troi weight*) represents the attempt of the Normans to force their standards upon the English—an attempt which succeeded as to the precious metals, but which entirely failed to affect the daily transactions of the common people. It appears from Fleta that the bulk of eight pounds of wheat was equal to a gallon. A pint of wheat therefore weighed a pound; and when the existing imperial standards were under consideration, and it was resolved to make the gallon equal in bulk to ten pounds of water, it brought the pint back to the old Roman standard of twenty avoirdupois ounces. This reasoning is confirmed by the fact that the Scots measures recognized in 1618 correspond closely with the modern English standards; and the "imperial measures" are thus unwittingly the measures of imperial Rome.

With enormous labor, the results of which are given in elaborate tables, the author next proceeds to consider how far the process of measuring can be relied upon as indicating the weight of grain. We can state only a few of the more important of his conclusions. In the first place, a shallow bushel-measure, although it holds the same weight of water, holds a less weight of grain than a deep bushel, grain being an easily compressible substance. For the same reason, when grain is pressed down and shaken in measuring, a bushel will contain a greater weight than when the grain is gently sifted into the measure. There are differences in the weight of the same crop of grain in different months, and much more serious differences in the weight of the crops of different years. Thus, in a term of thirteen years, it is found that the quarter (eight bushels) of wheat varies in weight some 26 pounds, the quarter of barley some 32 pounds, and that of oats some 18 pounds. These are the differences between the average weights of these grains in different years; in particular cases they rise to 88 pounds for wheat, 112 pounds for barley, and 120 pounds for oats. Again, the measure-weight of grain depends to a considerable extent upon the kind of dressing that it receives.

"If a stack of barley is thrashed with the flail, the weight of the bushel may be 50 pounds; if thrashed with an ordinary farm machine, the weight may be 53 pounds; if hard thrashed with steam machinery, the weight may be 56 or 58 pounds. There can be no doubt that since the introduction of thrashing machinery a quarter of barley has advanced in alimentary value much beyond its ancient standard. This advance is probably not overstated at 8 or 10 per cent., and is an economic fact affecting the proper comparison of ancient and modern prices."

It is commonly supposed that the drier a stock of grain is, the heavier will a bushel of it weigh. Mr. Wilson's experiments show that this is a mistake. When grain has been wet and then dried, although its alimentary quality may be unaffected, the weight of a bushel will be diminished. The seeds are swollen by the water, and as a spiral spring of soft wire when overdrawn never regains its original compactness, so a grain of wheat remains permanently larger after the water has been expelled. An order for barley of 58 pounds the bushel might be executed with a stock containing either 15 per cent. or 37 per cent. of water. In the author's opinion the uncertain element of moisture has spoiled more of the miller's calculations than all the variations of quality put together. It appears, therefore, that weight, although more satisfactory than measure, by no means affords a trustworthy standard of the alimentary quality of grains. When the varieties of the different grains are considered, these uncertainties become still more serious.

With a view to establish more definite conclusions than at present exist as to the relative percentages of meal or kernel to be found in the different varieties of oats, Mr. Wilson has examined about fifty of these varieties, and decorticated about 200,000 seeds. In this labor he decorticated also his thumbs, wore out two brass pincers, and was obliged to fall back upon those of steel. The form of the grain and the character of the husk are the principal causes of the difference between the measure-weights of different varieties. This is very well shown by illustrations representing Canadian and White Tartarian oats lying in their ordinary state of compactness in boxes with glass fronts. The form of the Canadian seed enables it to fill the measure solidly, while the form of the Tartarian is such as to leave much space vacant. Hence the Canadian oat weighs 50 pounds to the bushel, and the Tartarian only 38 pounds. Nevertheless, the percentage of kernel is about the same in both. In fact, the Canadian oat has the highest measure-weight and the lowest percentage of kernel of all the samples.

It might seem that the results obtained by Mr. Wilson, although of scientific interest, depend upon such tedious and difficult experiments that farmers and millers cannot afford to follow him. This, however, is far from being the case, as he is at the pains to point out how, by the exercise of a very little judgment, any one may ascertain quite definitely the alimentary value of any sample of grain. He has also constructed some tables of "equivalents" which can be used by any intelligent farmer. The following example illustrates their use, and at the same time indicates the conditions that must be taken into account in any careful estimate of grain. Supposing that a producer has thrashed out two fields of oats, one of the Pedigree Canadian variety, the other of the Pedigree Potato variety.

"In each case the acre has produced 6 quarters, but while the Canadian weighs 50 pounds the bushel, the Potato weighs only 44 pounds. Now, while he does not believe much in this difference as a test of quality, he is bound to believe in it as a test of quantity; and throwing both acres into centals, the Canadian presents 24.00 and the Potato 21.12. Both are found to contain 15 per cent. of moisture; and the Canadian shows 67 per cent. of kernel, while the Potato shows 75½. Looking at the proper junctions in the table, he finds that 113.26 of Canadian are equal to 100.50 of Potato; and, dividing 24.00 centals by 113.26, he finds the Canadian equal to 21.19 standard units—both crops, so far as meal is concerned, being practically the same—the 2,400 pounds of Canadian being no better than 2,112 pounds of Potato."

The quantity of grain dealt in in the great markets is now so vast that the aggregate results of the errors and imperfections of the present methods of estimating values are extremely formidable. We commend this book to the careful consideration of those agriculturists who believe that there is a science of farming, and of those dealers who expect to prosper not by speculating in "futures," but by furnishing their customers with the best that the market affords.

Silvia Dubois (now 116 yers old): a Biografy of the Slav who Whipt her Mistres and Gand her Fredom. By C. W. Larison, M.D. Ringos, N. J.: The Author. 1883.

BIOGRAPHIES of Northern slaves are rare. Except the one before us, we recall no other besides Sojourner Truth's, a New York bondwoman, the "Isabella" of the Matthias imposture. As this remarkable person approached her end, her age became so elastic as to surpass a century, though she certainly never came within ten years of it. The birth year of Silvia Dubois, on the other hand, seems pretty well established, by tradition and record, and we are disposed to believe Dr. Larison when he says, of her sitting for her picture at his request and charge—

"It is not likly that so old a woman has ever befor set for a fotograf; and it is not likly that so old a wun wil ever present her faç to the artist's camera. Imediatly after taking the negativ for Silvia's pictur the artist adjusted the camera to the faç ov Elizabeth, the yungest dater and constant companyun ov our heroin, Thus a woman in the 78th yer ov her ag, and her muther in the 116th yer ov [her] ag, wer fotograft on the same da."

Personally, her age is the chief interest which attaches to Silvia. She is a common old woman, living in a wild and vicious neighborhood, and her talk is seasoned with vulgarity. Dr. Larison took it down in shorthand, and reproduces it correctly as to facts, but with discrimination as to phraseology, omitting here for decency, and retaining there for artistic effect.

"The narrativ abounds in profanity," he says, "an element that is foren to me, and wun that I most cordyaly despis, and sincerly deprecat. But Silvia is a profan negres; her langwag alwas abounds in profanity; and, ters and forcibl as it is, castigat it ov its profan wurds and it is flat and meningles, and uterly fals to conva the idea intended, or to revel her caracter. In the narativ, my am is mor to sho the caracter, forç and spirit ov independenç ov the heroin, than to mak out a long lin ov yers, or to tel with hom she dwelt. To accomplish this, I must us thos wurds and frases peculiar to herself, hwich alon ar adequat to the task befor me."

With much humor the author expatiates afterwards upon "Silvia's familiarity with the titls with hwich Jehova is wunt to be adrest," and her "by no mens limited noledg ov that uther being cald the Devil"; but, as we have said, he is judicious, and not offensive in his reporting. The narrative has undoubted value as a picture of slave and non-slave life, of popular customs and manners, both in New Jersey and in Pennsylvania, in the early years of the Republic. The singular part of it is that the feat here celebrated, of Silvia's having turned upon her mistress—which, as recently as a quarter of a century ago, would have been judged, even at the North, outrageous and San Domingoish—was condoned with freedom by her master. Very likely his relations to his slave were such as to instigate his wife's cruelty towards her, which was that of "the very devil himself." When, before this event, Silvia sought to escape the consequences of getting drunk by feigning colic, her mistress, in much alarm, deserted her "big cumpany," and placed the girl on a trundle-bed in her own room:

"I cashusly squrmed around to se wether enybody was about, and thar sat misy, faning me. I cashusly opend my ys [eyes] just the lest bit, to se hou she lokt; she lokt very pityful. I was to drunk to laf; but 'My God,' thot I, 'if yu only neu hwat I am doing, yu'd thro that fan awa and giv me hel.'"

The journeyings to and from Silvia's looped cabin afford Dr. Larison a good opportunity of using his excellent descriptive powers, and at the close one may profess to be pretty well acquainted with the section of New Jersey surveyed. The orthography of the book is such as we have given samples of, minus the diacritic marks, for which our typographical resources are inadequate. The author is a reformer, who aims at the grand ideal—"hwen wun caracter wil reprezent but wun fon; and wun fon is represented by wun caracter." He prints the rules adopted by the Committee on the Reform of English spelling, but does not follow their advice in every particular, because he thinks it either not well founded or not practicable; and he says, correctly, in our opinion, "the abuv ruls, god as tha ar, if usd, wil mak an English orthografy very litl beter than the wun hitherto in us. Inded, to do much in the improvment ov English orthografy we must hav a beter alfabet." We need hardly expose the defects of his own. The desideratum is, first, a world phonetic alphabet, established by the consensus of the learned; then, reform strictly on the lines of this—progress being slow if need be, but *nulla vestigia retrorsum.*

If anything further were needed to make this little book a great curiosity, it would be the two woodcuts of the hut which the centenarian inhabits; especially if they are the domestic product of the "Academy of Scienç and Art" over which the author presides. Silvia's portrait is much better work, and is, indeed, good enough.

Memoir of Thurlow Weed. By his Grandson, Thurlow Weed Barnes. Boston: Houghton, Mifflin & Co. 1884.

In reviewing Mr. Weed's autobiography, to which this is a concluding volume, some regret was expressed that the autobiographer had been so reticent in regard to the inside history of New York politics, and particularly in regard to the birth, life, and tragic dissolution of the firm of Seward, Weed & Greeley. It seems to be the object of this memoir to fill up this and other similar gaps in the autobiography; and the work is done quite as satisfactorily as it could have been done by any second hand. Mr. Greeley long ago had his innings: his 'Recollections of a Busy Life' have already given the junior partner's version of the firm's vicissitudes. Now it is Mr. Weed's innings, and his representative certainly does some remarkable scoring for him. Even from Mr. Greeley's own point of view, it was a question whether he was of more service than mischief to the party which he honored with his support; from Mr. Barnes's point of view there is not even a question.

This volume will be as interesting to the generation which is now in active familiarity with American politics as the appearance of a living Eosaurus would be to the student of natural history. It is not merely that it is a memoir of a palæozoic politician, but that its author sympathizes so acutely with all the purposes, the methods, and the prejudices of his subject. It is interesting to read again this story of a time when political struggles were a passionate battle, when Weed could weep and Schoolcraft die of grief because Seward was not nominated at Chicago. It is interesting to study the mental workings of a trusted political guide, who could suggest the bringing about of resumption of specie payments by a forcible suppression of time bargains for gold, and that not by the comparatively gentle method of clapping the gold gamblers into jail for ninety days, but through the medium of vigilance committees and lynch law. It is interesting to trace, in the extracts from his articles and letters since 1867, the evolution of those two equally unanswerable objections to civil-service reform, that it "ignores the principle that, in a republican form of government, all the offices of the government should be within the reach of all its citizens," and that "the demand for life tenures in office conflicts with vital principles of our form of government." But we submit, with all deference to the author's rights of treatment, that it is simple cruelty to Mr. Weed's memory to saddle upon him the invention of the great "conundrum" objection to civil-service reform, and worse than cruelty to devote a whole page of fine print to the "conundrums" which aspirants to the civil service are required to answer. A judicious hand will draw the line somewhere, and the line might have been drawn here without sacrificing the truth to the interest of biography.

Thurlow Weed's political training, his fixed habits of political thought and action, compelled him to look with a sort of angry contempt on any effort to take the civil service out of politics. The power to dispose of the civil service seemed to him as vital to party organization as the commissariat is to an army; and he felt toward the civil-service reformer much as Sherman would have felt toward an officer who should have proposed to him to begin the march through Georgia with one day's provisions. The fact that he and men like him had always used the civil service, with military exactness, as means toward the attainment of ends which they meant for the country's good, unfitted him for gauging the increased damage and danger resulting from the use of the civil service by men with unqualifiedly selfish purposes. It was historically fitting and complete that in his old age he should bring the beginning and the ending of the spoils system into glaring contrast; that, at the last Republican Convention which he attended, the Saratoga Convention of 1876, he should run counter to the Conkling machine. He went, as he had always gone to such gatherings, to advise with others for the benefit of a party: he found a generation, the natural outgrowth of his own system, which cared more for the Machine leader and representative than for either party or principles. For him there was no longer even an affectation of courtesy. "Any attempt by Mr. Weed," said a newspaper of the time, "to outflank Mr. Conkling will be very roughly dealt with by very rough men." And yet it was to these "very rough men," the Jakes and Mikes and Barneys of city and country, that he continued to insist on intrusting the civil service, for fear a loss of "interest" in politics would result in the establishment of a monarchy.

The memoir is largely devoted, as is natural, to the numerous cases in which Mr. Weed exhibited his unusual acuteness in forecasting popular feeling, and in adjusting party tactics to fit it. All the space which the author has given to this part of his work is fully justified by the almost unbroken success of his subject: it was not often that Thurlow Weed assumed the responsibility for any such mare's nest as that in which the "Benjamin" letter was discovered. But there are numberless touches of character, brought out incidentally, which are needed to show even the present generation that Thurlow Weed was much more than a professional party manager; that those traits by which he acquired and retained his hold upon men were above and beyond party, and that he was always a man to be respected and loved as well as obeyed. It is impossible to read Mr. Greeley's childish letter dissolving the partnership in 1854, and Mr. Weed's dignified, temperate, and kindly reply to it, without understanding why offices were always at the service of the latter and always denied to the former. In spite of Thurlow Weed's notoriously lavish generosity to the unfortunate, there has always been in some minds a vague notion that he had used his quasi-public position to acquire that competence on which he retired years before his death. Of course, any one who has knowledge of the great returns from a successful newspaper enterprise, needs no further explanation of Mr. Weed's modest acquisitions. There may be others to whom such an explanation is necessary, and Mr. Weed has furnished it in his valedictory editorial in the semi-centennial issue of the Albany *Evening Journal:*

"When the *Journal* was established, and for several subsequent years, I gave my time and thoughts wholly to the advancement of our cause. Aware of my indifference to pecuniary matters, my friends Seward and Whittlesey looked after my worldly affairs. At the instance of those gentlemen, the proprietors of the *Journal* increased my salary as editor annually from $750 in 1830 to $2,000 in 1838. Subsequently, when the *Journal* became the State paper and I a partner, Mr. King kindly became my pecuniary guardian, taking the same care of my interests as of his own. Under his auspices, during the next twenty years, he saw, as he used to say with much gratification, 'the acorn grow into an oak.' It is to his devoted friendship that I am largely indebted for the competency which renders the evening of life free from toil and care."

It is but just to add that this volume closes with an index, covering both volumes, whose fulness and convenience are all that could be desired.

The Hessians, and the Other German Auxiliaries of Great Britain in the Revolutionary War. By Edward J. Lowell. Harper & Brothers. 1884.

This book shows a remarkable progress in the historical literature of the American Revolution. While the majority of works on that subject are of a rather sentimental character, Mr. Lowell shows a just appreciation of men and events, and represents them in the light and character of their time. As a people, we fancy that we pay our Revolutionary heroes a greater tribute of respect by divesting them of human attributes; and this idealizing has seriously impeded the comprehensive and critical investigation of the history of that period. Unqualified worship is always accompanied by equally unqualified condemnation,

and the poor vilified Hessians correspond to the apotheosized Continentals.

We are glad to state that Mr. Lowell's book does not belong to this order of historiography. He has done his best to present to the public a really trustworthy work, in creditable distinction from those who have treated the same subject in the English language. Apart from inferior writers like Abbott, Spencer, and schoolbook manufacturers, even so prominent and popular an author as Irving, in his 'Life of Washington,' gives a rather superficial sketch of the Hessians and their leading men, and tries to make the name of a brave and excellent soldier (although a bad commander), Colonel Rall, a laughing-stock for his readers, while he gives no idea of his importance and valor—as shown, for instance, at the storming of Fort Washington. Rall's aide-de-camp, Lieutenant Biel, was not at all a wag, either, as Mr. Irving states, and the whole episode appears to be inserted for the purpose of concealing the author's want of acquaintance with the pertinent facts.

German historians have written more judiciously on the Hessians. Friedrich Kapp, as early as the summer of 1856, first called attention to the subject in a paper read before the New York Historical Society, which forms the basis of his later work, 'Der Soldatenhandel Deutscher Fürsten nach Amerika (1775–1783).' He, however, would never have been able to write this book and publish it in two editions if he had not been assisted by Mr. Bancroft, who gave him access to his rich store of original documents, expressly copied from the London, Paris, and Berlin archives. Mr. Bancroft, so far as this subject entered into the plan of his work, has treated it with much care and gusto, and it is surprising that Mr. Lowell almost ignores these researches. Mr. Kapp, on the other hand, wrote with a single eye to a political purpose. He wished to rouse the hatred and contempt of the German Liberals against the successors of those petty dealers in human flesh, and in this he succeeded admirably, without, however, distorting or omitting historical facts from his narrative. Mr. Lowell has freely drawn from Kapp, but although on the whole fair in quoting his authorities, he on some important occasions omits to give him credit—as, for instance, for the characteristic letter written on October 24, 1777, by Frederick the Great to his nephew the Margrave of Anspach-Bayreuth, in which he forbids him to send his mercenaries through the Prussian dominions. This letter was discovered by Mr. Kapp in the Gemmingen Papers, and first published by him. In his political appreciation of the trade, Mr. Lowell stands on the shoulders of the German writer and of the authorities quoted by him. Or could Mr. Lowell have had access to K. H. Lang's writings, or to Schloezer's 'Briefwechsel' and 'Staatsanzeigen,' of which, so far as we know, only single copies can be found in all the libraries of the country? Besides these sources, our author avails himself of the writings of the late Colonel Eelking, which on some minor points are very good, but not quite accurate, especially where they treat of English reports, as Eelking did not understand a word of English. Mr. Lowell's merits as an historian chiefly consist in enlarging the space which the Hessians have thus far occupied in the eyes of American observers. He fills a gap, by not suffering them to disappear in the ranks of the British army after their landing in America, but, on the contrary, follows them in the history of the several corps, and in their participation in the different British engagements and expeditions. Eelking is inaccurate in this respect, and Kapp does not mention these reports, as he started from a different point of view. Mr. Lowell is always just and fair in his judgment, and combines sound historical training with an excellent style.

On some minor points, however, we cannot help finding fault with him. Hesse-Cassel had only 275,000 (instead of 300,000–400,000) inhabitants during the American war, and Brunswick only 150,000 inhabitants. Frederick William I. of Prussia was much better and of far greater importance than his daughter, the Margravine, represents him. Without him the success of Frederick the Great would not have been possible. Ranke and Carlyle are correct in this respect. Promotion from the ranks was as impossible at that time as it is now here, where only West-Pointers are made officers. The character of the majority of the rank and file in those times precluded the idea of bestowing commissions on the privates. Even to-day, in the German army, privates and sergeants cannot be promoted to officerships if they have not passed an examination, do not belong to good families, and have not, apart from their wages, a certain income. It is a pity that Mr. Lowell has not inserted the interesting narrative of Sergeant Doehla, an Anspacher, about the surrender of Yorktown, which he could have found in Kapp's English edition of the 'Life of Steuben' (N. Y. 1859, pp. 459–464).

In the way of new information Mr. Lowell has interwoven into his narrative twelve manuscripts, consisting of journals, letters, and reports written by Hessian or Waldeck officers and kept in the library of the Cassel estates. What he gives from the Marburg Papers is not new and is quite defective. He can never himself have been in that old university town, for if he had consulted its Provincial Archives, he would have found such rich stores of documentary evidence that several weeks' examination of them would not have sufficed. When Mr. Kapp published the first edition of his 'Soldatenhandel' he stated in its preface that he had been unable to gain access to the papers in question, for the reason that they had been secreted by the late Elector himself at the Castle of Wilhelmshöhe near Cassel. Since then the Hessian dynasty has ceased to reign, and the former Electorate now forms a part of a Prussian province; but, in spite of a thorough search for years, no papers could be discovered at Wilhelmshöhe. Dr. Koennecke, however, the able keeper of the Marburg Archives, several years after the annexation, was so fortunate as to find in an attic of the castle, among other important state papers, some thirty big volumes relating to the trade in soldiers. The greater and military part of them, indexed by Colonel von Sturmfeder, was sent to the library of the staff of the army in Berlin, where they still are; the smaller number is kept at Marburg. If Mr. Lowell had read the Berlin correspondence of the *Nation* of June 30, 1882 (in No. 892, August 3, 1882) he would have been able to do still more justice to his subject. The volumes now in the Marburg Archives not only contain the diplomatic negotiations of the Landgrave and of his Minister Schlieffen with the English Foreign Department, and the treaties founded thereon, but also every day's orders issued by the Landgrave to his generals and colonels in America and the letters written by him, the answers and reports on the condition and conduct of the troops, and well-drawn maps and sketches of the localities having relation to the Hessian movements. Three big volumes are filled with the proceedings before a court-martial on the capture of Trenton. The papers, now in Berlin, refer chiefly to the transactions of Hesse-Hanau with England. They give all the particulars about the financial transactions of the contracting parties. Another interesting part of these papers forms a collection of about a hundred letters written by officers to their relatives at home, who were directed by the Prince to send them to him for his perusal. They give some charming sketches of American society at the time, and the elegance of manners prevailing in the old colonial families. These letters bear the imprint of reality and truth, and are the more valuable as their writers, although enemies and foreigners, are involuntary witnesses and reporters of the real state of American life. All these documents ought to be copied and secured for a large American library. Apart from their military and historical importance, they are of the highest value for the future historian of the civilization and the social development of the United States.

Record of Family Faculties.—Life History Album. By Francis Galton, F.R.S. London and New York: Macmillan & Co. 1884.

THE word "heredity" is fast coming to be used in a loose sense not unlike that formerly given to "vitality." Many are confusing a biological law with an actual force, and this or that physical or mental trait is assigned to heredity as something not altogether understood, yet fully capable of explaining much that cannot be assigned to any other cause. From our former point of view, that man was to be considered and judged as an individual, the pendulum is swinging to the other extreme, that he is merely one link in a series involuntarily inheriting and transmitting a number of peculiarities. The ethics of a general belief of this kind would make men more lenient in judging themselves, while it would increase their sense of responsibility to their descendants—two rather diverse influences. The whole personal interest of this question can be resolved into this: What have I received from, what can I give to, the line to which I belong? In 'Hereditary Genius,' Mr. Galton gave us the mathematics of the answer, but stopped far short of bringing the science to what is known as the test of prediction. If, as he anticipates in the investigation proposed in the works before us, this gap can in some degree be lessened, we may be able to "foresee much of the latent capacities of a child in mind and body, of the probabilities of his future health and longevity, and of his tendencies to special forms of disease by a knowledge of his ancestral precedents."

The long experience of Mr. Galton as a statistician is here very evident. The 'Life History Album' is designed for the minute biological data of a single lifetime, just as the 'Record of Family Faculties' is for a comprehensive collection of family data. In principle they are alike. Mr. Galton edits the former as Chairman of a Sub-Committee of the British Medical Association. It is most ingeniously planned for the annual registration of life and medical history and anthropometric measurements, such as acuteness of the senses, strength tests, changes in hair and eyes, etc., occasional photographs, and a record of marriage and children. Upon stature and weight-charts you may compare each year of your growth with curves representing the English average, and here you may also see the temporary or permanent deflections caused by illnesses. Reaching your physical and mental climax, you record your progress on the down grade to the seventy-fifth year, and, in the general *sans* state, we can imagine that questions answered with alacrity at twenty-five will become somewhat severe. For example: "What is the greatest distance in feet and inches at which a watch can be heard?" or "Is there any noticeable dulness or acuteness of smell, taste, and touch?"

The 'Record' is the author's own undertaking, and is the basis of the most searching heredity inquiry hitherto attempted. The scope of the work is four generations, which are reckoned as follows: "On the side of the contributor there are his two parents, four grandparents, an average of three uncles and aunts on each of the two sides, three brothers or sisters, and himself: this makes sixteen persons. There is another set of sixteen for the relatives of his wife in the same degrees. Lastly, I allow an average of four children." A single family history, therefore, involves the extensive collection of thirty-six or more life histories. To each of these a page is assigned, including sixteen questions; the latter indicating that biology is taken in its widest sense to embrace, first, conditions of life, second, personal description, mental as well as physical, third, medical life history. Under the first set are birth, occupation, town and country residence, size of family, mode of life; the middle set includes anthropometric measurements, also mental powers and energy, peculiarities of character and temperament, artistic and allied aptitudes; the third set covers rather minute medical details, and at this point many will probably echo the sentiments of the *Spectator* critic, that one would rather forget the ills that flesh is heir to. The author appreciates the labor of filling one of these records, and offers to his countrymen a large amount in prizes for the fullest and most authentic. He has already, in his 'Inquiries into Human Faculty,' proposed the science Eugenics for race improvement, and he is, perhaps, more sanguine of unearthing some of its now mysterious laws than many of his readers will be. In fact, it will require somewhat of the spirit of research to enter one's family closet with the unsparing truthfulness this 'Record' demands, even when we are assured that the anonymous will be strictly preserved. Yet we venture to assert that the present scientific enthusiasm in England insures the quantitative success of the undertaking at the outset. It has already exceeded Mr. Galton's anticipations. A prediction of the results in quality is quite another matter; that they will tell us a great deal we know already there can be no doubt, and, judging by the perfection and thoroughness of the method, we may look for much more. However honest the effort, it will be a difficult matter to fill one of these records without unconsciously noting down resemblances, to the gradual exclusion of differences, in family character, and considerable allowance for this unavoidable tendency should be made in the averages. One of the least results a layman may hope for is that the author's candid treatment of his returns will somewhat revive our confidence in our own individuality, which has been much shaken of late by "heredity" extremists.

The Field of Disease: A Book of Preventive Medicine. By Benjamin Ward Richardson. Philadelphia: Henry C. Lea's Sons.

CERTAIN cynics maintain that the vast medical charities of civilization are chiefly hot-beds for the culture of retrogressive physical types. In a utilitarian view it is no advantage to prolong, at home or in hospitals, the lives of weaklings who will leave a progeny to be nursed and in turn to spread disease and disability. But the absolute prevention or avoidance of physical evil is another matter than its perpetuation in a mitigated form. The care of the sick is one problem. It may be better for the race to let the tainted and the intrinsically feeble go, to abandon them to the rude forces in spite of which the fittest survive. It is another question to keep the sound well, to shield the vigorous from external danger and disease. The avoidance and especially the prevention of such evils are essentially modern ideas. Our forefathers accepted distempers as they did the weather. A superior power, whose authority could not be interfered with nor its intentions divined, but who might be persuaded or placated, allotted both. One might flee from the plague as he would from an English winter, but he could prevent neither. Protection was invoked equally from lightning, from pestilence, and from famine—evils essentially superhuman in their control. Many still act as though private indisposition and the epidemics of a country-side are mysterious visitations, not logical consequences of antecedent conditions. But the comfortable doctrine of the prevention of disease is spreading, and much of the attention formerly given to its treatment is diverted to the discovery and destruction or avoidance of its cause, and to the popular propagation of this knowledge.

A well-written book on preventive medicine for the average reader ought to meet with instant success, and this large volume on the Field of Disease at first appears to be a competent topographical survey and guide through that nether region. It is good, but it is not good enough. There is little rhetorical condensation, and there are no golden omissions, while over such a range a great deal might be judiciously left out. What omissions there are are chiefly odd in view of much that has been retained. Five hundred of the large pages supply the lay reader with a trifle of the dangerous "little knowledge," much of it entertaining but not very intelligible without some instruction. But old women of either sex will find that their disposition to meddle with the perverted forces of life is not encouraged. Dr. Richardson, who is an eminent and enthusiastic English physician, begins his book with the distinct and wise announcement (p. 21) that he has "nothing to say in it that has any relation to the cure of disease." But unfortunately the Royal College of Physicians has enumerated 1,146 variations from health as the catalogue of disease, and this is a commentary upon the nature of each. So space is given to atelectasis and myocarditis, typhlitis and hypinosis, skoliosis and pompholyx, and half a thousand other formidable or trivial or rare affections, whose names may haunt the student, but which make a very small showing in vital statistics. It is astonishing how many pitfalls there are in the way through life and into how few men fall. Two-thirds of the book will supply practically nothing to medical men and will bewilder most others. But the average reader will relish and may absorb a part of the final two hundred pages, while the very last sixty are strictly those treating of preventive medicine and are very valuable.

It was to be anticipated that so large and all-embracing a work would have errors and omissions, but the nature of some of these is, to say the least, curious. For instance, mania a potu is given as a synonym of dipsomania (p. 349), and white swelling as the popular equivalent of phlegmasia dolens (p. 144). The spleen "lying beneath the liver on the left side" (p. 228), and the liver placed "in the upper part of the abdomen immediately below the midriff" (p. 206), are examples of a vagueness that misleads. That tetanus but not trismus neonotarum should be noted, bunions but not corns, the censure of wet soil but not of rubbish heaps as building sites, the general effects of passion, but not, for instance, its special influence upon the milk secretion—are illustrations of minor incompleteness. The phraseology or the proof-reading is sometimes at fault, as in the repeated use of "industrials" for workers; in "preventative" (p. 558); and, unworthy of a Philadelphia medical press, in "Addenill" for Addinell Hewson, and "McDonnell" for McDowell, the original ovariotomist.

Dr. Richardson makes a strong indictment against alcohol, charging it with 1,000 deaths a week in the United Kingdom alone, and he gives a decided support to the Contagious Diseases Acts. On the whole, it is very well that this book, the first comprehensive one of its class, has been written; but in its present form it is not worthy of the author's just reputation. A patient revision should elevate it to the place that its theoretical importance demands.

An Outline History of Painting, for Young People and Students. With numerous and complete indexes, and numerous full-page illustrations. By Clara Erskine Clement. White, Stokes & Allen.

THE authoress of this, which may be called a minor history, has not remembered that a book for beginners ought to be more exact and simple in its statements than one for mature students. An error incorporated in the foundation is less easily corrected than one in the cornice. The opening paragraphs contain the following: "In speaking of art, we often contrast the useful or mechanical arts with the fine arts; by these terms we denote the difference between the arts *which are used* in making such things as are necessary and useful in civilized life, and the arts by which ornamental and beautiful things are made. The fine arts are architecture, sculpture, etc." Now, the art of stone-cutting and laying "is used in" architecture, which, according to the authoress, is a useless art, and house-building, which is a necessary one; bronze working is as necessary for the plain brass tongs as for the æsthetic pair, wood-cutting as much at home in carving as in furniture; the art of hammering metal, which is one of the bases of civilization, is to be used in making the New York harbor Colossus. There is, in fact, no point at which we can draw the line implied in such a distinctive definition, and it is therefore false.

The authoress need not have considered it necessary to vamp all the old fables of the painters' lives, as that Titian was, as a child, so hard up for pigments that he squeezed the juices of plants to get his colors—evident nonsense. And the stories of the rivalries of Zeuxis and Parrhasius, which, if they had been true, would only have proved that the painters were both very poor ones, might well have been eliminated from a history for beginners. Of Teniers she says: "He had a light, brilliant touch; his color was exquisite, and his arrangement of his subjects was very picturesque"—which, so far as it appeals to beginners and young people, is thrown away, and if technical is nonsensical. The use of studio slang for young people who know nothing of the shop is inadmissible. Of Richard Wilson we read that "he was important, not so much for what he painted as for the fact that he was one of the earliest landscape painters among English artists," which is far from the case in either point. Of Turner we have the information, among much other inaccuracy and absurdity, that he "refused five thousand pounds" for the "Dido building Carthage" and the "Decline of the Carthaginian Empire," while the fact is that he was offered that sum for the former picture alone. Mrs. Clement did not apparently know that the late James Lennox vainly offered Turner £5,000 and then a blank cheque for the "Old Téméraire."

There is little excuse for making books which simply rehearse without method or discrimination the gossip of the antechamber of art,

and this is the main resource of the 'Outline History.'

Early Church History to the Death of Constantine. Compiled by the late Edward Backhouse. Edited and enlarged by Charles Tylor. London: Hamilton, Adams & Co.; Philadelphia: J. B. Lippincott & Co.

THIS volume is in some sense a literary curiosity. Its author was a member of the Society of Friends, and a minister in the meeting, affluent, cultured, something of an artist, a diligent student of natural history, who devoted his energy through the leisure of a long life to practical charity and the elevation of the masses in Sunderland, the place of his residence. He was doubtless a most useful man and a sterling friend, and his photograph, which accompanies the volume, suggests a character of mingled energy and kindness. Unfortunately, in his sixty-seventh year, while one day occupied in painting, it was suddenly borne in upon him, after the fashion of Friends, from the Lord, that, to use his own words, "I ought to devote my leisure in my latter days to writing a portion of Church History, especially with a view of exhibiting to the Christian world, in a popular manner, the principles and practices of the Society of Friends." Under this inspiration, though utterly unequipped for the stupendous task, without even a knowledge of the classical tongues, he vigorously commenced the study of ecclesiastical history, leaving at his death, five years after his call, a considerable mass of manuscript on the primitive church. This the pardonable zeal of friends intrusted to an editor, who put it into shape, remoulded it, filled up gaps, and is responsible, as the preface informs us, for about one-half of the material of the work. It is printed in very attractive form, with numerous illustrations—chromos, etchings, and photographs—some of them from the original sketches of the author, and forms an exceedingly handsome volume.

A book thus produced is of course not a legitimate subject of serious criticism. As the title-page modestly asserts, it is merely a compilation from more or less authentic sources, with long extracts from modern writers, such as Canon Farrar, Cooper's 'Free Church,' Milman, Neander, and other authors to whom Mr. Backhouse's attention chanced to be called. Critical investigation of disputed questions is not to be looked for, and the only interest attaching to the work lies in its purpose to vindicate heretics and toleration against so-called orthodoxy and persecution. Had this been done with a special faculty of historical insight, the book might possess value in spite of the limitations under which the author worked; but this is not the case, and the reader is forced to share the regret expressed in the preface that Mr. Backhouse should have commenced his vindication of Quakerism with the primitive church. "He knew," we are told, "the local history of the North of England well, the history of the Society of Friends perfectly; and if he had confined his labors to these subjects he would probably have produced a work which would have been accepted as an authority in that more limited field." As it stands, the book doubtless supplied to the author's declining years occupation and purpose which were sufficient reward to him.

Tables of European History. Literature and Art from A. D. 200 to 1882; and of American History, Literature, and Art. By John Nichol, M.A., Oxon., LL.D., Professor of English Language and Literature, University of Glasgow. Glasgow: James Maclehose & Sons; New York: Macmillan & Co. 1884.

PROFESSOR NICHOL'S tables will be found very convenient and useful. They consist of five columns on the two opposite pages—foreign history, English history, English literature, foreign literature, and the arts. In the first two columns the several nations are distinguished by different colors, in lines or bars: we should suppose it might have been well to do the same with the other columns. The American tables contain two columns to a page—history, and literature and art. The several tables are not arranged to contain equal spaces of time, but cover more or less time, according as there is more or less material. Thus, the first table contains four centuries; Table V. contains from 1350 to 1425; Table XVI. only twenty-seven years, 1855 to 1882. We should think it would have been well, as the book is at any rate thin, to prefix tables of ancient history.

The special value of the tables will be found, we fancy, in the conspectus presented of the history of literature and art in their relation to general history. The tables of events are not full enough for minute reference, but give just the guide that is needed for the purpose of literary references. Of course the names and events to be selected are a matter of individual judgment, in which there is great room for difference of opinion. Turning to the period 1110 to 1150, for example, we should say that the foundation of the kingdom of Portugal, 1139, was much better worth mentioning than "Leopold of Austria in Bavaria," 1138. The order of the names is sometimes hard to understand; for example, in the first table, Constantine, Alaric, and Mahomet are given in the centuries in which they were born, not those in which they flourished; President Lincoln is put just before the date 1860, and Professor Goodwin stands before his old instructor, Professor (rather President) Felton. We notice that G. Ripley is represented as still living. Occasionally an event is given without a date, as League of Cambray, and resignation of Victor Amadeus (called of Savoy, when it should be of Sardinia).

BOOKS OF THE WEEK.

Addis, W. E., and Arnold, T. A Catholic Dictionary: Containing some Account of the Doctrine, Discipline, Rites, Ceremonies, Councils, and Religious Orders of the Catholic Church. Catholic Publication Society.
Anderson, E. L. Modern Horsemanship. A New Method of Teaching Riding and Training. Edinburgh: David Douglas.
Bestmann, H. J. Die Anfänge des Katholischen Christentums und des Islams. Nördlingen: C. H. Beck'schen Buchhandlung.

Teaching of the Twelve Apostles. Edited, with a Translation, Introduction, and Notes, by Profs. Roswell D. Hitchcock and Francis Brown. Charles Scribner's Sons.

"*A Remarkable Novel.*"

It is admirably written; the scenes are powerful and thrilling; its plot shows a wonderful imagination, not running wild, but trained to sustained work; it is intensely interesting, and no one can say that the peculiar mental or spiritual experiences related are impossible."—Boston Advertiser.

5th Avenue Hotel, Place 3, Corner 5th Ave. and 23d St., New York City. Catalogues of Books on Social Sciences, History, Philosophy, etc., ready. 1st editions of Hawthorne, Poe, Longfellow, Emerson, etc., bought and sold. Correspondence solicited.

JUST PUBLISHED. 4TO. £1. 1s. 0d.

Gray's Elegy.

From the MS. bequeathed by the Poet to his Biographer, Mason, in the possession of Sir W. A. Frazer, Baronet, M.A., F.S.A., and edited by him.

One hundred copies only; printed on the best Dutch hand-made paper.

London: Francis Harvey, 4 St. James Street, S. W. Orders received by Tice & Lynch, 34½ Pine St., New York.

FAUST.—*For sale, a unique collection of* engravings on steel, copper, and wood, many of them early impressions, and many very rare, with original drawings and photographs large and small, containing in all nearly 600 illustrations of the great German masterpieces, including more than a score of portraits of Goethe. Apply to FAUST, at this office.

The Nation.

NEW YORK, THURSDAY, APRIL 17, 1884.

The Week.

THE Democratic Convention which met on Wednesday in Pennsylvania and nominated Mr. Randall for the Presidency, was, if we may judge from the platform, the purest assembly that was ever called together in any country. How many such bodies, for instance, would declare themselves boldly, as this one has done, against "centralization, monopoly, extravagant expenditures, subsidies, and a debasement of the civil service to partisan spoliation"? Then it is most encouraging to find it coming out for that old tariff which has been the dream of saints and sages in all ages—though, owing to the imperfections of our corrupt nature, it has never yet been embodied in legislation—the "tariff for revenue limited to the necessities of the Government economically administered, and so adjusted in its application as to prevent unequal burdens, encourage productive industries at home, and afford just compensation to labor, but not to create or foster monopolies." Other parties or conventions, too, often express their scorn and contempt for the poor man who is trying to rise in the world and save a little money for his old age; but the Pennsylvania Democrats—God bless them!—declare in the frankest and manliest way that "every legitimate effort of labor to better its condition, enhance its rewards, and protect its rights, commands their sympathy and support."

On State affairs the sentiments of the Convention were equally pure, wholesome, and elevating. Many a Convention would, in these times of anarchy, recommend the overturning of the State Constitution, the complete release of corporations from all Governmental control, the use of the taxes for individual debauchery and aggrandizement, and a total disregard of the laws of the land in the management of the treasury. The Pennsylvania Democrats, however, are men of a very different mould, for they "favor the enforcement of the Constitution of Pennsylvania in its every article and section, and especially demand the regulation by law in accordance therewith of the corporations of the State, the equalization of the tax laws, the appropriation of public moneys to public uses only, an honest management of the State treasury, and rigid enforcement of the laws governing it." Most Conventions, too, would experience some difficulty in finding a candidate fit to stand on such a platform, for it needs a man of really heroic mould, "one of Plutarch's men"—in short, a simple, pure, far-seeing, and absolutely single-minded patriot. In almost any other State or country a party would have to advertise for such a man, and probably to wait for some time before he turned up. The Pennsylvania Democrats, however, had him all ready in the person of Samuel J. Randall before they put pen to paper.

A stir was caused last Thursday among the Democrats by the appearance of the *Great Republic*, the new semi-weekly national Republican newspaper. The subscription is fixed at the price of $5 a year or $3 for six months; but, curiously enough, no provision is made, as in the case of most newspapers, for the purchase of single copies; at least no price per copy is given, so that the matter has to be remitted to what Adam Smith would call the "higgling of the market." It may be, however, that the proprietors contemplate only sales by subscription, and they have, of course, a perfect right to adopt this plan. The same thing may be said of the fact that the first number appears with the four inside pages blank, for which we are surprised to notice an editorial apology. Every newspaper has a right to come out with blank pages, and it must often be far less expensive to do so. This is the chief peculiarity in our new contemporary, which we gladly welcome to the ranks of journalism, and whose career we shall watch with interest, however short it may be.

There is no more melancholy feature in the Blaine boom than the absence from it of Colonel Robert G. Ingersoll, the gallant old infidel, who really started it in 1876 by the "plumed knight" speech. He was remorselessly thrown aside in 1880, however, by Mr. Blaine's managers on account of his scepticism, they being above all things a religious body of men, and anxious that their candidate should retain his hold on the religious sentiment of the country. Now Colonel Ingersoll cannot get to the Convention at all, either as a Blaine or anti-Blaine man. He has just been defeated in Washington, and is beginning to find out that the divorce between religion and politics, even in the United States, is not as complete as some people suppose. But even the infidels have been pained of late by the Colonel's defence of all kinds of rascals. There ought to be some morality, they say, even in his irreligion.

Secretary Frelinghuysen's plan for an International American Conference, or rather for a Commission to ascertain whether there is any good basis and *raison d'être* for such a conference, betrays such feebleness of purpose, and such a lack of definite aim, that Congress may well conclude to postpone its consideration until more pressing reasons can be shown for taking it up. The Secretary takes care, in the first place, to set forth the reasons why there should be no such conference. Such an alliance, or quasi-alliance, might commit us to a protectorate over the Central and South American republics. It might lead to a meddlesome foreign policy, and bring about needless controversies respecting matters in which we have no real interest. The sister republics might look to us for protection against each other as well as against European Powers. Calls might be made upon us for the expenditure of money for the development of these countries which could not be responded to. The failure of the Panama Congress, in John Quincy Adams's Administration, is cited as a warning against hasty and ill-considered essays in this field of diplomacy. In short, Mr. Frelinghuysen very nearly demolishes his own project before telling us what it really is.

Mr. Murat Halstead, of the Cincinnati *Commercial Gazette*, was one of the chief promoters of the silver legislation from which we are now suffering. He was at one time so devoted to the silver gospel that he inserted as many as sixteen silver articles in his paper in a single day, all of great vehemence. His thesis was that the act demonetizing silver was the result of a conspiracy concocted by bankers and capitalists, known as "gold bugs," or "money kings," who liked a gold standard because, gold being dear, they would be able to keep all the money to themselves and leave none for the poor man; that silver, too, was "the dollar of our fathers," which the children ought to retain on sentimental grounds; that, anyhow, before the demonetization of silver, every American had the option of paying his debts in gold or silver; and although, as a matter of fact, he did not use this option, but always paid them in gold, still it would be wrong to deprive him of it. It was freqently pointed out to Mr. Halstead, in the course of the discussion, that the condition of things abroad had an important bearing on our mode of regulating our currency; that the tide of opinion in Europe was running against the double standard, and toward the disuse of silver for anything but small change, and that if we undertook to coin silver in large amounts and make it a legal tender, it would strengthen this anti-silver current in Europe by providing a place where the foes of silver could dump as much of it as they wished to get rid of. His answer to this was substantially the famous phrase which Mr. Stanley Matthews used in the Senate: "What have we to do with abroad?" He held that it was not true that the European governments were disposed to discard silver; that on the contrary the tendency of opinion in Europe was toward the double standard; that the remonetization of silver in America would raise the price of the metal to the old figure and restore its steadiness, and that in any case it would make no difference to us what Europeans did about their currency. It is needless to say now that every one of these assertions has been falsified by events.

Mr. Halstead now admits, in a letter to the delegate of the Cincinnati Chamber of Commerce, at present in Washington, that he did not sufficiently "take into consideration two great matters—first, the international aspect of the question of the maintenance of one or two money-metal standards, and second, the persevering and perverse hostility to silver as money-metal of nearly all the great financial authorities and money centres of this country and England." In the use of the word "perverse" to characterize this hostility we see some of the sparks of Mr. Halstead's old

passion. It cannot be perverse to disagree with Mr. Halstead, on a matter on which he now acknowledges that he has made tremendous mistakes. The great financial authorities and money centres of this country and England have clearly given far more consideration to the currency question than the Western silver editors. Moreover, there is nothing more absurd than to suppose that the money centres of the world are not interested above all things in having a stable currency. The notion that they like a standard that fluctuates ought not to find a lodgment in the brain of anybody who knows anything about the operations of trade. The reason is really very simple. At the money centres of the world, nearly all the great transactions are based on credit in some form—that is, on promises to settle at some future date. Nothing, therefore, is more necessary to the conduct of business than fixity in the value of the money in which the settlement is to be made. Every financier needs, above all things, to be sure that he will receive on the first of April full value for what he gave on the first of January. Therefore, when he is advocating any particular standard of value, it is all but certain, if he is in good health, that it is what he considers the most stable standard. It is from the belief that silver is unstable in value that it is now suffering at the money centres. The notion that financiers do not like it from "perversity" or prejudice is worthy only of an open-air meeting of Communists.

The course of trade furnishes some grounds for the belief that business is again rising, not rapidly but surely on a secure foundation. The readjustment of prices and of avocations necessary to renewed commercial activity has been going on for two years. It could not be considered complete and effectual until the prices of the principal articles of food experienced a decline corresponding to that which has taken place in other commodities. The equilibrium having been measurably restored, we may reasonably expect a more cheerful aspect of industrial and mercantile life. The past week has shown a slight improvement in most branches of trade. Railway earnings, both gross and net, are up to the mark of last year, except where heavy rate-cutting has been practised. The movement of produce toward the seaboard continues large, but there has been no material increase of exports. A reaction in wheat, which advanced about 3 cents cash from the lowest depression, led to considerable activity in domestic trade and to some movements looking to a revival of exportation. Gold to the amount of nearly $4,000,000 was sent abroad, making upwards of $19,000,000 exported since February 21, but the plethora of money remains unaffected, and the rate for call loans is still in the neighborhood of 2 per cent. Cotton goods have become somewhat more active in consequence of a further advance of ¼ cent in raw cotton. Other branches of the dry-goods trade remain about as before. The iron and coal trades continue extremely dull.

The course of the stock market has been again downward, the most marked declines being in Oregon Navigation, Wabash, West Shore bonds and Western Union Telegraph. The remainder of the list was fairly steady. Some strength was imparted to the trunk-line stocks by the report that a new plan was under consideration for pooling cash receipts instead of pooling tonnage, and also for abolishing all agencies for soliciting business and all fast-freight lines. The latter part of the proposed plan is by way of reducing expenses, and is rendered necessary by the reduction of receipts. But experience has proved that agencies cannot be safely discontinued by one road unless they are discontinued by all, and that there can be no satisfactory guarantee upon this point if any motive exists for the employment of agents. The pooling of earnings, it is believed, would take away every incentive to violate or evade the common agreement, so that expenses might be reduced and rates maintained, so far at least as they are within the control of railways. But there are very grave difficulties in the way of such a consolidation of interests. How, for example, can the earnings of the New York Central be lawfully diverted to the treasury of the Grand Trunk to be distributed as dividends to the stockholders of the latter company in London, or vice versa? Would not the courts put a stop to such arrangements on the complaint of any shareholder, and would there not be shareholders in plenty to make such complaints?

The Board of State Railroad Commissioners have submitted an elaborate report on the Senate bill "to secure *pro rata* charges for local freight carried by railroads in the State of New York." This bill, which sought to prohibit railroad companies from charging more, in proportion to distance, for local freight than for through-freight, was referred to the Commissioners one year ago, and has been the subject of a very painstaking investigation. As a preliminary step the Commissioners sent circulars making specific inquiries for information to all the agricultural societies and State Granges, to Mayors of cities, Chambers of Commerce, and Boards of Trade, manufacturers, merchants, millers, farmers, editors, etc., as well as to the railroad companies and fast-freight lines. The conclusions reached by the Commissioners are adverse to the bill, which they say would cause greater evils than it would cure. They affirm as a general principle that railroads should not charge more for local than for through-freight, but that circumstances may exist which justify such a practice in particular cases, and that railroads should be allowed to plead the facts in each case where unjust discrimination is alleged. They point out, however, an abuse against which they recommend specific legislation. They ascertained that the railroads along the line of the canals make lower rates to shippers who agree to give the railroads all their freight, than to those who employ the canals during the season of navigation. They acknowledge that the railroads have some ground for justification in the premises, since the State has abolished tolls and has assumed the task of keeping the canals in repair out of the proceeds of general taxation. Nevertheless, they recommend that the practice of discriminating against those who use the canals be prohibited.

The Raritan and Somerset Woollen Mills, at Raritan, Somerset Co., N. J., have just been closed, throwing 1,200 persons out of work. The operatives had struck. The story they tell is a remarkable one, if true. They say their wages have been declining for the past three years. The Superintendent said he would rather have the mills idle for three months than increase wages in the present condition of business, and the Newark *Daily Advertiser* says "the whole town is practically out of employment, and in many cases there will be great suffering if the strike continues long." This is a most unfortunate state of things to exist on the eve of a Presidential canvass in which the tariff is expected to be a leading issue, and in which the workingmen are expected to support by their votes the theory that the tariff as it is is their one defence against privation and the pauper labor of Europe. The Raritan people must feel that there must be something very doctrinaire about this view, or they would themselves be better off. In fact, there probably never was a harder task set before theorists than the task of making the protectionist account of the uses of a high tariff tally with the actual condition of American industry.

The adoption by the House, without discussion, of the report of the Committee which found that Mr. Keifer's charges against Mr. Boynton were simply calumnious falsehoods, is really, considering that Mr. Keifer was Speaker of the House in the last Congress, a most painful and discreditable affair. But it has been made more painful and discreditable by the fact that, although Keifer had, during his Speakership, supplied abundant proof that it was an immense mistake for the Republican party to have put him in any prominent position, the Republicans in the House deliberately aggravated it by giving him the complimentary nomination for the Speakership in this Congress. He ought to have been promptly unloaded at the first convenient stopping place, and no further notice ever taken of him. He was not many weeks in the Speakership before it became apparent that he was the tool of the most corrupt jobbers in the party, and his dealings with the stenographers showed that he was as deficient in shame as in integrity. His constituents ought now to remove him wholly from political life, and they will probably do so.

The cultured society of Chicago is passing through another very painful crisis since the discovery that the Matthew Arnold letter was a hoax. The prominent citizens who denounced and exposed Mr. Arnold so freely on the strength of the letter, are now engaged in the very trying process of getting out of the scrape. Professor Swing modifies his remarks so as to make Arnold simply an "egotistical" or "blunt" man, who frightened a servant at his table by the peremptory way in which he said "Salt." Most of the others who committed themselves are silent, except Canon Knowles, who observes enigmatically, "I re-

gard the thing as below par." General McClurg, who was Arnold's host during his stay, is the only one who comes off really creditably, for he refused to comment on the hoax, and is now able to say that he always regarded Mr. Arnold as "a gentleman of culture and refinement." We trust the affair will be a warning to the scholars and critics of Chicago, for it is a very humiliating one. They ought to have been able to detect the fraud at a glance, by the style. Professor Swing, in particular, seems to us to need a little ripening.

Professor Adler has come out in favor of "reform in home life." The trouble with home life, he says, is that "too much drudgery is imposed upon our women," the kitchen being made the "base of our houses," and woman, being occupied with low household duties, is unable to exercise those ennobling influences we demand of her. In the same way, the mother, being busy in the kitchen, has no time to train herself to understand the "soul life" of the child, which explains much of the misunderstanding between them that we so often notice. Professor Adler thinks that some form of coöperative housekeeping is what is needed to liberate the mother from her present slavery; but he does not seem to have noticed that, as far as it goes, the flat or apartment accomplishes the ends he has in view. Flats were invented for the benefit of woman; flat life relieves her of a great deal of drudgery. She does not get rid of the kitchen, but she gets rid of stairs, cellar, and garret, can get along with fewer servants, and is not occupied nearly so much with low household duties. To this extent, therefore, she has an opportunity of exercising those ennobling influences we demand of her, and of giving herself up to the study of the "soul life" of her children. It would seem to follow from this that the women who live in flats must be a great deal better and purer than those who live in houses—allowance, perhaps, being made for any difference in rent.

The trustees of the Astor Library have determined, it is said, that they cannot open it in the evening, owing to lack of funds, and their decision has called out some criticism which is evidently founded on the mistaken theory that the Astor Library is a public institution. It is a private foundation, with a public object, but that object does not seem to be to establish a public library like those existing in other great cities with which it is often compared. We see no reason to believe that the library will ever resemble anything of the kind, or that any amount of criticism will lead those interested in the matter to try to create such a library. Under these circumstances, contrasts of the management with that of the Boston Public Library or the British Museum seem only calculated to distract attention from the main point—the crying need of a real public library.

The "war" in Cuba, set on foot by Aguero, is evidently a freebooting raid, which is not in the least likely to cause any trouble between the United States and Spain. It has, as usual in all such cases, produced the suggestion that we should buy Cuba, but the drift of public opinion has ever since the war been against such a purchase. Cuba, governed with difficulty now by the aid of "troops," would make a most extraordinary American State and the Cubans very queer American citizens. What wonderful primaries, and conventions, and "halls" it would develop, and what striking figures the Cuban delegates to the Presidential Convention would be!

The capture of some more dynamiters in England is a good sign as to the skill and vigilance of the English police, but thus far nothing has been discovered to connect the prisoners with confederates on this side of the water. This does not, however, hinder the London press from assuming that they are emissaries of an Irish-American organization, and resuming the denunciations of the American Government which broke out after the explosion at the Paddington Station, of the origin of which nothing is known to this day. The *Observer* maintains "that if the American law cannot reach the dynamiters it ought to be altered," which is quite true, but not to the purpose. The American law can reach the dynamiters, if they can be found. It is the difficulty of finding them which makes them so formidable. Even in England, where they do their work and get their machines ready for action, and where they cannot enter without passing the custom-houses, this difficulty is found to be very serious indeed. They have succeeded in producing at least two formidable explosions in London, and made all the preparations for another in a very public place, without detection. If the dynamiters do any part of their work at all in this country, it is merely the formation of the plan, and although it is of course possible to get evidence of a conspiracy of this kind, it is, as the English police know well, no easy matter. What really makes the dynamiters so dangerous is the very fact that their schemes need so little preparation. The laws now on the statute-book intended for the fulfilment of our obligations to foreign states were aimed against armed expeditions and other enterprises requiring the coöperation of considerable numbers of men. In bygone days, it would have taken a great many conspirators and weapons and much ammunition to blow up a public building in a great city, or kill a sovereign in his own dining-room, surrounded by half a regiment of his guards, as the Russian Nihilists came near doing. Now two men with a little box can do it.

The dynamiters last arrested in England appear to have had their headquarters in Paris rather than here, although the French police have means of laying hands on such persons which the American Government could never obtain. There is every disposition on the part of the public here to do whatever can be done towards catching dynamiters here before they start, or towards getting information about them for the English police, but it is a disposition which would be readily changed into irritation by unreasonable demands or wild objurgation on the part of the English press. Trial by jury, for instance, cannot be suspended here, as it might be on a pinch in England, and juries require evidence in order to convict, and evidence cannot be manufactured. It has to be procured, and whether you can procure it or not, especially in cases of conspiracy, does not depend altogether on your zeal. The nature of the case has much to do with it. The English press must not be led astray by the foolish talk of Mr. Goldwin Smith's Toronto paper, the *Week*, which rejoiced lately over the Attorney-General's circular enjoining the enforcement of the law against the exportation of explosives, and said this showed what could be done, etc., etc. The circular was really of no importance whatever.

It is reported that positive orders have been sent to General Gordon to evacuate Khartum as soon as he can. His troops, unreliable at best, have begun to mutiny, and the enemy keeps up his attacks, which, though not formidable, are wearing. Moreover, at this season the aid of a European force is out of the question. Colonel de Coetlogon, who left the place a month ago, however, reported that General Gordon had then made up his mind to evacuate, but was probably trying to hold out till May, when the rise of the river would enable him to reach Sennaar to withdraw the garrison there. The difficulties between Mr. Clifford Lloyd and Nubar Pasha at Cairo are still unsettled, and are probably incapable of settlement. They arise out of the state of things no less than out of the temper of the men. In the meantime, however, attention in England may be withdrawn from Egypt at any moment by a dissolution of Parliament, which the best friends of the Ministry acknowledge to be imminent, and which any check in the progress of the Franchise Bill would precipitate.

There seems to be some reason to dread that the publication of the Bulwer memoirs may yet lead to another family exposure like that of the Carlyle household. The *Academy* contained a little while ago a communication throwing out a hint that, notwithstanding the mean way in which Lord Lytton had salved over the peculiarities of his father's character, the truth might yet be told, and, as a suggestion of what the truth would be, gave the following rather neat bit of analysis of the novelist's character:

"His one paramount object was to be marked, be it in literature or politics, in dandyism or gallantry, posing as the victim of some abiding sorrow, or exchanging slang with thieves and highwaymen. His extreme sensitiveness displayed itself in resentment to criticism or any difference of opinion, and herein can be seen the origin of those domestic scandals that are probably remembered by only a few of your readers. His wife, who for so long a period had been foremost among his hero-worshippers, began to waver, was suspected of doubting, and finally declared apostate from the true faith. When want of respect on one side was met with yet larger claims to devotion on the other, all chances of happiness were at an end. The punishment of the pervert was an *auto-da-fé* to assuage the anger of the offended deity and to prevent the spreading of a dangerous heresy."

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, April 9, to TUESDAY, April 15, 1884, inclusive.]

DOMESTIC.

THE Senate Committee on Foreign Relations on Thursday reported adversely three bills relating to the establishment of peaceful and reciprocal commercial relations between the countries of Central and South America and the United States. In place of these bills the Committee report an amendment to the Consular and Diplomatic Bill, which provides $100,000 to enable the President to compensate a Commission to examine the relations of the United States with these countries, and report upon the best modes of securing intimate national and commercial relations between them and the United States; and also to enable him to compensate delegates of the United States to a congress of these States, to be held in Washington, should it be deemed advisable to convene such a congress. Secretary Frelinghuysen has sent the Committee a letter questioning the expediency of a congress, and saying: "The true plan, it seems to me, is to make a series of reciprocity treaties with the States of Central and South America." He also suggests "the adoption of a common silver coin which should be current in all the countries of this continent."

The Senate on Monday passed the Naval Appropriation Bill with the amendment providing for the building of new steel cruisers. Two million dollars is added to continue work on the double-turreted monitors. The discussion of the Bankruptcy Bill was then begun.

The House on Friday passed the Senate Bill offering a reward of $25,000 to any vessel rescuing or ascertaining the fate of Lieutenant Greely and his party. The report of the Keifer-Boynton Investigating Committee exonerating General Boynton was adopted without any debate, much to the chagrin of the ex-Speaker. There were only two viva-voce votes in opposition.

In the House on Tuesday Mr. Morrison (Dem., Ill.) moved to go into Committee of the Whole for the consideration of the Tariff Bill. There was no division, and the motion was agreed to. Immediately upon the Committee's assembling, Mr. Eaton (Dem., Conn.) objected to the consideration of the bill, and the objection was reported to the House. A vote was then taken upon the question whether the bill should be considered, and by a vote of 140 yeas and 138 nays the Committee decided to consider the measure. The announcement of the vote was greeted with loud applause by the Democrats. Six Republicans voted for the consideration and 49 Democrats against it. The vote was so close as to make the conclusion seem probable that the opponents of the bill may be able to strike out the enacting clause. Some votes were cast for consideration which will probably be given against the bill.

Adam Badeau, Consul-General at Havana, the friend and biographer of General Grant, resigned on Friday. There are reports affecting the accuracy of his accounts. There are also reports that his resignation was due to the Aguero difficulty, but they have not been confirmed.

President Arthur, on Tuesday, nominated Charles E. Coon, of New York, as Assistant Secretary of the Treasury, in place of John C. New, resigned. Mr. Coon is at present Assistant Chief of the Loan Division of the Treasury.

The Pennsylvania Democratic State Convention met at Allentown on Wednesday. Resolutions were adopted containing the Ohio tariff plank, and declaring for Samuel J. Randall as the choice of the Convention for President. General W. H. Davies was nominated for Congressman-at-large (the only official to be elected by the State this fall). Delegates-at large to the Democratic National Convention and an electoral ticket were chosen. The Convention was completely in the control of the Randall faction.

The Republicans of Missouri, in Convention on Wednesday evening at Sedalia, passed resolutions renewing their allegiance to the national platform of 1880, approving of President Arthur's Administration, and pledging their support to the national nominees of the party.

The Georgia Republican Convention has elected delegates to Chicago who will first vote for Arthur.

The results of the recent Republican primaries and district conventions in the northern part of this State show an anti-Arthur sentiment. County conventions held on Wednesday in various parts of the State resulted in an increased anti-Arthur vote.

In the Assembly at Albany on Wednesday, the bill to abolish the State paper was passed, 80 to 13. A bill providing that the manufacture of cigars or tobacco in any form on any floor, in any tenement-house occupied as a home or residence for the purposes of living, sleeping, cooking, or doing any household work, in cities of over 500,000 inhabitants, shall be unlawful, was also passed, 104 to 5, on Thursday. A Constitutional Amendment was passed to secure home rule for cities.

The audacity of the lobby at Albany reached its culminating point on Thursday, in anticipating the report of the Assembly Railroad Committee on the General Street Railroad Bill. They invaded the Assembly Chamber. The horse car lobby and that of the cable system were specially bold in their operations. Members were dragged out singly and in little squads to be badgered and coaxed and bought in the presence of the whole Assembly and under the eyes of the Speaker. Their audacity finally became so unendurable that the Chair directed the Sergeant-at-Arms to clear the floor. This order was given twice before the lobbyists were finally driven from the Chamber.

A number of the Roosevelt city reform bills were passed by the Assembly on Tuesday. Only one of the nine now remains to be passed.

A bill for the preservation of the Adirondack forests was passed by the State Senate on Wednesday.

A mass-meeting was held in Chickering Hall, in this city, on Wednesday evening in favor of the preservation of the Adirondack forests. Carl Schurz, F. B. Thurber, Henry Bergh, and others spoke, and resolutions were adopted appointing a committee to secure legislation for the proper protection of the forests.

Judge Van Brunt, in the Common Pleas, Equity Term, in this city handed down his decision on Tuesday in the suit of the Metropolitan Elevated Railroad Company against the Manhattan Company to set aside the agreement of October, 1881. The decision directs that the agreement shall be set aside upon the Metropolitan Company doing what it can to restore the status quo existing between the parties prior to October 22, 1881.

The report was received on Monday that the United States and Brazil Mail Steamship Company's steamer *Reliance*, from Rio Janeiro for this city, had been wrecked off Bahia, Brazil. The crew, passengers, and mails were all saved. The cargo was a total loss. It contained among other things 7,000 bags of coffee. The *Reliance* was built in 1883, was valued at $350,000, and was fully insured.

There was a rumor sent from St. Johns, Newfoundland, on Monday, that the Greely party had been rescued from a mass of floating ice by the crew of a whaling schooner. It proved to be a canard.

John C. Perry, the new Chief Justice of Wyoming Territory, died suddenly on Monday in Brooklyn.

The Rev. Dr. John C. Backus, pastor emeritus of the First Presbyterian Church in Baltimore, and one of the most prominen clergymen in his denomination, is dead at the age of seventy-three.

The steamship *Grecian*, from Glasgow, arrived at Boston on Wednesday, bringing 236 immigrants said to have been shipped from the workhouse at Swineford, Ireland. The customs authorities, having been warned to investigate the matter, ascertained that they were "assisted immigrants," and not paupers, and had from $5 to $40, according to the size of each family, given them by the agent of the Tuke fund on the other side. They were fully up to the requirement of the immigration law, and were allowed to land.

FOREIGN.

Sir William Harcourt, British Home Secretary, several months ago warned the police of the arrival of a dynamiter in England. It was soon discovered that a man named John Daly alias Denman, who answered to the description, had taken lodgings in Birmingham with a clerk named James Egan. Last Wednesday he went to Birkenhead and was closely followed by officers. On Friday he was arrested as he was about to return to Birmingham. Three explosive bombs were found in his possession, and several bottles containing a substance believed to be nitro-glycerine. Egan was also arrested at Birmingham. He maintained the utmost coolness and had nothing to say. A lot of documents belonging to him were taken to the police station, one of them a letter from Egan to Daly, in which he referred to the "cough mixture" as being "nice and cold." It is believed he referred to dynamite. It is said that Daly is an American, and that he is acquainted with Patrick Fitzgerald, the Fenian, arrested in London on Thursday. It is stated that Fitzgerald has been in regular communication with P. J. Sheridan. He was connected with James Carey's gang, and once presided at a meeting of Invincibles in Dublin.

Both Egan and Daly were brought before magistrates on Saturday and remanded. Fitzgerald was arraigned at Sligo, Ireland, on the same day and remanded.

Two men who were lounging near Egan's house in Birmingham, England, on Sunday, were arrested, but proved to have no connection with the Fenians. The London *Times* on Monday said of the recent arrests: "The expectation is strong that these arrests will lead to important disclosures which will throw light upon the recent explosions. We believe that one or two informers will be produced who will reveal the headquarters of the conspiracy, whether in France or America."

Colonel Majendie, in his report on the recent dynamite attempts in England, says that the substance used was lignin dynamite, which is manufactured in America but not in England, that the clocks were of American make, and the pistols a common American pattern. In spite of this report it is declared in Paris that the dynamite used at the Victoria Station explosion was manufactured at a place between Amiens and Boulogne.

The London *Times* on Saturday printed a communication from its Paris correspondent, which gave much information concerning the dynamite and Clan na Gael Societies. The Constitution and the terms of the oath of these organizations were fully described. An account was also given of how dynamite is obtained in France. It was asserted that the Clan na Gael Society had received a letter, bearing a Russian postmark, from the informer McDermott, in which he pleads his innocence and begs for mercy. The society treated the letter with silent contempt, and its agents are tracking him. A constant watch is kept upon the informers Lamie and Coleman, and a record of their movements is regularly kept at Paris.

There was a rumor afloat in Paris on Tuesday that an attempt would soon be made to blow up one of the London public buildings. The activity of the dynamiters in France con-

tinues, it is said, unabated. They meet twice every week for the purpose of making plans and preparations for future outrages. It is believed that the English and the French police are fully acquainted with their movements, and that every effort will be made to counteract their plots. There is great reason to believe that one of the most trusted of the dynamite leaders keeps the police fully informed of all their plans.

Mr. Froude, the English historian, is suffering from work and worry over the Carlyle memoirs, and proposes to make a lecturing tour in America and Australia to recuperate.

Charles Reade, the English novelist, died on Friday at the age of seventy. He was the son of a substantial country gentleman, and was graduated from Magdalen College, Oxford, in 1835. He showed an early aptitude for story-writing; and although admitted to the bar, devoted himself entirely to literature at the age of twenty-eight. Before he was thirty he brought out "Gold," a drama. His first very successful novel was 'Peg Woffington,' published in 1852. 'Christie Johnstone' followed with almost equal success. In the next twenty-five years he wrote many novels, all of which met with popular favor. The most famous among them are 'Hard Cash,' 'Griffith Gaunt,' and 'Put Yourself in His Place.' Many of his later works have aimed to expose and correct social and public evils. He was the author of a number of plays. "Masks and Faces" still holds the stage. Personally he was eccentric, irritable, but kind-hearted. He was buried privately on Tuesday at Willesden. Mr. George Augustus Sala, Mr. Edwin Arnold, and a few other literary friends of the dead novelist, were present.

Henry J. Byron, the well-known English dramatist and actor, is dead at the age of fifty. His grandfather was a first cousin of Byron, the poet. He went on the stage when about eighteen, but left it to study medicine at the wish of his parents. Tiring of this, he returned to the stage with small success, and then began to study law. During hours that should have been given to law he wrote plays. One of these, "Fra Diavolo," was accepted by Miss Swanborough and produced with great success in 1858 at the Strand Theatre. A great number of burlesques, farces, etc., followed with rapidity. His most successful play was "Our Boys." Among his other plays are: "Blow for Blow," "The Lancashire Lass," "Dearer Than Life," "The Prompter's Box," and "The American Lady." In several of these plays he acted parts successfully.

Lawrence Barrett appeared in "Yorick's Love" at the Lyceum Theatre, London, on Saturday night, and met with fair success. The London *Times* says that he is a highly trained actor. The *Standard* finds in him no trace of tragic power.

The French General Millot has telegraphed from Tonquin: "On April 9 Hunghoa was bombarded for six hours. The Chinese offered no resistance, but evacuated after setting fire to the town, which is now in flames. Part of the Chinese fled to Phulam and part to Davang and Tanhhoa." The Marquis Tseng has been summoned to Pekin to confer with the Supreme Council, but is not recalled in disgrace. The new French Minister is charged to offer at Pekin conditions of peace which stipulate that China shall accept a limited French protectorate over Tonquin. No indemnity demand is mentioned.

It was reported in Paris on Tuesday that the French fleet had occupied Amoy in order to secure the payment of the indemnity from China. The report proved without foundation. The capture of Hunghoa terminates the campaign in Tonquin. The financial question remains to be settled with China. The latest advices indicate that the Chinese Government is greatly exercised over the French victories. The officers answerable for the loss of Bacninh have been condemned to be beheaded. A general levy of men for the Chinese army has been ordered. Affairs at Pekin are represented to be in an extremely critical condition, and administrative changes of great importance are imminent.

The latest advices from Shanghai report a serious political crisis at Pekin. The Empress has publicly degraded Prince Kung and four members of the Privy Council, because of the dilatory manner in which they have dealt with Tonquin affairs Prince Kung is charged with accepting bribes and aiming at supreme power.

Despatches received on Friday, dated Berber, April 9th, state that the tribes between Berber and Shendy are in a state of insurrection. They have seized a boat laden with provisions which was proceeding to Shendy. The rebels are besieging Shendy, and a portion of the Berber troops have gone to that city's relief.

There was a rumor at Suakim on Sunday that Khartum had fallen and General Gordon had been taken prisoner. It is unconfirmed. Communication with Berber, both by land and water, has been cut. Earl Granville is preparing a circular to the Powers declaring that England is desirous of renewing a definite understanding in regard to Egypt, and of establishing future relations on an international basis.

A despatch has been received from General Gordon, dated March 30, which contains the following information: "On March 25 General Gordon disarmed 250 Bashi-Bazouks who had mutinied. The following day he shelled the rebel camp on the Blue Nile, killing forty of the enemy. On March 27 the rebels fired upon Khartum from the village opposite. But this they were soon forced to evacuate, losing fifty-nine men in the engagement. The Bashi-Bazouks occupied the village and held it until March 30. On that day the rebels returned in force and drove them out, but then retired themselves." General Gordon estimates that the rebels about Khartum number fully 2,000. He was ordered by the British Government on Wednesday to withdraw from Khartum as soon as possible.

The Sheikh Morghani received a letter on Wednesday from Osman Digna in which the latter said he would, on April 13th, send some sheikhs to meet Morghani at a spot distant from Suakim two hours' ride, and that they would hold a conference with him on the question of an understanding with the Egyptian and British authorities. The conference took place, but resulted in nothing, owing to the rumored fall of Khartum and other rebel successes.

A letter of El Mahdi has been published in London. In this he commands the tribes to push forward the siege of Khartum, to blockade all the roads, and embarrass the Turks and infidels in all other ways possible, as a religious duty.

The differences between Nubar Pasha and Mr. Clifford Lloyd were arranged on Thursday, by limiting the latter's powers. He will hereafter be purely an Egyptian official. Nubar is elated over his triumph. It is thought that the compromise is only temporary.

A statue of Gambetta was unveiled on Monday at Cahors, and eulogies were pronounced by Prime Minister Ferry and General Campenon, Minister of War.

Jean Baptiste Dumas is dead at the age of eighty-four. In 1849, he was made Minister of Agriculture and Commerce, and was Vice-President of the Senate from 1861 to 1863. In 1876 he was elected to Guizot's chair in the French Academy.

Queen Victoria will arrive at Darmstadt on April 17, where she will have an interview (probably on family affairs) with Emperor William on April 21.

There was a rumor on Wednesday that Herr von Eisendecher, the German Minister at Washington, would be recalled on account of his action during the Lasker incident. It proved unfounded.

The recent statement of Signor Mancini, in the Italian Chamber of Deputies, that the Government had no intention of modifying the decision of the Court of Cassation requiring the conversion of the real property of the Propaganda Fide into Italian rentes, has caused renewed solicitude at the Vatican. Cardinal Jacobini, Papal Secretary of State, at once ordered the different nuncios to point out to the courts to which they are accredited the designs of the Italian Government.

The Crown Prince of Portugal will go to Madrid to ask the hand of Infanta Eulalie, the only unmarried sister of King Alfonso.

The London *Times* Madrid correspondent on Thursday telegraphed: "The signs of the approach of a serious economical crisis in Cuba are daily increasing. The continuous fall in the price of sugar is bringing ruin and disaster. Unless radical measures of relief are speedily adopted, the long-suffering Cubans will be driven to courses disastrous for all."

News has been received at Madrid from Cuba that Aguero's force numbers 225 men. It is feared that another filibustering expedition is now fitting out at Turk's Island. Several encounters between Aguero and the Government troops have taken place, the latter being obliged to retreat. On the other hand, the Governor-General of Cuba telegraphed on Friday to the Spanish Minister in Washington that Aguero and his party would soon be captured; that he had only sixteen followers, and that the movement was of no importance.

An Havana letter, dated April 10, received in this city on Tuesday, asserted that the landing of Aguero had caused a feverish state of excitement all over the island of Cuba. The Government was misled as to the landing place of Aguero and sent its troops in the wrong direction, and concealed from the public the news of the first disastrous encounter between Aguero and the few troops he met. It is said that the partisans of those Cubans who favor annexation to the United States are trying to organize a league which will work in favor of that idea.

It was semi-officially reported from Cuba on Monday that Aguero had penetrated the rich jurisdiction of Colon, receiving everywhere on the road accessions of men and horses. He had burned various plantations where help was denied.

The Rumanian Cabinet crisis is ended, the old Ministry remaining in office.

The Chilian Minister to France has announced that a truce between Chili and Bolivia has been proclaimed. By the terms of this it is provided that the Bolivian territory occupied by Chilians shall remain under Chilian law, and that trade between Chili and Bolivia shall be free.

The Government of General Iglesias, in Peru, has been formally recognized by those of Ecuador, Bolivia, Chili, Hayti, Costa Rica, Honduras, Nicaragua, the Swiss Confederation, Denmark, Sweden, and by the Holy Father. The Minister of Foreign Affairs resigned on March 19.

Mr. J. M. Langston, the American Minister at Port au Prince, has demanded of the Haytian Government the payment of $400,000 as an indemnity for the American losses on account of the riots last September. The German claims for the same cause amount to $500,000, the French claims reach an equal sum, and the English claims are $250,000.

The official statistics show that 1,275 miles of railway were built in Canada last year, making a total of 8,805 miles under traffic, and when the lines at present under construction are completed, which will be within two years, the railway system of Canada will comprise over 11,400 miles. The paid-up capital was increased to $494,271,264, or nineteen per cent.

THE BOOM CANDIDATES.

All the newspapers are devoting much space to demonstrations of the actual strength of the various boom candidates, and all of them agree that Blaine is far in advance of all others. He undoubtedly has secured more delegates who are ostensibly in his favor than any other candidate, and his friends are counting them up by tens and dozens in other States where the delegates are still unchosen. The *Tribune*, which retains the position that it held in 1876 and in 1880 as Blaine's organ-in-chief, has a Washington despatch which claims that Blaine has made great advances over his strength in his two previous preliminary canvasses. He is put down as certain of having an almost solid delegation from Pennsylvania, a majority of the delegates from New York, and almost solid delegations from Ohio, Indiana, and a few other States. An enthusiastic Blaine organ at Washington goes further and gives exact figures. It declares that Blaine will have 100 more votes on the first ballot than he had in 1880, that "he is the one candidate for whom there is any popular enthusiasm, and as things are going now he will be nominated on the first ballot by an overwhelming majority."

It is evident that the old plan of pushing Blaine in with a great hurrah is to be tried over again. All the old wires are in full operation, and, as usual, are "worked" from Washington as a centre. Occasionally there is a little talk about the uncertainty of Blaine's being a candidate, but since the publication by instalments of the "history" as a campaign document, most of that has been dropped. Some of the Blaine advocates try to keep up the illusion by saying that they have never been able to get him to say that he is a candidate, and it is only a few weeks since one of them was able to say, with a perfectly grave face, that "nobody, not even Blaine's own wife," knew whether he was willing to run or not. As a general thing, however, all the enthusiastic persons who visit the historian at his quiet house in Washington come away fairly shouting for his nomination, and convinced that nothing in the world can prevent it. It is a most significant fact that all the Democratic journals and politicians are of the same opinion, and are extremely careful about saying anything to dampen the Blaine enthusiasm. We published last week a review of Mr. Blaine's record, for the purpose of raising the question whether or not the Republicans were prepared to enter the canvass with a candidate in whose career there were so many things which it would be difficult to defend; and while many Republican journals have copied our article and commented upon it, we have not seen it reproduced or even alluded to by either a Blaine or a Democratic newspaper. We venture to predict that if Blaine were to be nominated, that record would appear in every Democratic journal in the land within forty-eight hours.

With all its noise and enthusiasm the present Blaine boom is much less formidable than its predecessors. The usual mistake has been made of developing it too early. Blaine saw the effects of this mistake in 1876 and again in 1880, and he was determined to avoid it this year, but old habits were too strong to be overcome. Furthermore, it is doubtful if a Blaine boom could be worked up in any other way. It depends for its success mainly upon having all the Blaine delegates elected early, in order that a show of strength may be made which will develop enthusiasm and discourage opposition. Pennsylvania is always worked up first, and then New York. This year Pennsylvania shows much greater actual strength for him than ever before, and it may be that he will have a few more delegates from New York; but there are few signs of additional strength elsewhere. He must make vastly greater gains before he can have in the Convention anything like his following in previous years.

This year's boom is actually ahead of the usual time. Four years ago the first formal announcement of Blaine's strength was published by the *Tribune* on May 8. Blaine was then shown to have 241 delegates in his favor, while Grant had 224. Blaine's Washington "bureau" was claiming at that time 287 delegates, and was allowing Grant only 191. On May 22 the bureau claimed 323 votes, and gave Grant only 262. On May 28, only a few days before the Convention met, the claim was 324 for Blaine and 276 for Grant. At present about one-half of the whole number have been elected. Of these Blaine is put down as absolutely sure of 100, and his "claimers" say he has 140 now when he had only 49 in 1880. On this ratio of gain they are claiming his triumphant nomination.

Their claims are probably wilder than they were four years ago. His highest vote in Convention then was 285, precisely the vote which he received in 1876, or 39 votes below his claim and 94 votes less than a majority of the Convention. This year's convention will contain 820 delegates — 64 more than in 1880—and 411 votes will be necessary for a nomination. As the Blaine boom, taken at the boomers' own estimate, at present numbers only 140 votes, it is obviously premature to claim his nomination as assured. He is making a great fight this year, but under conditions by no means so favorable as they were four years ago. Then he had the third-term opposition in his favor, and had not his own record as Secretary of State to weigh him down. There was not at that time so formidable an independent vote to threaten his election as there is now, and the foolish expedient of running for the Presidency by assuming to be a historian had not been tried. Indeed, the spirit of the time is more hostile to Blaine and Blaineism than it ever was before, and we await the assembling of the Convention with the serene confidence that he will come much less near a nomination than he did in 1880. We are not sure that his boom has reached its highest point yet—it is likely to make considerable progress before the Convention meets on June 7; but it is one thing to elect Blaine delegates and another thing to induce them, when assembled, to assume the risk of electing a candidate whose canvass will have to be made on the Mulligan letters.

The Arthur boom, on the other hand, so far as the State of New York affords means of judging, is much less significant than Blaine's. The returns from the interior are gloomy and disappointing. Rochester was lost when, by the rules of the game, it ought to have been won. Albany failed miserably in spite of the most persistent use of Federal patronage. Brooklyn went all to pieces, notwithstanding the pains taken to put "Jake" Worth up and "Al" Daggett down. In the rural districts there has been a series of similar mishaps most unaccountable and mortifying. At the last State Convention the Stalwarts had everything their own way. At the approaching one it seems doubtful whether they will have anything their own way. It is quite certain that the idea of securing the vote of the New York delegation at Chicago, or such a majority as will carry much moral weight with it for Arthur, must be abandoned.

It was fair to expect that Mr. Arthur would be a candidate for election by the people to the station which he had reached through a great public misfortune. He had a right to cherish this ambition, but he has sought to reach it by two different and opposing methods or policies which have largely neutralized each other. He has sought to conciliate the bosses and reformers by turns, and has fallen between two stools. A believer in the boss system of party management, and himself one of the most experienced professors of the school, he has nevertheless alienated a large portion of the class who make politics a means of livelihood through what they consider an exhibition of weakness. He has not made removals and appointments altogether in the way or to the extent they desired and thought they had a right to expect. He has yielded a great deal too much to the clamor of the milksops and the man-milliners. Nothing is more contemptible in their eyes than the truckling of a trained boss to such impracticable and unsophisticated persons as George William Curtis and Carl Schurz. A true man, they feel sure, would never have made any such blunders. Such a man would have had Collector Robertson's head in the basket at the same time with Naval Officer Burt's. He would have had every office filled with henchmen—his own henchmen—long ago; and as for Dorman B. Eaton and the other greenhorns, they would have been sent packing before they had ever begun to fill the Washington clerkships with Latin grammar and the rule of three.

President Arthur has yielded just enough to the reformers—and by these we mean no particular organization or coterie, but rather the prevailing spirit which has taken hold of the ordinary mind in proportion as old issues have dwindled in importance—to put the Machine managers and "war-horses" in low spirits. He has not yielded enough to gain the confidence of the other side. When he appointed Judge Gray to the Supreme Bench there was general satisfaction and acclaim among the sober-minded and influential classes. This being one of the earliest acts of his Administration, it was taken as a standard by which his subsequent ones should be gauged and tested. It was speedily followed by the appointment of "Bill" Chandler as a member of the Cabinet. A more disreputable political trickster could not have been drummed up within the limits of North America. All the merit implied in the appointment of the new Judge

of the Supreme Court was eclipsed by the selection of the new Secretary of the Navy, and it remains an unsolved mystery to this day why such an appointment was ever made. As Chandler belonged to the faction opposed to the President, it was concluded that his elevation was part of a "deal" respecting the next nominating convention. But as the new Secretary had no votes to trade on except those of New Hampshire, while he was justly odious to the better portion of the party everywhere else, the "deal," if there was one, did not promise any remarkable dividends to Mr. Arthur, nor has it yielded any.

Patronage has been Mr. Arthur's Nemesis, and it is instructive to observe how completely the credit of an otherwise useful and respectable Administration may be wrecked by the disposition made of a few insignificant offices. In all that which relates to public measures, Mr. Arthur has been generally discreet, conservative, and just. In this regard his Administration has been more acceptable than President Garfield's seemed likely to prove at the time when Blaine was bullying Chili and seeking grounds for dispute with European Powers respecting the Panama Canal. But the appointment of a bad Collector of Customs at Philadelphia, or Boston, or Albany, or the appointment of a good one for bad reasons, will, in the present temper of the public mind, belittle and obscure the most important public services. The removal of Colonel Burt from the Naval Office in New York, for example, alienated from Mr. Arthur the major part of the independent vote of the city, and produced a most unfavorable impression throughout the State. Local squabbles about postmasters, and weighers, and surveyors having reference to the control of the party organization, leading up to the nomination of Judge Folger for Governor, and the choice of John F. Smyth as the party boss, and ending with 200,000 majority for Cleveland, put a dreadful blight upon Mr. Arthur's prospects. General good behavior and prudent administration were made of small account in comparison with this unexampled party disaster. Up to that time there was every reason to suppose that he would receive the nearly unanimous support of his own State for a renomination. Since then he has never had a chance of getting it. The moral of it all is plain enough. The conflict between the old and new systems of government is as irrepressible as the conflict between slavery and freedom was twenty-five years ago. No public man can serve both. He must choose, and abide the consequences of his choice.

A STUDY IN CITY GOVERNMENT.

THE movement in favor of suffrage in Washington is full of interest for the inhabitants of this and all other large cities. The municipal problem there is different from ours in some respects, but it involves the same fundamental difficulty—that of getting a number of elective offices well filled by means of a vote such as that of a large city must be. For many years, in fact down to Boss Shepherd's time, Washington had an old-fashioned mediæval government, with all the various "branches" that have been carefully handed down to us by the fathers, with a suffrage at least as bad as can be found in any Northern city, but different, because it was principally made up, since the war, of ignorant negroes. The city went through a process very similar to that which we know so well at the North. The "boys" ran the primaries, and the taxpayers took no thought of the morrow, and the city having begun its career as a winter capital, through an influx of rich Northern immigrants, in the fulness of time a "boss" was evolved, who got the "boys," and the primaries, and the "branches" all under his thumb, laid out wide streets and avenues, started a brisk speculation in lots, and made improvements which really converted Washington from a squalid, muddy village into an attractive city. Unfortunately, like other bosses, he did the work by dishonest means, and he used his improvements in such a way that they began to look like mere machinery to plunder with, and then the taxpayers rebelled, and the boss was "bounced."

After this unfortunate failure of popular government, a new and strange experiment was tried—stranger than anything ever resorted to in New York, or, so far as we know, in the United States. Congress established absolute government in the District. It took away the right of suffrage altogether, vested the government in a commission of three members, the most important of whom, the head of the public works, was an officer of engineers—a government, as Mr. John Cochran would say, not of laws but of men; indeed, of a military man at that. In place of a Mayor and a "legislative branch" and a Shepherd, and dozens of bureaus and heads of departments, Washington was governed solely by the late Major Twining, and a very good and honest government the Major was found to be, as long as he lived. While his life lasted the sewers were laid, and the streets lighted and paved and swept, without a ballot being cast, or a convention held, or a hall hired, or either the Republicans or the Democrats "reorganized." The city government was a despotism, and the good Major and his associates on the board were the despots. The taxpayers were mightily pleased, and went about openly congratulating each other on the loss of what is supposed to be the freeman's dearest right.

But of course this state of things could not last. One day the Major died. Whether his successor is as good a despot as he we do not know; but at any rate, the vacancy was made a pretext for raising a question as to the form of government, and a movement was set on foot to restore its liberties to the down-trodden city. This movement, it must be observed, was not got up by the taxpayers, but by that vague body known as "the people." The people, it was said, wanted popular government. They were tired of being governed by a military despotism, and wanted the ballot back again. To this it was replied that the experiment had once been tried and failed; that in fact it only resulted in plunder, and the taxpayers vehemently protested against Congress restoring suffrage.

In the midst of the discussion the matter was put to a curious kind of test. Although the right of suffrage had been taken away, the right to hold primaries had not, and once in four years both parties hold them for the purpose of sending delegates to the National Conventions. This year it was resolved by the "people" to exert a moral influence upon the whole country by sending men to Chicago who would demand that their rights should be restored. So on Monday week the Republican primaries met, and the taxpayers, pleading in their timid way fear of bodily harm, stayed at home. The result, it must be said, justified the taxpayers. The primaries were, without exception, riotous and disorderly, and with few exceptions they broke up in fights. The knife of the wronged white voter and the razor of the down-trodden African were drawn; fists, stones, and sticks were used. Many an unpopular candidate was stabbed out of the field, and in a majority of cases a "full line" not only of delegates, but contestants, was the result of the fight. The survivors were delegates to the District Convention, and as soon as that body met, the police had to be called in, and within half an hour an ambulance was sent for to carry away the wounded. This incident will probably go far to confirm Congress in the belief that, in a city like Washington, popular government merely means the right of the "boys" to levy taxes for the support of themselves and their families.

CHARLES READE.

NOTHING is more remarkable in the literary taste of our day than the extraordinary rapidity with which it changes. From the time of the publication of the first of Scott's novels, English literature has been marked by the appearance of many great writers of fiction, who have each in his different way achieved a sudden and extraordinary popularity, as to the permanence of which the most diverse opinions, so far as definite opinions exist, are now held. Among these there is none whose place is more difficult to fix than that of Charles Reade. Dickens, Thackeray, Bulwer, Disraeli, George Eliot, Trollope—from all these he was very different, and perhaps Dickens is the only one between whom and Reade a connection can be clearly traced. But this connection was rather moral than literary. The same hatred of oppression, injustice, and wrong which made Dickens almost as much a reformer of social abuses as a literary man, led Reade to expose the horrors of prison discipline and the terrors of private lunatic asylums. He differed from Dickens, however, at so many points that a comparison between the two runs great risk of misleading. Even in his philanthropy he was different. Dickens throughout his whole life was inclined to impute to the "upper classes," the well-to-do, the prosperous part of the community, an accountability for the evil which he found in the world, which to us seems exaggerated. All his sympathies were with the class from which he originally sprang. He was never able, as has been said over and over again, to draw ladies and gentlemen, and was fond of representing them as awful examples of cold-blooded selfishness. This fallacy Reade entirely avoided. His interest was in characters and situations, and the distinctions

of classes counted for very little with him, except for dramatic purposes.

At the time of his death his reputation had suffered a serious decline, owing to the fact, among others, that he appeared to have done his best work, and to have become reckless as to his position. But in the case of a writer of his importance, it is, after all, his best work which counts, and for the public which greedily devoured his novels, Reade will be remembered as the author of 'Peg Woffington' and 'Christie Johnstone,' and 'Never Too Late to Mend,' when the affectations and exaggerations of his later books have been quite forgotten. He was cursed from the first with a passion for what can only be called stage effect. He was not content with the natural vigor of a thoroughly masculine style, but he continually attempted to reinforce it by tricks and devices which were sometimes amusing, sometimes contemptible, and always weak and trivial. These were, however, it is only fair to say, closely connected with a great natural dramatic taste, which he put to use in a variety of plays more or less successful. Reade, however, cannot be considered mainly a dramatist. Even the dramatized version of 'Peg Woffington' is inferior to the original.

But after all abatements and allowances are made, there is in his best books that touch of nature, that power of sympathy and insight, that feeling for the elementary passions which sway human life, which we find in only a few great writers of fiction. His range was perhaps not very great; his heroines all bore a strong family resemblance to each other; his men were not characters taken from life, like Thackeray's, but they were made of flesh and blood, and hoped and feared and loved and struggled, so that their life was for the time our own. Who can read one of his sea stories without a share of the wild excitement with which they are filled? Who can avoid falling in love with his soft, charming, untruthful heroines? Who has not laughed over his wonderful children? Who has not grown indignant with him over the misery and cruelty and injustice produced by inhumanity and greed? Whatever may be considered the true view of the connection between morals and literary art, it is impossible in the literature of the English race to divorce the two, and, as has been already said, many of Reade's novels were marked by a distinct moral purpose. For the production of 'Griffith Gaunt,' however, he was found fault with on the score of immorality—a strange charge, as his admirers contended, but one which undoubtedly affected his standing with a public very sensitive on this point. By this book, which was a sort of *tour de force*, we do not believe he will in the long run be very much tested, any more than Thackeray's fame is likely to rest upon 'The Virginians,' or Dickens's upon 'A Tale of Two Cities.' With him, as with most other great novelists, the men and women he knows best and could paint best were those of his own day and country.

PROSPECTS OF MR. GLADSTONE'S GOVERNMENT.

LONDON, April 3.

THE close of last session left Mr. Gladstone's Ministry in a position as strong as they had ever occupied except during the first few weeks of their entrance on office, when the difficulties that were to beset them had not yet been revealed. Their party was thoroughly loyal and united, their Tory antagonists were discredited by repeated failures in debate and by internal dissensions. During the autumn and winter recess a spirited and well-sustained attack was made by Tory speakers through the country upon every part of the Government policy. But this campaign was almost without effect. The country listened, and liked the gentle excitement which repeated volleys of invective, answered promptly by ministerial speakers, supplied to it, but it did not seem to be moved by anything the Opposition said. Meantime, however, difficulties began to thicken in Egypt and the Sudan, and a vague uneasiness grew up. When the new year came, there was a general feeling that the Sudan policy had been wanting in promptitude and decision. This was partly allayed by the despatch of General Gordon; but it was renewed by the defeat of Baker and the troubles on the Red Sea coast.

The opening of Parliament did something to restore confidence, for the Government gave their explanations; and when Mr. Gladstone's policy was formally challenged by the Opposition, his powerful speech in reply, and that disposition to rally to a leader which becomes so strong under a party system, strengthened the Ministry, and appeared to give them a new lease of life. A further stimulus was supplied by the County Franchise Bill, a measure to which the whole party stood pledged, and which recalled its old contests and triumphs. In bringing it forward the Government played their best card, opening the main struggle of the session on ground which they considered the most favorable to themselves.

Meanwhile, however, two influences have been at work, both of which tend to weaken the Government, and whose force is by no means exhausted. The first is dissatisfaction with their behavior in Sudan. There are, of course, two very different views held inside the Liberal party on that subject. Some of the moderates are touched with what is called here imperialism, and would be well enough pleased to see the Government declare that they mean to hold not only the Red Sea coast, but Khartum also, while still more desirous that a protectorate over Egypt should be formally proclaimed. The Radicals, on the other hand, who see with regret that we cannot now escape from Egypt, are utterly hostile to any further responsibilities or annexations, and desire to see the whole Sudan left to its fate. But both these sections, as well as many persons who cannot well be referred to any particular section, are united by their anxiety as to Gordon's position at Khartum. Since it sent him out with full powers in the middle of January, the Cabinet has done little or nothing to support him. He has no British troops; he was not able to carry with him the sum of money supplied to him; he has to rely solely on his own gift of impressing and ruling the people. The spring is now so far advanced that it is believed to be practically impossible to despatch troops to him across the deserts. The fighting on the Red Sea coast near Suakim has done nothing to strengthen his position; and that fighting itself, undertaken against what had been supposed to be the pacific policy of the Ministry, and producing no substantial result, has only increased the prevalent impression that the Government have no settled policy, but are merely doing the best they can from day to day. I do not say that this is the case, but merely note the fact that victories have rarely been gained so creditable to the valor of our troops which have given so little pleasure at home. The chief feelings in England were admiration for the marvellous courage of our enemies, and perplexity as to why we were killing them at all. Liberals, who had denounced the Afghan war of 1878 and the Zulu war of 1879, asked themselves what they would have said if the battles of El Teb and Tamanieb had been fought by the orders of Lord Beaconsfield, and received the news of our triumph in melancholy silence. Thus the total result of the last five months of African policy has been to sap the confidence of the Ministerialists in the vigor and foresight of their leaders, and to induce many to explain their apparent indecision by the hypothesis of divided counsels. Rumors are constantly flying about that this or that group of Ministers is in conflict with the majority of the Cabinet—rumors probably incorrect in details, but which witness to the direction of men's minds.

The other cause which operates against the Government is the paralysis of the House of Commons. There has probably never been a session when it was found so hard to advance public business. The number of questions put to Ministers at the beginning of each sitting—a number which formerly rarely exceeded twenty—has now risen to an average, on Mondays and Thursdays, of sixty or seventy, and on other days of thirty. Most of these either relate to trivial matters of administration, or are repetitions of other questions put before on topics of Egyptian policy. Besides those which are printed beforehand, so many others are put on the spur of the moment that nearly two hours are usually spent, on Government nights, in answering them. Whenever a pretext can be found, some fresh debate on the Sudan is raised, while ordinary subjects, even those that are scarcely controversial, are discussed at inordinate length, sometimes by the Conservative Opposition, sometimes by the followers of Mr. Parnell. To find time for the pressing business of supply, the Ministry has been forced to encroach on the time reserved for private members, and to take the unusual course of making the House of Commons sit on Saturday. After two months, not a single bill of importance has made substantial progress, and the probability of getting a tolerable harvest of legislation has already become slender. This is of course the object of the Opposition, who, seeing a general election not far off, seek to retort upon the Government the charge, so often brought against the last Tory Government, of having neglected domestic interests. Week after week passes, and things grow worse instead of better. When the Ministry complain, the Opposition fix them with a fatal dilemma. In the autumn of 1882, a special session of Parliament was held for the purpose of amending the rules of procedure, when the Ministry carried through certain changes which they declared to be necessary to expedite business. If the new rules then passed were proper and sufficient, why do not the Ministry use them? If they were insufficient, is it not the fault of the Ministry, who with their large majority could have passed whatever rules they required? Nearly all the Liberals now admit that the new rules were insufficient; that they were aimed only at that open and coarse form of obstruction which the Irish Nationalists had used against the Coercion Bill, and do not touch the more subtle and delicate obstruction which is now incessantly practised. But the Government is ashamed to own itself mistaken, and tries to work along with the present rules, weak as they are.

Under these circumstances it is not wonderful that the Liberal party should have become more despondent than at any previous time since 1880. Nor is the despondency confined to Parliament. It has spread to the country. The sturdy Liberals of the northern towns and Scotland, though

they have never liked the expedition to Egypt, and have disliked our conduct in Sudan, do not greatly care about these foreign troubles, and would be slow to forsake the Ministry for any such cause. They have full faith in Mr. Gladstone's character and purposes. But they are astonished and disheartened at the stoppage of the Parliamentary machine. What more, they ask, could they have done than send up a majority of more than one hundred at the last general election? Why should such a majority, led by a Cabinet of brilliant men, be unable to have its way, and settle those questions which the people really care for? The first two or three sessions of this Parliament were occupied by Irish affairs. But this is the second year during which Mr. Gladstone has refused to touch Irish affairs because English and Scotch questions must have their turn. Yet little was done for England or Scotland last year, and less seems likely to be done this year. The discontent is so great that it attaches not merely to the Government, but to our Parliamentary system itself. If there were any alternative for that system, men would begin to discuss it. There is, however, none, so the complaints one hears on all sides are as useless as they are bitter.

There is, however, one ray of light in the ministerial sky. It comes, as it has often come before, from their antagonists. The Conservative leaders have shown an extraordinary incapacity, not merely for debate, but for Parliamentary strategy. They are always aiming, but they never hit. They are attacking, now here, now there, but their attacks are so ill directed as to be easily repulsed. They have so persistently refused to propound any policy, or do anything but criticise, that the country believes they have no policy to offer. Lord Salisbury is distrusted for his rashness and Sir Stafford Northcote for his flaccidity. None of the other ex-ministers has any hold on the country; and the youthful favorite of Conservative clubs, Lord Randolph Churchill, is not taken seriously by the sober men of the party. Thus it happens that even those Liberals who are most disaffected to their own chiefs do not feel drawn towards the Opposition.

It may occur to American readers that the state of matters I have described may be due to Mr. Gladstone's age and physical feebleness. It is remarkable, however, that although his age shows itself in his slower recovery from slight ailments, his mental and even bodily powers seem unimpaired. He has never spoken with more power and brilliance than in this very session, nor is there any sign of his caring less about politics or seeking to deprecate further political change. This sweeping Franchise Bill, whose second reading is still being debated at tedious length, is the best proof of his sanguine vitality. Y.

THE SOCIAL MOVEMENT IN ENGLAND. —IV.

LONDON, March 26, 1884.

WHAT is the probable outcome for good or bad of the social movement? This is an inquiry to which your readers may reasonably expect some sort of answer, in this my final letter on a subject which can hardly have been as interesting to them as it is to myself.

Two proposals recently laid before Parliament —namely, Mr. Broadhurst's bill for converting leaseholds into freeholds, and Mr. Bryce's bill for giving Scotch tourists the right to wander at their will over mountains and moorlands— are for our present purpose full of instruction. The one measure has, it is true, been rejected; the other is certain not to be passed by the present House of Commons. But they each point clearly to the kind of benefit which the social movement, or rather the prevalence of the sentiments which are the cause of that movement, may confer upon the country. Law, and still more public opinion (which is at once the cause and the result of law), will, as time goes on, compel, or rather induce, the rich to use their wealth far more than they have hitherto done with a view to promoting the interests and the pleasures of the people. I purposely use the word "induce," because the anticipated change in the mode of using property, should it ever take place, will, I am convinced, flow quite as much from an alteration in the feelings of the rich as from any increase in the political power of the poor. On this point nothing is more significant than the nature of the opposition to proposals like those made by Professor Bryce and by Mr. Broadhurst. It is no exaggeration to say that plans far less revolutionary, far less socialistic, than Mr. Broadhurst's bill would, fifty years ago, have been resisted by every man who owned an acre of land or ever hoped to have a balance of fifty pounds at his banker's, as the harbingers of revolution, confiscation, and a reign of terror. Even thirty years ago and less, my friend the Regius Professor of Civil Law would, for his "Access to Mountains Bill," have been denounced as a Socialist and the patron of an agrarian law.

The 'Life of Frederick Denison Maurice' proves, if evidence were wanted, that men who anticipated the coöperative movement were in 1849 or in 1850 considered Jacobins engaged in undermining the foundations of society. Whoever wants to see what a change has come over the convictions, not of the populace but of the well-to-do and respectable classes, should read the Attorney-General's admirable reply to Mr. Broadhurst's proposal. Sir Henry James is not a Socialist. He is hardly a Radical. He is, from his position, the official representative of what they used in France to call "law and order." What, then, is the nature of his objections to Mr. Broadhurst's proposed scheme? They are admirably-put criticisms upon the details of the bill. They show to demonstration that this bill could never pass into an act. But the Attorney-General's line of attack amounts almost to an admission that Mr. Broadhurst's object is attainable and worthy of approval. Look, again, at the general sympathy with which Mr. Bryce's bill has been received. Land-owners are put out at the energetic public spirit of the member for the Tower Hamlets. The persons who possess tracts of land in the Highlands would have preferred that he should confine his attention to the reformation of city charities. But ordinary men who consider that the land of England, after all, should be used with a view to the interests of all Englishmen, are well enough pleased that somebody should prevent Scotch mountains from being monopolized for the enjoyment of a rich and very limited class, just as merchants and tradesmen who know that it is rapidly becoming impossible to purchase a freehold in London look with no disfavor on Mr. Broadhurst's attempt to enable the thousands who live in London houses to become, on fair terms, the owners of the houses in which they live. The plain truth is, that while Englishmen are firmly attached to the system of private property, they are more and more inclined to think that property, and especially property in land, ought to be so used that many persons besides the owner should have some benefit or enjoyment from it. The ideal state of things, says a philosopher of the ancient world, is that the ownership of property should be private, but that the use of it should be public. "The state," writes F. D. Maurice, "cannot be communist, never will be, never ought to be. It is by nature conservative of individual rights, individual possession. . . . The Church, I hold, is communist in principle, conservative of property and individual rights only by accident." Each formula means at bottom one and the same thing. The existence of private property is the foundation of society. The existence of a moral feeling or religious conviction that private property must be used with a view to public benefit, and that the owners of private property may find it a happiness no less than a duty so to use it, gives the best hope of peaceful progress and of the spread of true civilization. This doctrine of philosophers is becoming a general belief, and the great benefit which the social movement in England may confer, not only upon England but upon the world, is that it may, by the influence both of law and of opinion, so mould the tenure and regulate the rights of property as to show that all that is rational in socialism may be combined with all the inestimable benefit of respect for individual rights and the strict maintenance of private ownership.

Whether the movement at present going on in England will attain its end, or, like so many other movements, either come to nothing or entirely miss its mark, no sensible observer will venture with any confidence to predict. What, however, is quite certain is, that the prevalent notion that increased interference by the state can produce great benefit to the mass of the people is likely to produce several evils, which may be evils of no small magnitude.

First. The effort to improve the condition of the people by means of state interference must, under the circumstances of English life, produce among the poor a state of feeling toward the rich which is at once bitter and, what is worse, most unjust. The easiest, perhaps the only way of arousing general attention to the existence of great evils, such, for example, as the condition of many of the dwellings in which the poor of London live or exist, is to make free use of agitation, exaggeration, and denunciation, or, in other words, to make bold statements of which the truth is far less certain than the effectiveness. Mr. Plimsoll, in this respect, is the very type of the virtuous agitator. No one can doubt his benevolence or his good intentions. Few persons who are not shipowners will deny that the sufferings the sight of which drove Mr. Plimsoll and his hearers all but mad, were and are real. But no clear-headed man can doubt that Mr. Plimsoll's well-meant though ineffective efforts to save the lives of sailors have created a widespread and most unjust belief that shipowners are, as a rule, villains who draw their riches from the reckless sacrifice of human life. Yet, as Sir Thomas Farrer has well pointed out, the prosperity of our mercantile navy is proof that in the main the merchants of Great Britain have done their duty. England enjoys the carrying trade of the world, not because British vessels are rotten and British merchants are rogues, but because, on the whole, British ships are more seaworthy, British captains are more trustworthy, British crews are more skilful, or, in other words, because British sailors are on the average exposed to fewer preventable risks than the sailors of other nations.

The agitation, again, to improve the dwellings of the poor has its birth in the success of one or two sensational publications. The "Bitter Cry" and other writings of the like nature pointed out the existence of real though (probably) decreasing evils; but they unfortunately suggested the inference that the miseries of the poor resulted in the main from the misdeeds or crimes of landowners. In these two instances, in short—and they are mere specimens of a large class—the cry for state interference is based upon and propa-

gates the delusive notion that a grievance is the same as a wrong, and that every grievance is caused by the definite fault of some assignable wrongdoer. It is hardly possible to foster a more natural and at the same time more hurtful delusion. What adds to the danger of teaching men who are poor, and therefore who, speaking generally, endure much suffering, that everything which is wrong may be attributable to some wrongdoer, is, that the condition of English political life has of itself a tendency to stimulate the mutual hostility or suspicion of large classes among the nation. Government by party—a system which has, to my mind, great merits—has the grave inconvenience that it keeps alive among party leaders a habit of factitious invective and unreal denunciation. It, moreover, makes the temptation to use the social movement as a means of political agitation almost irresistible. Lord Salisbury, I do not doubt, feels a genuine pity for the poor, but his lordship and his lordship's followers are, one may fairly assume, all the more zealous about housing the poor because a Conservative leader, and still more the followers of a Conservative leader, are glad to convince themselves and the world that the Tories and not those wicked Radicals are the true friends of the people. We cannot suppose that Cobden and Bright enjoyed the less exposing the fallacies of protection because protectionists were in England land-owners and aristocrats. And the country gentlemen who promoted the Factory Acts, though their humanity was undoubtedly shocked, and rightly shocked, at the miseries of overworked children, certainly found that the duty of denouncing cruelty was all the easier to perform because the cruelty done in factories could be attributed to the manufacturers, who were the zealous supporters of free trade in corn. The simple truth is, that party government is a system ill fitted for dealing with evils which are social rather than political, and that the existence of political partisanship considerably increases the risks of every great social movement.

Secondly. The true dangers which menace the prosperity of Great Britain are economical. A change in the course of trade would damage the country far more seriously than any conceivable alteration in the Constitution. Now, for various reasons which will easily suggest themselves to your readers, it is clear that the economical prosperity of England turns on the strictest obedience to the soundest rules of political economy. But there is nothing more probable than that, in the attempt to confer benefit on the people, the Government of Great Britain may adopt measures which every well-instructed man knows to be economically unsound; and this for two reasons. The first is, that many plausible forms of state help are in reality only protection under a new name. The second is, that on economical subjects the prejudices of the very rich and the very poor, oddly enough, in England, at least, coincide. The fallacies of socialism are nearly allied to the fallacies of protection. Chartists more than once interrupted meetings of the Anti-Corn Law League, and the reform in the poor-law was as unpopular with the squires as with the laborers. Indeed, one of the most obvious and forcible objections which can be raised to the extension of the franchise is the probability that democratic constituencies may favor alterations in the working of the poor-law. Other considerations outweigh, in my judgment, as in that of most Liberals, the argument I have mentioned, but that it has weight no honest economist can deny. We see ever before our eyes the sort of conflict which may arise between the impulses of benevolence and economical considerations. Nothing appears at first sight more just than Mr. Chamberlain's proposal to forbid the insurance of ships above their worth. But it is objected by his opponents that restrictions on insurance will greatly hamper trade, and, moreover, transfer the business of insurance from English to foreign, and especially to American, companies. Of the truth of this assertion, or of the weight which, if true, is due to it, I can form no opinion. I refer to it only as a curious example of the great difficulty of interfering with individual freedom of action, without incurring at least the risk of in some way damaging the trade of the country.

Thirdly. The greatest yet the least perceived evil resulting from any large scheme of state interference is the necessity of monopolizing the talent of the country for the service of the Government. The number of capable men which any country can produce is limited. For every man of capacity whom you have in a Government office, you have one man of capacity the less in a counting-house. To this must be added that, on the whole and with rare exceptions, the work to be done in a Government office must be work of routine. We sneer at red tape, but red tape is a useful article in its place, and its place emphatically is a Government department. The result is, that the transaction of the business of state is an employment which does not encourage originality or resource. If the talent of the country be diverted from private business into official business, the affairs of Government will, no doubt, be better managed than at present. But the nation will not after all get as much good from the talents of its most competent citizens as at present. No doubt this consideration is of rather too general or abstract a character to be of much direct immediate importance. It is one, however, which deserves attention.

All the criticisms, in short, on what I have termed the social movement, resolve themselves into this: The social movement in England represents a demand for the interference of the state in the interests of the people. The one thing which is certain is that you cannot in politics, any more than elsewhere, have your cake and eat it. You cannot hope to have the benefits at once of active state interference and of adherence to the system of laissez-faire. Now it is by adherence to this system, especially in all matters of trade, that England has obtained unexampled wealth and prosperity.

A. V. DICEY.

CARLO CATTANEO AND THE FIVE DAYS OF MILAN.

MILAN, March 23, 1884.

SIX and thirty years ago, after five days' fierce combat, the Milanese, unarmed, drove out the last Austrian from Milan. This wondrous and successful revolution was led by Carlo Cattaneo, a profound thinker and eminent philosopher, who, between 1819 and 1847, as Professor of the Lyceum of Santa Marta, and as editor of the monthly review, the *Politecnico*, and of scientific annals, had educated two generations in the principles of positive philosophy and its practical application to every-day life. Born and bred in this city, where, from 1814 to 1821, the Milanese did nothing but conspire for the overthrow of the Austrians, he, a witness of the failure of all their attempts, conceived an aversion for all unprepared revolutionary efforts. Hence, when, on the morning of the 18th of March, as he was writing the manifesto of a new paper to be entitled the *Cisalpino*, the youth whom he had taught to translate theory into practice burst into his study, exclaiming, "Master, the hour is come; guide us, and we will drive out the Austrians from Milan!"—"You have no arms," he answered, trembling at the responsibility they cast upon his shoulders. "Arms or no arms," they insisted, "with you or without you, we shall risk all; your counsels may decide the victory, your obstinacy cannot prevent the struggle." He threw his proof-sheets into his desk, and in an instant his prudential hesitation was transformed into audacious resolution. Chosen, with three other citizens, to compose a council of war, he was from first to last recognized sole captain by the people and the *jeunesse dorée* who, in kid gloves and dressed in the last Parisian fashion, just as they quitted the balls and salons, lived, fasted, and died on the barricades. How Radetzky despised those "dandies" on the 18th! How he cursed their "profound dissimulation" on the 22d! Well might he stand amazed. On the one hand the city, totally unarmed; on the other, 16,000 Austrians, armed with all that in those days rendered an army formidable, within the walls, and the four fortresses garrisoned as for a siege. For the insurgents, no communication from without, no certainty of support from Piedmont. Nothing daunted, Cattaneo set to work. He knew all the weak points of the enemy, all the chances for the insurgents; despatched short, precise orders with lightning speed; organized the barricades; found work for women and children on the roofs of the houses, and time between whiles to calm the fears of the terror-stricken aristocracy, and of the trembling, bewildered municipal authorities.

Bolza, the head of the Austrian police, the most accursed of mortals in the eyes of the Milanese, whose sons and fathers he had murdered, tortured, exiled, or imprisoned, fell into the hands of the people, who came to Carlo to decide his fate. "If you execute him, you perform an act of justice; if you spare him, you do a holy deed." And Bolza was spared. With such vigor were the Austrians assailed, that on the third day they were compelled to abandon their posts in the city, and Radetzky offered an armistice of fifteen days, which Casati, the Mayor, whose son had wept to find him hidden in a garret, was clamorous to accept. "Never!" said Cattaneo, brushing off the cobwebs from the Mayor's coat. "Even were we to sanction such cowardice, you could not tear our people from the barricades." "You could if you chose," retorted Casati. "I do not choose. For three days our tocsin has echoed among the neighboring villages and towns; if we accept an armistice, we must remain inert spectators while the Austrians murder our friends hastening to the rescue." To Radetzky's messengers Casati answered: "Signori, you will represent to his Excellency, on the one hand, the readiness of the municipal authorities to accept the armistice; on the other, the resolution of the combatants to die at their posts." To those who proposed to blindfold the messengers, Cattaneo answered, "There is nothing to hide"; and one of them, struck by the strange disparity between moral resolution and material force, turned at the gate of the city, exclaiming, "Addio, brave and dauntless people!"

Again, on the 22d, Radetzky proposed a second armistice, and the municipal authorities and the aristocracy pleaded for its acceptance, urging that it would be all in favor of the insurgents, afford them time to provision the city, which contained but food and ammunition for twenty-four hours, and time for their partisans without to come to their aid. "The enemy," answered Cattaneo, "has furnished us with food and powder so far. Twenty-four hours' feed and twenty-four hours' fast will suffice. *Del resto*, better to starve than swing." All the insurgents echoed the verdict. On the 23d, the last of the five days, the enemy fought for six hours at the bastions of Porta Josa. In the eve-

ning the citizens forced the gates and opened communication with their friends, while Radetzky commenced his precipitous flight *toward* the fortresses. Had Cattaneo's counsels still been followed those fortresses would never have been reached.

Meanwhile, a messenger arrived from Charles Albert, promising the assistance of Piedmont if the city should first be ceded to the King. "Signor Comte Enrico Martini," wrote Cattaneo from the Office of War, "the city belongs to the combatants who have freed it. We cannot now summon them from the barricades to deliberate. If Piedmont come forward generously, she will be welcomed gratefully by men of all parties and opinions. Gratitude is the only word which to-day can silence that other word, 'Republic.'" But the aristocracy, which had quailed before Austria, crouched at the feet of Charles Albert, and the history of the following weeks is summed up by Colonel Forbes: "While Radetzky was collecting bayonets, Charles Albert was collecting votes." Had the war been vigorously and instantaneously followed up—regular forces and partisan warfare combined—the Austrians, beaten and demoralized, must have quitted Lombardy, and Lombardy would inevitably have annexed herself to Piedmont. But the golden quarter of an hour was lost, and Radetzky was as keen as Garibaldi in "profiting by a fair wind." Among Cattaneo's papers are a series of letters to Sir Robert Campbell from his own correspondents at the camp. He gave them to Cattaneo with permission to publish them, without the names of the writers. They furnish absolute proof of the above assertion, and will be invaluable to the dispassionate historian of the Revolution of 1848.

By his stanch opposition to all that savored of parley or delay, Cattaneo added the hate of the Fusionists to that of the Milanese aristocracy already concentrated on his head; and though there was not a grain of vanity in his composition, though he had not sufficient personal ambition, his *amour propre* was intense, and, in common with many of his countrymen, his susceptibility rendered him thin-skinned to a degree that no American could understand. The intense hatred conceived by Cavour and the strictly Piedmontese party was carried to such a point that, even after the liberation of Lombardy in 1859, he was prevented from occupying a chair of philosophy, or even from taking part in a commission for which Signor Jacini, the president, was anxious to secure his services. He lived from 1848 until 1869 in poverty at Lugano, dying in that year in the month of February in his eyrie on the mount of Castagnola. During several years of our exile, Cattaneo's friendship was our sole solace, and Alberto Mario is now considered in Italy the representative, exponent, and disciple who completed his master's work.

I can hardly give a better idea of what Cattaneo was for his friends and his country than by translating two letters, the first from Cattaneo to Carlo Pisacane, who gave it to me on the eve of his departure for the fatal expedition of Sapri:

"December 29, 1851.

"DEAR FRIEND: The kingdom of the Burgraves of every color has fallen—*Laqueum quem posuerunt inciderunt in ipsum.* They are caught in the traps of their own police, of their own gendarmes, of their own prefects. Their own priests sing the Te Deum. Bravo, Signor Falloux! Bravo, Signor Oudinot! The Pope treats you in Pope's fashion. Despairing of curbing the Revolution, they have evoked the enemy from the tombs; but an enemy is not a friend.

"The Empire is not the *status quo*, it is incompatible with the *status quo*. It is a general unstable equilibrium. Napoleonism is a system; it is the preponderance of France in Europe. It has its own essentials, even as the circle and the triangle; and with geometry there is no compromise. In the beginning of the year we shall have the Empire, in carnival the wedding, then the struggle for the Rhine and for the Po. The 2d of December is somewhat Borgian in its style, minus dissimulation. The Man of Strasbourg, of Boulogne, of Satary, is no deceiver. 'Who is warned is half saved,' says the proverb, 'but who heeds not warning can be saved by none.' The bee-hive of the socialists was better than the nest of the vulture. The French have wearied of good, they may weary of evil.

"Well, I am past fifty. I wrap myself up in my toga and look on. You are young and a soldier. If there are eggs to be broken you should have a hand in frying them. In any case of war you should seek experience, a grade, a name; time and opportunity will not be wanting to use such gains for Italy and liberty."

The second letter is one written to me by Dr. Agostino Bertani, the day after the death of our beloved friend:

"GENOA, Feb. 17, 1869.

. . . . . .

"When, little more than two months since, Cattaneo accompanied me to the bedside of Mazzini, then seriously ill, he too was ailing; and I, moved by that scene of affection and by that meeting—a true episode of our history—contemplated sadly from the foot of the bed those two men so dear to Italy, and trembled for the life of both, and, stifling the consciousness which professional intuition forced on me, sought to divine which of the two was most enfeebled, nearest to the end. Anticipating the misery of the survivor, I redoubled my prayers and efforts to induce both to be more careful, more jealous of their lives. Cattaneo had but to trust to his robust temperament, to rest, to adopt a regimen which should repair the ravages of the depressing blood-letting system incautiously practised, and submitted to by him with too much tolerance. That evening, which I will describe to you when we meet, was a sadly solemn one for me; but I did not then believe that Carlo's ailments were so soon to destroy his life.

"Carlo's death agony was of the most painful; and from the precise movements of his hand, which moved slowly over his brow and lips, I incline to believe that he was conscious to the last, but powerless for any manifestation whatsoever.

. . . . . .

"If I could have believed in a miracle, I should have expected it in answer to my wild invocations. I cut off a lock of his hair, pressed every power of art into the service to save from oblivion the form of that so beautiful head; but at last I needs must leave him. I laid him myself in the coffin, surrounded him with flowers, and placed the cap so that the spacious brow remained uncovered; then I gave him a last kiss, and veiled the face that yet exhaled all the serenity of his soul. Finally, the fatal coffin-lid closed over our friend."

This same faithful friend and celebrated surgeon last Thursday, the 19th inst., telegraphed to me: "I am going to the Monumental Cemetery. Come." I went, and arrived at the very moment that the coffin of Cattaneo, closed by him fifteen years ago at Lugano, was being opened, in order to verify the remains before transferring them to the sarcophagus prepared in the Famedrio. To our amazement, as no embalming process had been adopted, the body was intact, the splendid form of that great Longobard head clearly outlined; death had not destroyed it, corruption had not invaded his body, as the doctors said. Without the aid of art, some unexplored virtue of nature had preserved him—presumably his having been placed in an iron coffin. The body was so rigid, that without even passing a sheet beneath it, it was lifted and deposited in the magnificent leaden coffin prepared by the municipality.

This was the private ceremony. To day, in the Famedrio of the Monumental Cemetery, the coffin containing the remains of Carlo Cattaneo was deposited in the sarcophagus-marble of Baveno, in the presence of the municipality, representatives of every Italian city, of all the democratic associations, friends from every province, and just the few left of the *vieille garde*. Bertani presented the bronze bust to the municipality of Milan; the Mayor, receiving the bust, made his speech. These speeches I spare your readers. The great fact remains, that in this beautiful Famedrio of the Monumental Cemetery of Milan, as yet, but two great Milanese sleep—Alessandro Manzoni, author of 'I Promessi Sposi,' and Carlo Cattaneo, the *vate* of the United States of Europe and Italy a federal republic.

JESSIE Va. MARIO.

THE LITERARY REMAINS OF MME. DUPIN.

PARIS, March 27, 1884.

COUNT GASTON DE VILLENEUVE has in his possession the portfolio of Mme. Dupin, the friend of Voltaire, of Rousseau, of Montesquieu, of Mably, of the Duc de Richelieu, of so many other illustrious men of the last century. This portfolio, in red morocco, full of letters and of inedited manuscripts, was left to him by his father, who had received it himself from his father, Count René de Villeneuve, grandson by marriage of Mme. Dupin. The portfolio had remained intact for nearly a century, and nothing had come out of it. It does not contain, unfortunately, all the autographs and letters of Mme. Dupin. At the time of the Revolution, the curé of Chenonceaux burned many, fearing that some of the letters might be dangerous for the correspondents of Mme. Dupin.

We find constantly the name of Mme. Dupin in the memoirs of Fontenelle, of Mme. du Deffand, of Duclos, of Rousseau. Her portrait by Nattier (which has been engraved and prefixed to the volume just edited by M. de Villeneuve) explains the extraordinary charm of her person: her features were of a classic purity, at the same time her face had the peculiar delicacy and the winning charm of the beauties of the eighteenth century. She was a daughter of a commissioner-general of the navy at Dunkirk, M. Louis Guillaume de Fontaine. Her mother was on her way from the watering place of Bourbonne-les-Bains, with her eldest daughter, the Marchioness of Barbancois, when the illness of the Marchioness obliged her to stop at Châteauroux, where she received the hospitality of M. Claude Dupin, who was the receiver of taxes. A great friendship was formed during the long illness of Mme. de Barbancois. M. Dupin made a visit to his new friends in Paris, and saw the second daughter of Mme. de Fontaine, who had just left the convent. He was a widower; he was already forty-two years old, and had a son fifteen years old, who became M. Dupin de Francueil, the great friend of Mme. d'Épinay. M. Dupin had just been named receiver-general of finance in the three Bishoprics (Metz, Toul, and Verdun), and in Alsace; he married in 1724 the young Louise, who was only seventeen years old. He was soon afterwards named *fermier-général*, on the recommendation of Samuel Bernard, who was one of the admirers of Mme. de Fontaine, and the putative father of Mme. Dupin.

The *fermiers-généraux* played in the society of the eighteenth century a very important part. Their wealth allowed them to patronize the arts; they admitted literary people into their houses. M. Dupin bought the famous Hôtel Lambert, in the Île Saint-Louis (now inhabited by Prince Czartoryski), and opened his salon to the philosophers, the *beaux-esprits*, the foreigners of distinction. Mme. Dupin, distinguished by her brilliant intellect as well as by her beauty, became one of the queens of fashion. She chose, as a sort of spiritual director and adviser, an old man, the Abbé de Saint-Pierre, famous for his theories on "uni-

versal peace." She had many friends, and she had no lover; surrounded with men and women who almost all had *liaisons*, and who professed no great regard for the conjugal tie, she remained to the end devoted to her husband.

M. Dupin bought, in 1725, from the Duc de Bourbon, the estate and the old château of Chenonceaux. Built on the river Cher, this château, one of the finest of the French Renaissance, had been inhabited by Francis I., by Henri II., by Diane de Poitiers, by Catherine de Médicis. The Dupins lived in great style at Chenonceaux. Young Dupin de Francueil (the son of M. Dupin by his first marriage, who had assumed the name of Francueil, a village of the estate) had a troop of thirty musicians and a theatre. Sometimes the dancers of the opera at Paris came to dance a ballet. The Duc d'Orléans, the son of the Regent; the Duc de Penthièvre (the son of the Comte de Toulouse, who was one of the illegitimate children of Louis XIV. and Mme. de Montespan), paid visits to Chenonceaux. The Choiseuls were among the visitors, during their exile at Chanteloup. M. Dupin also bought the Château de Blanc, near Chenonceaux, of Mme. de Parabère, the friend of the Regent.

Six years after her marriage Mme. Dupin had her first son, Jacques Armand Dupin de Chenonceaux. She made soon afterwards the acquaintance of Rousseau in Paris, and took him for her secretary. Rousseau collected for her the elements of some literary works which she prepared—among others, a vindication of women and of their rights. She soon discovered that she had inspired a passion in the inflammable Rousseau. She dismissed him; but he wrote such humble letters to her and to M. Dupin, and she felt so sure of her own virtue, that she condescended to keep him in her service.

Dupin asked Rousseau to draw up a plan of education for his son, M. de Chenonceaux; this plan is published, with the letters of Rousseau, in the volume which is before us. The document is a curious one. Rousseau begins by making a protest against corporal punishments (which were still used in the eighteenth century with children). He attacks the system of classical education, and objects to the teaching of any religious dogma. The memoir is as full of fallacies and illusions as 'Émile.' The key-note will be found in this phrase: "What is the object of the education of a young man? It is to make him happy." Rousseau established in one of the pavilions of the château a cabinet of natural history and a laboratory of chemistry for his pupil; he soon found that the sciences did not captivate the young man any more than the classics. Armand thought of nothing but pleasure, and when he was twenty his parents thought it well to marry him. Mme. Dupin took the young couple with her to Paris and to the country. Rousseau speaks well of the young Mme de Chenonceaux, and says that it was at her recommendation that he undertook to write the code of education called 'Émile.'

M. de Chenonceaux had not inherited the intellect of his father and mother; he was an adventurous spirit and a gambler. In one single night he lost 700,000 livres, and the Hôtel Lambert was mortgaged in order that this debt should be paid. Mme. Sand, in her 'Histoire de ma Vie,' relates a conversation which she had with her cousin, Count René de Villeneuve. "M. de Chenonceaux, my great uncle," said he to her, "and my grandfather, M. de Francueil, devoured seven or eight millions at that time." After the most extraordinary adventures, after having exhausted every form of human folly, M. de Chenonceaux left for the Île de France, and died there of yellow fever on the 3d of May, 1767.

Mme. Dupin, during all her troubles, found some solace in literature. She showed extreme kindness to Rousseau, and helped him and his family in every circumstance; she was one of the few persons whom he did not abuse. "I only left the Dupins," says he, in his 'Confessions,' "in order to live in liberty. They never ceased to manifest their friendship for me, and I was always sure to be well received by Mme. Dupin." M. Dupin only survived his son Chenonceaux by eighteen months: he died in Paris at the age of eighty-three, in a hôtel of the rue Plâtrière, which he had bought after the sale of the Hôtel Lambert. Mme. Dupin spent her life in Paris in winter, and in summer at Chenonceaux. Her property was still large, and she managed it herself with much ability. When the Revolution broke out, and when almost all her friends fled from France, she buried herself at Chenonceaux with her friend, the handsome Countess of Forcalquier. Her charity was unbounded, and she probably owed her life to the good works which had made her popular in Berri. She lived to the advanced age of ninety-three, and died on the 20th of November, 1799, without the slightest pain, in her great drawing-room at Chenonceaux.

The manuscripts of Mme. Dupin, which are published in the volume edited by M. de Villeneuve, belong to what may be called the school of sensibility. There is not much in them that deserved to be published; not much that remains in the mind of the "Ideas on Happiness." You will recognize the influence of the philosophical school in such maxims as, "Pleasure is the first incentive of human actions." "I would diminish the valuation of reason; it is a great gift of heaven, but I would also give to pleasure what belongs to it; we have it from the same hand as reason, and both are necessary to us." There are some happy and ingenious thoughts mixed up with these commonplace maxims. The same may be said of the "Ideas on Friendship," the manuscript of which is in the hand of Rousseau, who wrote under the dictation of Mme. Dupin, and sometimes was allowed to make corrections and changes. These "Ideas" may be almost considered as the work of collaboration. Rousseau was the worst friend that ever existed; Mme. Dupin was an excellent friend, full of indulgence and kindness. We find also in the volume "Ideas on Education," an essay on the sentiments of the soul, a philosophical letter to a lady friend, a collection of detached maxims.

After these short essays of Mme. Dupin's, which do not rise above the common level of the easy literature of the eighteenth century, the volume contains what remains of her correspondence, with notices of her correspondents, which were, perhaps, useless. It seems rather extraordinary to be served with notices of the Abbé de Saint-Pierre, of Voltaire, of Rousseau, of Montesquieu, of Mably. The editor evidently exaggerates the ignorance of his public. The Abbé de Saint-Pierre was one of the most faithful correspondents of Mme. Dupin. The good Abbé made a portrait of Mme. Dupin, under this title: "Plotina, amiable, estimable, and happy." He modestly compares it to the portrait of Émilie (who was his own mother), by Saint-Évremond. There is not much to say of the "Reflections on some Works of Imagination, in which Imagination has no part," the manuscript of which is also in the hand-writing of Rousseau, nor of the other manuscripts of the Abbé, found in the portfolio of Mme. Dupin. The good Abbé was fond of great schemes, and he was absolutely unpractical. His plans of social reform are mere dreams, and dreams without originality. He was the most amiable of men; he was also the poorest of the philosophers. There are eight letters of Voltaire to Mme. Dupin in the volume of M. de Villeneuve. Voltaire liked her, and admired her *esprit*. He sends to her in a letter the plan of the tragedy of "Alzire," and of a "Discours en vers sur les événements de 1744"; he sends her also a "Panegyric of Saint Louis," a "Poem on Natural Religion," in four cantos, dedicated to the Duchess of Saxe-Gotha, the sister of the good Frederic (these two poems are found in the works of Voltaire). "I am much afraid," says Voltaire in a letter from Potsdam, "that my maladies will soon render me incapable of living near the King of Prussia and near you. I feel that my condition will oblige me to renounce society completely, but I shall always regret your society." There are some letters of Voltaire, written at the time when M. Dupin wrote a criticism of some parts of the 'Esprit des Lois,' of Montesquieu. Voltaire was then in Switzerland, at Ferney. "I have always thought," says he to Mme. Dupin, "that the 'Esprit des Lois' was full of imagination, that there are very amusing parts, that the author is often mistaken, and that Mme. du Deffand was quite right when she said that it was 'de l'esprit sur les lois, et non pas l'esprit des lois.' Still, with all its defects, the book will always be dear to our nation. It speaks perpetually against three things which the public does not like much: despotism, priests, and taxes."

The latter part of the volume consists of letters from Rousseau and unpublished manuscripts of the famous philosopher, with letters of Montesquieu, Mably, Mairan, the Comte de Tressan, Mme. de Tencin, the Abbé d'Olivet, Mme. de Mirepoix, the Duc de Richelieu, Ruthière, the Comte d'Argenson. This collection, on the whole, deserves to find its place in the library of all the amateurs of the literature of the eighteenth century.

Correspondence.

A PLANK FOR THE CHICAGO PLATFORM.

To the Editor of The Nation:

Sir: It is plain to every thinking man that the Republican party, if it hopes to win, must leave no room for doubt as to its entire loyalty to the principles of civil-service reform. Would it not then be well for Republican clubs, associations, and conventions throughout the country to follow the example of the Young Men's Republican Club of Baltimore, in resolving that the delegates to Chicago ought to be instructed to do all they can to have a plank put in the national platform endorsing the action of a Republican Congress in passing, and a Republican administration in enforcing, the Civil-Service Reform Act; and pledging the party to extend the principles of that measure to all branches of the Federal, State, and municipal governments?

R.

Baltimore, April 10, 1884.

A COINCIDENCE THAT HAS A CAUSE.

To the Editor of The Nation:

Sir: In your pleasant reference to my pamphlet upon "The Glacial Boundary in Ohio, Indiana, and Kentucky," humorously suggesting a coincidence between the present centre of population of the United States and the glaciated area of Kentucky, your readers may be led to infer that the coincidence in Ohio between the glacial boundary and the southern line of wheat production is of a like capricious or accidental character; whereas, the uniform productiveness of the glaciated area in Ohio is a direct result of the glaciation to which it has been sub-

jected, and so the coincidence comes to be an important confirmation of the accuracy of the limits assigned by me to the operation of the supposed cause. The relation of the glacial period to the formation of our fertile prairies is as yet but partially appreciated. The forthcoming report of Professor Chamberlin will doubtless shed much light on the subject.

Yours truly, G. FREDERICK WRIGHT.

OBERLIN, O., April 11, 1884.

EXCESSIVE LEGISLATION.

TO THE EDITOR OF THE NATION:

SIR: I have been waiting with patience for "G. B.'s" deliverance upon the discussion concerning over-legislation going on in your columns. It appears to me that he is losing an admirable chance to apply his pet theory of "responsible government." But as he does not see fit to avail himself of the opportunity, I make bold to do it for him. Perhaps, as a Canadian, living under "responsible government," both in Dominion and in Provincial matters, I am more alive to its advantages than any outsider can be. (Possibly, I may say in passing, "G. B." might find some advantage in examining the working of his favorite method of government with us as not only much nearer him, but socially far more resembling his own country than England does).

It seems very clear to me that your glut of legislation, and its too frequent poorness in quality, result directly from the facts that your legislators have nothing else to do but to legislate, and that there is no one, or no body, chargeable with a general responsibility for the legislation of the session. Your Assemblies and Congress meet almost solely to make laws and grant money; our Parliament and Provincial Assemblies really come together, as much as for any other purpose, to overhaul the conduct of the Government for the past year, and to shape their policy for the coming one. Our legislator does not need to father some popular bill to make a name and please his constituents. If he makes two or three good speeches for or against the Government' and votes right on all party divisions, he has done all that is expected of him. All really heavy bills are taken charge of by the Government. They put them in proper shape and see to their passage through the House. Bagehot has pointed out that what he terms the "elective" function of an English member of Parliament is much more important than his legislative one. He says:

> "At the end of half the sessions of Parliament, you will read in the newspapers and you will even hear from those who have looked close at the matter, and should know better, 'Parliament has done nothing this session. Some things were promised in the Queen's speech, but they were only little things; and most of them have not passed.' Lord Lyndhurst used for years to recount the small outcomings of legislative achievement; and yet those were the days of the first Whig Government, who had more to do in legislation, and did more, than any other government. The true answer to such harangues as Lord Lyndhurst's by a minister should have been in the first person. He should have said firmly, 'Parliament has maintained Me, and that was its greatest duty. Parliament has carried on what, in the language of traditional respect, we call the Queen's Government; it has maintained what, wisely or unwisely, it deemed the best executive of the English nation.'"

The difference in the two systems is emphasized in the manner in which the two legislatures are regarded by the people at large. If I can judge from what I see in your papers, the assembling of Congress is looked upon with dread and anxiety. There is no telling what mischief it may be at. Your State Assemblies have grown to be a nuisance only to be tolerated once in two years. With us it is not so. The meeting of our legislative bodies is looked forward to with eagerness. The Government has been doing a variety of things since the last session. It is believed to have several important matters to ask a Parliamentary sanction for. Its opponents are eager to get it before the House, to move for papers to attack it. Its friends are anxious to see what defence is to be made of what has been done, and what new moves are to be made. Biennial sessions would not be dreamed of with us. Consequently our Parliamentary sessions are animated and interesting, and yet our statute-book shows but comparatively little legislation. BLUENOSE.

HALIFAX, April 7, 1884.

DIVORCES IN THE STATE OF THE MARRIAGE.

TO THE EDITOR OF THE NATION:

SIR: In speaking of the bill reported by the Judiciary Committee of the Senate for the collection of statistics relating to marriage and divorce, you say: "In nine cases out of ten, when the time for divorce comes, it is not the State of the marriage to which application is made, but some other State." Something like this opinion is very common, though perhaps few venture to put the ratio so high as "in nine cases out of ten."

A great deal of inquiry has led me for a long time to think that, except perhaps in the extreme West, the number of divorces granted to persons who are not in good faith residents of the State where they seek divorce, is much exaggerated. A judge of Detroit has caused a careful analysis to be made of the divorces granted in Wayne County, Michigan, for the last six months of 1883. Of the 130 couples divorced in that period, 48 were married in the city of Detroit, and 36 others in Michigan. In this instance, then, 84 couples, or 65 per cent., were married in the State where they obtained their divorce. According to the last census, about one-half of the population of the county were born in the State. I also find that 10 of these 130 were married in New York, 9 in Canada, 8 in Ohio, 4 in England, 5 in Germany, 1 in Ireland, and 1 "unknown," and these numbers correspond pretty well with the percentage of inhabitants born in these several countries. When we remember that Canadians are said to come into the States both for marriage and divorce, and that Detroit is especially well situated to invite them for these purposes, these figures are surprising. They are the only statistics I recall in which the place of the marriage is given—a very important fact, and one easily obtained from the libels for divorce, but for the want of which we are liable to great error both of opinion and of action based on assumptions which may turn out to be largely wrong. Of course, this is but one county, and may be exceptional, though I see no reason why it should make an unfair showing in respect to the point in question.

The evils from conflicting divorce laws are grave enough, but I find, on closely questioning those best informed, that in counties where there are no great cities, most of the parties seeking divorces are known to be residents in good faith. For obvious reasons, the evils are greater and more apparent in the larger cities. But these contain less than one-fourth the population. It is a matter of congratulation to all friends of social order that Congress is likely to give us the facts on this important subject in place of the guesses we have all had to make.

Your remark about the mischief due to the enormous number of courts authorized to grant divorces seems to deserve more consideration than has been given to the point.—Yours,

SAMUEL W. DIKE.

ROYALTON, VT., April 10, 1884.

ALIEN SUFFRAGE AND THE FOURTEENTH AMENDMENT.

TO THE EDITOR OF THE NATION:

SIR: In point of distance traversed and numbers involved, the peaceful Wandering of the Nations to-day is more remarkable than the bloody Wandering of fifteen centuries ago; moreover, its political significance promises to be little less.

Our country bows meekly beneath the scourge of excessive immigration, and instead of repealing the laws that invite foreigners to a share in our Government, we have gradually granted them more and greater privileges, until we have actually come to the pass of giving the right of suffrage in thirteen States to aliens who have simply "legally declared their intention to become citizens of the United States." This right is given in each of these States by the State Constitution. Their names and other data are given in the following table:

When admitted to the Union.	Names of States permitting aliens to vote.	How long before voting alien must have resided in U. S.	How long before voting alien must have resided in State.	How long before voting alien must have made "declaration of intention."
1819	Alabama..	.....	One year.	.....
1836	Arkansas..	.....	" "	.....
1876	Colorado..	.....	Six months.	Four months
1845	Florida....	.....	One year.	.....
	Georgia....	.....	Six months.	.....
1861	Kansas....	.....	" "	.....
1837	Michigan..	.....	Two years and six months.	.....
1858	Minnesota.	One year.	Four months.	.....
1821	Missouri.	.....	One year.	Not less than one year or more than five years.
1867	Nebraska..	.....	Six months.	Thirty days.
1859	Oregon....	One year.	" "	One year.
1845	Texas.....	.....	One year.	.....
1848	Wisconsin	.....	" "	.....

On examining this table, we find that one of the original thirteen States and twelve out of the seventeen States admitted to the Union since 1819 permit unnaturalized foreigners to vote; that it is possible for them to cast a ballot in four States six months after arrival, in eight States one year after arrival, and in one State two years and six months after arrival; and that Missouri alone of them all qualifies this permission by any reference to ultimate naturalization.

When we consider further that Florida and Georgia adopted their present Constitutions determining the right of suffrage in 1868, Arkansas hers in 1874, Alabama, Missouri, and Nebraska theirs in 1875, Colorado and Texas theirs in 1876, and that the dates of the constitutional amendments determining the rights of suffrage in Minnesota and Michigan are respectively 1868 and 1870—when we consider these facts, and see how recently the whole question has been laid before the people in the ten States above mentioned, then first do we begin to comprehend the strength of alien influence among us to-day.

Some of these States have gone a step further in their concessions to unnaturalized foreigners. They are eligible to either branch of the State Legislature in Alabama, Florida, Kansas, Minnesota, Nebraska, and Wisconsin, and even to the office of Governor in Kansas.

Romulus himself did not hold out so many inducements to immigration as Kansas does, for, while he opened his gates to everybody, "and no questions asked," he at least kept the governorship in his own hands.

Naturalized foreigners can vote in all the States immediately, or almost immediately, after receiving their naturalization papers. They are likewise eligible to all State offices.

These privileges are conferred by the Constitutions of thirty-six States and by statute in two, viz.: New Hampshire and Vermont.

Massachusetts for a brief period interposed an interval of two years between naturalization and the ballot-box, but that was twenty years ago.

The second section of the Fourteenth Amendment to the Constitution of the United States is interesting in this connection. It reads as follows:

"But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the Executive and Judicial officers of a State, or the members of the Legislature thereof, is denied *to any of the male inhabitants of such State being twenty-one years of age and citizens of the United States*, or in any way abridged except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State."

It is universally admitted that this section does not prevent the State's making the payment of poll taxes and other taxes a condition precedent to the right of suffrage, or limiting the suffrage by educational and property qualifications, and no less universally admitted that it does prevent their withholding the ballot from a foreigner after naturalization, provided he complies with all the conditions prescribed to native voters. It were well worth while to determine whether the interpretation of the Fourteenth Amendment in this latter particular is correct, and it is unfortunate that of all the thirty-eight States only New Hampshire and Vermont can do so by simple act of legislature. Nothing of the sort, however, can be expected of New Hampshire, where the two parties are evenly matched and wary of new issues; but the Republicans command such an immense majority in Vermont that, were they so disposed, they might easily pass a suffrage law discriminating against naturalized foreigners. This done the matter would probably sooner or later reach the Supreme Court.

It is vain to attempt to establish the old order of things by substituting in the Fourteenth Amendment the phrase *native citizens of the United States* for "citizens of the United States," because the thirteen States favoring alien suffrage would undoubtedly oppose such substitution, and it would thus be impossible to obtain the concurrence of two-thirds of the States requisite for amending the Constitution. They would as successfully and more vehemently oppose a Sixteenth Amendment excluding unnaturalized foreigners from the polls, yet such an amendment it behooves us to have if the United States can dictate to the States at all in the premises. E. E.

CAMBRIDGE, MASS., April 10, 1884.

WALTER SCOTT'S PRESBYTERIANISM.

TO THE EDITOR OF THE NATION:

SIR: *Macmillan's Magazine* for March, 1884, has a very entertaining review, by Sir Francis Doyle, of Mr. Robert Ormsby's recently published memoirs of the eminent English lawyer, Mr. James Hope-Scott, of Abbotsford. In discussing Mr. Hope Scott's union with the Roman Catholic Church the reviewer remarks:

"I cannot help smiling when I think how that gallant *old Presbyterian*, Sir Walter Scott, had he been suddenly called back, would have stared and grumbled to find himself surrounded in his beloved Protestant castle by a swarm of black gowns and tonsured heads."

It seems strange that a writer as familiar with literary history as the author of this review must be should have fallen into the error of supposing Sir Walter Scott to have been a Presbyterian. Apart from any direct statement, the indirect evidence of his attachment to the Scottish Episcopal Church, which is in agreement in doctrine and polity with the Church of England, is very strong. Thus, after Sir Walter's return to Abbotsford during his last illness, Lockhart says that on a Sunday evening "he heard the church service, and when I was about to close the book said: 'Why do you omit the visitation of the sick?' which I added accordingly." And at his funeral at Dryburgh Abbey, his biographer says further, that "Mr. Archdeacon Williams read the burial service of the Church of England." But in addition to this indirect evidence, it is expressly stated by Lockhart that Sir Walter "took up early in life a repugnance to the mode in which public worship is conducted in the Scottish establishment, and *adhered to the sister church*, whose system of government and discipline he believed to be the fairest copy of the primitive polity, and whose litanies and collects he reverenced as having been transmitted to us from the age immediately succeeding that of the Apostles." And so it is quite apparent that though, in consequence of having been born of Presbyterian parents, Sir Walter was once a young Presbyterian, yet he certainly never was an "*old* Presbyterian." S. C. CHEW.

BALTIMORE, April 8, 1884.

"DIE ENTFÜHRUNG AUS DEM SERAIL."

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of March 6 the reviewer of Dr. Gehring's life of Mozart says: "Very curious are the opinions passed on an earlier opera, 'Die Entführung aus dem Serail,' which has now almost completely disappeared from the stage, as its music appears too 'thin' for modern taste. In 1782 it was judged differently." And he then quotes the well-known anecdote of the Emperor Joseph finding too many notes in the opera, and Mozart replying, "Exactly as many notes as are necessary, your Majesty." (This anecdote, by the way, is also told of Napoleon and Cherubini, the music in question being written in commemoration of the death of General Hoche.)

The statement made by your reviewer that "'Die Entführung' has now almost completely disappeared from the stage" is very far from the truth, so far as the German theatres are concerned. It is given in Vienna with Frau Wilt as *Constanze:* the second *bravour-arie* has been cut out, and an aria from "Così fan tutte" has been given to *Belmonte;* between the first and second acts the "Rondo alla Turca" in A moll is played, the instrumentation being by Herbeck.

In Leipsic the opera is still given, and here in Berlin this winter it has been sung several times with Lilli Lehmann as the heroine; and the Berlin critics, instead of finding the music "thin," rejoice in its freshness and exquisite grace. I have no doubt but that it is to be seen and heard in other German cities, but I cannot personally bear witness. Three or four years ago it was sung in London, Sembrich taking the part of *Constanze.* Surely this is not an "almost complete disappearance from the stage."

Your reviewer—perhaps without intention—gives his reader to understand that "Die Entführung" was not a success in a popular or artistic sense even in 1782. Saying that it was "judged differently" then—*i. e.*, that it was not considered "thin"—he quotes two slurs of the Emperor Joseph. Now this opera, given for the first time the 12th of July, in two days brought in 1,200 florins to the treasury. It was difficult to get a seat in the theatre at the representations. In October it was given for the benefit of the Grossfürst, and Mozart, as he wrote his father in that month, sat at the clavier and directed, "finding it good to do so, partly because I can then wake up the orchestra when they nod a little, and partly because I can show myself as the father of my child to the nobility present." Before this, in August, at Gluck's wish, it was performed expressly for his enjoyment, and the old master gave Mozart many compliments and invited him to dinner. The opera not only gave Mozart a sure footing in Vienna, but it spread his fame throughout Germany, and Prague, Leipsic, Hamburg, and Berlin were as enthusiastic as Vienna. Goethe, in his correspondence with Zelter (ii., 121), tells of his own attempt to furnish a libretto for his friend Christoph Kayser to set to music, and, after speaking of the faults of their "Singspiel," called "Scherz, List, und Rache," adds that all their efforts went for naught as soon as Mozart appeared upon the scene. "'Die Entführung,'" he writes, "knocked everything to the ground, and there was never afterward at the theatre any talk of our so carefully prepared composition."

Jahn, in his 'Mozart' (vol. iii., pp. 79–128, ed. 1858), shows at length the importance of the "Entführung" in the history of the growth of German opera, and in the appendix to the same volume are to be found specimens of contemporaneous criticism, interesting in the extreme. It is a pity that the new English translation of Jahn's invaluable work is a translation of the much-abbreviated second edition—a work perhaps more popular than the first, but of much less value to the musician.

Your reviewer seems to have some respect for Weber as an opera composer, and it may interest him to know that this same Karl Maria Weber, in a letter written in 1818, speaks of "Die Entführung" as "glowing with the wanton fire of youth—a creation very dear to me." "I believe," says Weber, "that in this opera Mozart's artistic skill had reached its maturity, and afterward he only advanced in world-knowledge. The world had a right to expect more 'Don Juans' and 'Figaros' from him; but, with the best of intentions, Mozart could not have written another 'Entführung.'"—Respectfully, PHILIP HALE.

BERLIN, March 24, 1884.

[The statement that "Die Entführung" has "almost completely disappeared from the stage" was based on the fact that the present writer, during a residence of more than four years (since 1876) in Munich, Berlin, Vienna, and other German cities, had not a single opportunity to hear this opera. Our correspondent's evidence does not disprove our qualified remark. The Germans seldom allow works that were once popular to remain entirely neglected, but revive them at intervals for their historic interest, this being one of the useful functions of a state-supported opera-house. In Vienna "Die Entführung" was revived in 1880, together with several other operas, in the "Mozart cyclus." Neither here nor elsewhere has it remained a regular "Répertoire Oper," like "Don Juan," "Figaro," "Faust," "Lohengrin," etc. The 'Allgemeiner Deutscher Musiker-Kalender' for 1884 gives a complete list of the operas performed in Berlin during the season 1882-3, in which "Figaro," "Don Juan," "Schauspieldirector," "Magic Flute," and "Titus" are mentioned with 7, 5, 3, 3, and 3 performances respectively. "Die Entführung" was not given at all. The question as to whether the music is "too thin" is a matter of taste and opinion. The Berlin critics may "rejoice in its freshness," but the Berlin critics have always been half a century behind the age, owing to the

fact that their operatic managers have from time immemorial always waited before accepting a new opera until all the other Germans knew it by heart, and even then they have not accorded it, in recent cases, anything more than a slovenly performance.—Ed. Nation.]

CLASSICAL EDUCATION.

To the Editor of The Nation:

Sir: Perhaps you will excuse my troubling you with a few words about classical education, when you learn that I (in common, apparently, with all other contributors) think that most that has been said on the subject has been very inadequate. Various writers take one side or the other, each for reasons of his own; but I have as yet seen no attempt to reconcile the claims offered by scientific and by classical training.

This reconciliation can be best found, I think, in a historic examination of education. Abstract arguments, like those of "Teacher of German" in your issue of April 3, may weigh on one side or the other; but the true value of all systems is shown conclusively only by the experience of mankind, which s eadily leads to the survival of the fittest in education as in everything else. Most persons will agree to this in the abstract; but the mistake yet commonly made, especially by the "votaries of the college fetish," is to suppose that what has survived till now will continue unchanged. But if this question were put to the "votaries": "Do you expect that in a million years or so from now, the millions of young then being educated will be still engaged on Greek and Latin?" I fancy most of them would be somewhat startled and not inclined to answer in the affirmative immediately. Nevertheless, they constantly put themselves out of the line of historical advance by contending either that there should be no change, or that any change made should be toward increased study of the classics. The fundamental truth that education is relative only, is constantly overlooked by the champions both of science and the classics.

The fact is that the classics have been constantly taking a lower place in the past, and it is plain that this tendency will continue in the future, for the reason that their value, great as it is, must grow less and less conspicuous among the achievements of the world. An acknowledgment of this undeniable fact does not lead us, as many of the scientific champions imagine, to the conclusion that the study of the classics should be summarily discarded. It rather leads us to think that they should still have a large place in the study of the scholar and in the education of the young.

To most readers will probably occur the further inquiry, Does this mean that a study of the classics should form a part, more or less conspicuous, in each college man's education, or only in the collective culture of the whole? There will be disagreement on this point; most of those who have witnessed only the ordinary system will probably take the former alternative. But it seems clear to your present correspondent that the inevitable tendency is toward increased divergence of individual pursuits. In the language of the great philosopher of Evolution, the tendency is "from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity." (A study of the first expression in its present application will repay classical "votaries".) A more tangible statement of it to those who, with Mr. Matthew Arnold, have an extremely "indefinite" conception of this irresistible law, is this: increasing specialization of employment must necessarily lead to divergence of preparation. And perhaps those to whom this also is not convincing will perhaps see something in the analogy of education to commerce, in which *the highest good results from free competition*—a principle that will be as valuable in education as in the government of trade; arbitrarily prescribed courses of study being strictly analogous to "protection." Of course men like Mr. Arnold (who settles the Evolutionists by a quotation from Homer) will see nothing in this. But to some, as to me, the considerations hinted at appear decisive; and they are accordingly led to the conclusion that the classics should be elective, and in this is found the only possible reconciliation between these opposing claims. With freedom of choice the demands of society for each kind of culture will be met with the desired supply. In this university every one can testify to the excellent results of changes made in the way indicated.

A further inquiry may be suggested, though its scope is too great for discussion here. How soon in education will this divergence appear—college, high school, or primary? And to how many branches of study will it extend? It seems to me that this is a problem that merits great attention. My own opinion is that the adaptation to individual choice will gradually extend until it reaches the very beginning and embraces all subjects. That, however, will certainly take a long time.—Yours respectfully,

A.

University of Michigan, Ann Arbor, April 7, 1884.

Notes.

Jansen, McClurg & Co., Chicago, have nearly ready Nohl's 'Life of Liszt,' translated by G. P. Upton, with a portrait; and Topelius's historical romance, 'Times of Linnæus,' in the "Surgeon's Stories" series.

The Delegates of the Clarendon Press propose to issue a series of Old Latin Biblical texts from manuscripts which are unpublished or have been inadequately edited, all under the general superintendence of Professor John Wordsworth, of Brasenose College. The first of the series, edited by Professor Wordsworth, gives the Gospel of Matthew according to the St. Germain MS., numbered Lat. 11,553, in the National Library at Paris, and marked *g* by Tischendorf. The editor is of opinion, from collation with other MSS., that the text is Old Latin, with corrections after the Vulgate. It offers a good deal that is interesting in its readings, its orthography, and its punctuation, and the satisfactory way in which the editorial work is done puts its material clearly before the student. The introduction and appendices give the history and characteristics of the MS., with valuable explanatory remarks. It was highly esteemed by Bentley, and collated by his coadjutor John Walker, and will be welcomed in this complete form by students of the New Testament text.

We have received the third volume of Schaff's 'Religious Encyclopædia, or Dictionary of Biblical, Historical, Doctrinal, and Practical Theology, based on the *Real-Encyklopädie* of Herzog, Plitt, and Hauck' (Funk & Wagnalls), already reviewed in these columns. This volume completes the work, in advance of the revised edition of the German original, which has not yet reached the letter S. The American editor has had the benefit of several advanced sheets of that letter, but for the remaining titles he has had to use the last seven volumes of the first German edition. Half of the third English volume, however, is made up of original matter. A new and greatly enlarged list of contributors is attached, as well as a number of neatly-executed maps of Bible lands, and a list of "Errata and Addenda to the First and Second Volumes," which, we are pleased to see, has scrupulously profited by the critical remarks of our review.

Few theological critical writers enjoy a higher reputation for comprehensive and sound scholarship than Prof. Edward Reuss, of the University of Strassburg; yet, so far as we know, the first English rendering of any of his works, in French or German, is David Hunter's translation from the second French edition of his 'History of the Canon of the Holy Scriptures in the Christian Church' (E. P. Dutton). It will make the name of the veteran author more widely known among English and American friends of Biblical inquiry, and awaken a desire for an acquaintance with his larger publications, among which his voluminous Bible work ('La Bible: traduction nouvelle avec introduction et commentaire') occupies the foremost place. This highly valuable publication is as yet unfinished, while the author is just completing the eightieth year of his active life.

From Milwaukee we have received an English "school and family edition," in neat print and binding, of 'The Pentateuch,' published by Adolph Moses and Isaac S. Moses. It is evidently destined for use in Hebrew schools. It is, judging from a hasty comparison, a reproduction of the Authorized Version, with the exception of the poetical pieces, the rendering of which follows more recent translations by Jewish writers.

Mr. Christern has received the prospectus of a new Dictionary of Greek and Roman Antiquities, just beginning to be published by R. Oldenbourg, Munich and Leipzig. Its full title is 'Denkmäler des klassischen Altertums zur Erläuterung des Lebens der Griechen und Römer in Religion, Kunst und Sitte.' It will appear in three volumes, under the editorship of A. Baumeister. The illustrations will be the special feature, and will be both numerous and fresh, the engraving being largely by a "process" of uncommon excellence and fidelity. Some 200 will be full page, some 700 will occupy half a page, and 500 will be scattered through the text.

From the same source we derive a catalogue (Part I.) of the library of the late Dr. J. Court, to be sold in Paris in the rue Drouot on May 8–10. Its richness in works relating to America (early voyages and histories) makes it well worth the attention of collectors.

Messrs. E. & G. Goldsmid, 12 Castle Street, Edinburgh, propose to republish Hakluyt's collection of voyages in a handy edition, the first since the limited reprint of 1809–12. They will include "every additional 'Curious, Rare, and Early Voyage and Discovery' translated or published by Hakluyt, or at his suggestion," with other desirable matter from the stores of the Hakluyt Society. Mr. Edmund Goldsmid will edit the series, which it is hoped to complete in five years and fourteen to fifteen volumes, at two to five shillings a part (according to quality).

Mr. Winfred A. Stearns, Amherst, Mass., will, if the requisite support be forthcoming, undertake the publication of a scientific journal under the auspices of the Massachusetts Agricultural College. It will be called the *Bulletin of the Natural History of the State of Massachusetts*, and will be exclusively devoted to the subject designated in the title.

With the July number the *Newport Historical Magazine* will be converted into the quarterly *Rhode Island Historical Magazine*, with its old scheme retained and enlarged. Its proprietors are the Newport Historical Publishing Company.

Le Français, published monthly at Roxbury, Mass., by M. Jules Lévy, is by all odds the best educational French journal ever attempted in

this country. It is now in its fourth year, but its support still seems to be inadequate. We cannot too strongly recommend it as an adjunct wherever French is taught. Not less than one copy should be taken in every school having classes in the language. *Le Français* will not only assist in mastering idioms and pronunciation, but, thanks to the editor's cultivated sense for selection, in forming the taste of the learner.

The *Publishers' Weekly* for April 5 is entirely a memorial number, embodying a sketch of the life of the late Frederick Leypoldt, the proceedings of the trade meeting in this city to take notice of his decease, his prefaces to his chief undertakings, the words of praise and regret from many quarters, and a list of his publications. Add, besides, a steel portrait, not quite subtle enough to express the finer traits of Mr. Leypoldt's physiognomy, and a tribute to the late Nicholas Trübner, whose death occurred almost simultaneously with that of the American bibliographer. In the *Weekly* for April 12, Mr. R. R. Bowker announces that he will assume the direction of this publication, keeping the same excellent staff, and retaining the services of Mrs. Leypoldt. This is equivalent to saying that the *Weekly* will maintain its high character for accuracy and independent usefulness. The supplement to the 'American Catalogue,' it is stated, will soon be pushed forward to completion.

The April number of *Longmans' Magazine* contains an account of the Macready riot in Astor Place, by an eye-witness, Mr. W. C. Miller. It is written with greater fairness and fuller knowledge than any which has hitherto appeared in print in England. It notes without irritation the double part played by "Ned Buntline," and it sets forth succinctly the success of the Seventh Regiment in clearing the streets.

Mr. Andrew Lang, whose 'Ballades and Verses Vain' are soon to be published here by Charles Scribner's Sons, has accepted the editorship of the English edition of *Harper's Magazine*, as *Harper's Weekly* informs us.

Among the new periodicals which have come to our table is *Wowapi*, "a magazine devoted to the cause of the Indians." It is, of course, published in Boston, the hereditary seat of pity for the aborigines. The typographical appearance is open and agreeable, but we find the contents somewhat too miscellaneous, and it is not clear just what audience is aimed at. It may be had of W. B. Clarke & Carruth, 340 Washington Street, Boston. Quite different in scope is No. 1 of the *Glasgow University Review* (Glasgow: Wilson & McCormick), which is not greatly above the level of college magazines in this country. It has for a frontispiece an etching of the Old College gateway.

The two volumes of "Stories by American Authors," which begin the series of the Messrs. Scribner, have a taking exterior, their bright chrome cloth covers setting off well the black imprint. The press-work is not quite up to what we might expect. The size is well adapted for the coat pocket or satchel.

A modest memorial of Newton Francis Whiting, late financial editor of the *Evening Post*, and for many years a financial contributor to the *Nation*, has been privately printed. It contains an excellent photographic likeness of Mr. Whiting.

Parts 101–105 of the new 'Brockhaus' Conversations-Lexikon' (New York: L. W. Schmidt), which close the seventh volume of this valuable work, are singularly barren of important biographical articles. In other respects they are above rather than below the average. Among the more significant articles is one on Secret Remedies (*Geheimmittel*, arcana), with a curious list of these, the price and the "worth" being added as in the case of the fertilizers reported on by our agricultural experiment stations. The series of articles relating to the Brain is extensive, and what is noticeable here—so different from what must have been the treatment fifty years ago—is that no mention is made of phrenology in describing the localization of cerebral functions, nor is any work on the brain earlier than 1857 cited. The Ear is another topic fully treated and illustrated. Under Learned Societies are given lists, useful if not exhaustive, for all the civilized world; and again under Geographical Societies. Projectiles and Ordnance have a good allowance of text and woodcuts, and another valuable list is that of general-staff maps for all nations. This warlike proficiency, by the way, would have led us to expect a more accurate account of the battle of Gettysburg than is given here. We must further mention an interesting article on the German National Museum, and two on Geneva and Genoa, both accompanied by plans. Excellent colored maps of Northeastern France and of Frankfort and its environs are superadded. The volume ends with the letter G, Trade Organizations being last among the longer articles.

It looks as if another instalment (the 22d) would complete the lingering task of Mr. J. ten Doornkaat Koolman, so conscientiously pursued for years, in the making of his 'Wörterbuch der Ostfriesischen Sprache' (Norden: H. Braams). The two latest numbers carry the dictionary along to the affix *-wards*, identical with our English affix, as are so many of the words which we here encounter—*stoker, stop! stôrk, störm, strand, tide, twîg, tip, top, top-mast, up*, etc. Other forms are but slightly disguised, as, *stofe* (stove), *stôpe* and *stâp* (stoop, of a house), *stôl* (stool); *stuttern, trampeln, twisten, upholden; tîr-liren* (tirra-lirra), etc. Here occurs also the familiar childish game of *tik-tak-tuk*, in which the "tick" refers to the checking or pointing off of the squares. Under *swart* we recognize the familiar proverb of pot calling the kettle black, in "de pot wil de ketel 't ferwiten, dat hê swart is."

"Flip" and three other of Mr. Bret Harte's stories have just been published in a one-volume French translation by Calmann-Lévy, Paris.

The latest works by American authors which have been added to the Tauchnitz Series are a two-volume selection of Poe's tales and poems, with yet another biographical sketch by the irrepressible Mr. John H. Ingram; Miss Howard's 'Guenn,' and Mr. James's 'Siege of London.' Among the forthcoming volumes are Mr. James's 'Portraits of Places,' Mr. Howells's 'Dr. Breen's Practice' and 'A Woman's Reason,' Mr. Crawford's 'Roman Singer,' Dr. Holmes's 'Poet at the Breakfast Table,' and a new volume of Mr. Bret Harte's.

From J. H. Bufford's Sons we receive two large and well-executed lithographic portraits, one of Mr. Seth Low, Mayor of Brooklyn, an excellent likeness, if a little younger in appearance than his Honor appears to-day, and the other of the late Wendell Phillips, which is rather a popular portrait than a subtle one. The likeness is unmistakable, but not such as will commend itself to those who knew Mr. Phillips intimately.

We receive from C. Klackner, of 17 East Seventeenth Street, New York, an excellent large etching, by Mr. S. T. Ferris, of the late George Fuller's "Nydia," rendering admirably such qualities of Mr. Fuller's art as can be put into white and black; but as this painter's powers were eminently those of the colorist, it is impossible for any etching of one of his works to convey a satisfactory idea of it. The essay on the genius of Mr. Fuller, which accompanies the etching, is absurd, and mistakes alike the quality of Fuller's genius and the function of the arts of painting and etching. The best thing that can be said of Mr. Ferris's work is that he has given the quality and spirit of the painter's work in sincerity and with eminent skill. The *remarque* proofs are marked by a portrait of Mr. Fuller, etched in the margin of the plate.

We have also from the same publisher an original wood engraving by Elbridge Kingsley, of exceptional size (12x17) and very remarkable quality. It does not appear, however, that there is any gain in technical excellence to be obtained by this "original" cutting of the block. Nature-study and art-study both gain by being separated where practicable, in the final record, and Mr. Kingsley's power as a designer does not appear from his wood engravings as of the first order by any means, while his engraving cannot of course, as a whole, be better than his drawing. The higher qualities of design are not to be got before nature, and therefore the engraving, which is only a translation of the design, must suffer with it from a practice which is not founded on the requirements of art.

Hans Ellissen, bookseller in Leipsic, has issued a circular to German booksellers on the need of subject indexes to their trade catalogues, and enclosing a specimen of his own. Such indexes, he thinks, would cover a million titles, and be very useful. The *Neuer Anzeiger* thinks that the booksellers will not coöperate, and that he might, with as much chance of success, undertake an index of universal literature.

The desperate activity of the Bonapartist press in France is well illustrated by an amusing blunder recently committed by the *Pays*. An attempt is made to show that Paris is fallen from the high condition of splendor that formerly characterized that city, into a mere abode of mud, bankruptcy, and licentiousness. In support of this position, Mr. George R. Sims, "one of the most eminent writers in London," is quoted as saying that "Ichabod may be read on everything Parisian." The editor of the *Pays*, apparently never having heard of "Ichabod," seems to suppose that the eminent writer in London meant to use the word 'Ichaboe,' and proceeds to append the explanation that 'Ichaboe' is an island off the coast of Africa, famous for its guano. It might be held that the force of the figure is not weakened by change.

Professor Newcomb, who went out to observe the transit of Venus at Cape Town, South Africa, in 1882, remained abroad during the spring and summer of the following year, in pursuance of orders from the Navy Department, to collect notes on recent improvements in astronomical observatories, instruments, and methods of observation at the principal observatories of Europe. His report on this duty has lately been published as a Senate document, and contains detailed information of invaluable importance to persons who may intend to found new observatories, or to design or purchase new astronomical instruments. The establishments visited by Professor Newcomb, and from which his information was gathered, were the observatories of Paris, Neuchâtel, Geneva, Vienna, Berlin, Potsdam, Leyden, and Strassburg, and the workshops of the Messrs. Repsold at Hamburg. The great Vienna telescope, lately completed for the Imperial Observatory at that place by Mr. Howard Grubb, of Dublin, is the largest refracting telescope in actual use at the present time, its object-glass having an aperture of twenty-seven inches, or one inch more than the Clark telescope at the Naval Observatory, Washington. Professor Newcomb's report on the former instrument is principally in the nature of a comparison of its working with that of the latter. As a piece of mechanical engineering the Vienna telescope reflects great credit on its designer and constructor, but the

contrivances for the convenient manipulation and use of the instrument are in some regards defective. The figure of its object-glass Professor Newcomb pronounces perfect, in so far as he could judge from the character of the images formed by it. Its color-correction is less than in the Washington telescope.

—A correspondent at West Point advises us of an obvious slip in our recent review of Mr. Lowell's 'Hessians,' when we stated that only West Pointers could be officers in our army. This was said by way of extenuating the German practice a hundred years ago; and what we had in mind was the well-known inconvenience and difficulty which are experienced among us in promotion from the ranks, when the material from which we recruit is so inferior to that which is graduated from West Point.

—The annual systematic view of the German book-selling trade, presented by the *Börsenblatt*, affords not only interesting evidence of the great literary activity of the German people, but also a valuable means of comparing the number of their literary productions with the number of similar productions in other countries. The total number of works published in 1883 was 14,802, as against 14,774 in 1882. This increase of only twenty-eight appears in striking contrast with the increase of 754 in England, to which attention was called in No. 972 of the *Nation*. But although the difference between one year and another in the German book trade is not so marked as in some other countries, it is only necessary to observe the great number of valuable books issued to be convinced that Germany is still entitled to be regarded as in a very emphatic sense the nation of book-makers. While the number of German works issued was no less than 14,802, the total number issued in Great Britain was only 6,145, and the number in the United States only 3,481. The difference appears not less significant when we carry the comparison into details. For example, in theology, Germany published 1,504 books; Great Britain, 704; the United States, 375. In the domain of history, Germany produced 795; Great Britain, 414; the United States, 119. In medicine and hygiene, the number published in Germany was 922; the number in Great Britain, 163; the number in the United States, 211. But the greatest contrasts are in the number of works on the various departments of education and belles-lettres. The total number of books classified by the American *Publishers' Weekly* under the head of education and languages, is 197; the number in Great Britain, as given by the English *Publishers' Circular*, is 556; while the number in Germany, as given by the *Börsenblatt*, is no less than 2,300. To this last number, moreover, ought to be added, perhaps, 501 works that are classified as "Modern Languages and Old German." In the field of fiction there is a noteworthy variation in the proportions that elsewhere prevail. Owing, doubtless, to the vast number of "pirated" cheap reprints in the United States, the number of American publications under this head is 670, while the number in Great Britain is 349, and in Germany—evidently not so inviting a field for the "pirates"—the number is 1,207. In the literature of law and jurisprudence America produced in 1883 397 works; Great Britain, 139; Germany, 1,301. Though the systems of classification are not quite uniform in the three countries, they are approximately so, and the figures leave no doubt that in nearly every branch of learning the number of publications in Germany is about twice as great as the number in Great Britain and the United States combined. Of the comparatively small number of valuable books published in America, it would be interesting to be informed what proportion represents the work of American authors. No one can look over the statistics with care without being convinced that the year 1883 in the United States is distinguished by the paucity of its contributions to literature. How far this is owing to the absence of an international copyright law is at least an interesting subject for thought.

—In England a "Company of Authors" has been organized for the purpose of doing what it can to bring about that happy day when authors will not vex publishers, and publishers will not vex authors. That there is need of such a society has been evident ever since Thomas Campbell offered his famous toast to Napoleon Bonaparte, "because he shot a bookseller." But it is not so evident that the English "Company of Authors" has made a good start. The prospectus does not show that the enterprise has enlisted any considerable number of the greater names of contemporaneous authors, and without such names it is hard to see how any considerable success can be reached. Perhaps the fact of their absence is to be accounted for by the circumstance that the assistance promised by the Company is not needed by authors of the highest reputation. Among the aims of the new organization is to be noted "the cultivation of mutual help between authors, so that the young and struggling writer may look for and obtain friendly guidance and counsel from those who have already made their reputations." The prospectus informs us that the Company will not only give the members information on all points connected with publication, but also "will assess the merits of any MSS. that may be submitted to them for inspection," and "advise on all questions arising between author and publisher." It further intimates that the Company will endeavor to clear away much of the popular ignorance as to the cost of printing, binding, and advertising, and as to the best way of bringing a work before the public. Conspicuous also among the aims of the society is "the united and strenuous endeavor by every possible means to obtain for English writers the justice of copyright in the United States." The scheme to which the Company seems committed is that of Mr. Charles Reade, the substance of which is quoted with approval, and no stone will be left unturned "to awaken the nation to a sense of the injustice and iniquity of the present absence of international copyright."

—The aims of the "Company of Authors" seem to be so eminently praiseworthy, that it is not easy to withhold our best wishes for its success. It will doubtless do something to enlighten public opinion; but to suppose that it will bring about generally harmonious and sympathetic relations between authors and publishers, by any means hinted at in the prospectus, is to leave out of sight not only the essential elements of correct business relations, but also one of the fundamental characteristics of human nature. The real causes of dissatisfaction lie deeper than those assigned. The relations of authors and publishers are purely business relations, which are not conducted ordinarily in accordance with business principles. The author surrenders his MS. to the publisher, and receives in return a contract which promises a certain percentage on the copies sold. When the first accounting is made, it is probable that in nine cases out of ten there is disappointment on the part of the author. The reason is simply, let us assume, that in a vast majority of cases the author's first estimate of the importance of his work is greater than the importance attached to it by the public. But this cause of disappointment could not be charged upon the publisher, if the publisher were to prove to the perfect satisfaction of the author that all the copies sold have been accounted for. The publisher has only his word or the word of his bookkeeper to give. He has received what to the author is an indefinite quantity; that is to say, he has had printed an edition the number of copies in which the author has no means whatever of knowing, except from the publisher himself. The vicious nature of this general system is made clear by the simple statement that it affords an opportunity for cheating such as is afforded perhaps in no other business relation whatever. So long as this opportunity exists, and so long as there is a liability to disappointment on the part of authors, there will continue to be more or less of distrust and dissatisfaction.

—'The Teaching of the Twelve Apostles' (Scribners), Greek text with translation by Professors Hitchcock and Brown, of the Union Theological Seminary, New York, appears to be a valuable contribution to the Christian literature of the second century. A work of this name is cited among the apocryphal writings by Eusebius and Athanasius, and modern scholars had surmised its general character, but no text of it was known. Last year Philotheos Bryennios, Metropolitan of Nicomedia, published the Greek text of a small treatise entitled 'Διδαχὴ τῶν δώδεκα Ἀποστόλων,' from a manuscript of the eleventh century found by him in Constantinople in 1875, and from this the present translation is made. If we may accept it as a genuine production of the second century—and the internal evidence strongly favors its genuineness—it throws a curious light on the way in which Christianity was then conceived. The ethical part of the tract follows in general the precepts of the Sermon on the Mount and the Pauline epistles, but with a few noteworthy differences: the Golden Rule is put in negative form; instead of "Pray for them that persecute you," we have "Fast for them"; almsgiving is regarded as a ransom for sins; there is a definite warning against magic arts; and the methods of detecting false apostles and prophets are clearly stated: a sojourning apostle who stays three days at one house, or, on departing, asks for money, or one who orders a meal in the spirit and then himself eats of it, or one who does not what he teaches, is a false prophet. The ritual and governmental ideas are especially remarkable. The church officers spoken of are bishops and deacons, the "bishops" being doubtless identical with presbyters or elders; but the statement is too curt to found a theory of church government on. For baptism running water is preferred, though not held to be necessary; whether then the method is by immersion or affusion, is not clear. If cold water cannot be had, warm is allowed; and in the absence of a large mass of water it is directed that the administrator pour water thrice on the head of the candidate. This makes pouring a recogized mode of baptism fifty years after the death of the last of the twelve Apostles. In the celebration of the Eucharist the most noticeable thing is the complete absence of the idea of atonement; there is only thanks for "the holy vine of David thy servant, . . . and for the life and the knowledge which thou hast made known to us through Jesus thy servant." The conception of the rite is much less theological than that given by Justin in his First Apology. One is half disposed to think that our author was a Judaizer (he enjoins that the first fruits of wine-press and threshing-floor and oxen and sheep, and the first of a baking of bread, and of a jar of wine or oil, and of money and clothing be given to the prophets, whom he calls "your highpriests"—quite in the manner of the Old Testament); or that he belonged to some heretical

sect. However, it may be that he does not give the whole of his Eucharist-ritual. He is not a philosopher like Justin, nor a man of cultivation like the author of the Epistle to Diognetus, but a plain exhorter, who is concerned only to teach righteous living. There may have been in his mind vague theological ideas which he does not express. In speaking of baptism he says nothing of Justin's bath of regeneration, but confines himself to a bald statement of the outward ceremony. We can hardly, therefore, infer from the absence of the idea of atonement in his account of the Eucharist that there were Christians of that day to whom this idea was unknown —a state of things very improbable for that period. Moreover, he does seem to speak further on of "breaking bread" as a sacrifice. This tract is to Justin and the Epistle to Diognetus as the Epistle of James to those of Paul—a simple, straightforward, earnest exhortation to uprightness of life. Its Greek style is just what we should expect in such a writing in the middle of the second century. The picture given of the life of the Christians agrees with that which we find in the works known to belong to that time; and it enables us to understand how this compact body, with its lofty, unbending ethical code, made a deep impression on the heathen community. The relation of our author to our present New Testament text is too large a question to enter into here. The translation is very well done.

—One of the most interesting illustrations of the underlying religiousness, if that word may be allowed, of the American people has been shown within the last month by their reception of the 'Teaching of the Twelve Apostles.' A translation of the text, given by Harnack in a German theological journal, attracted the attention of the editor of a weekly religious journal in New York, who published an English translation of this German version. As soon as the text of Bryennios was received, professors in several institutions set about its republication in this country. The New York professors were first in the field with their edition of the Greek text, accompanied by a translation and brief comments. The Andover professors followed almost the next day with an independent translation, and a scholarly critique. A Baltimore professor at once gave four lectures on the text, to a company of students augmented by a number of ministers, Episcopal, Presbyterian, Methodist, Congregational, Quaker. A pastor in New Haven made the tract the theme of a pulpit discourse on Sunday. Almost every daily and weekly paper, which has come under the writer's eye, has contained a longer or shorter article on the subject—one religious sheet closing its notice, a column long, with the comatose remark, that the discovery will be of interest to students of church history, but to nobody else. A daily newspaper reports that twelve hundred copies of the New York reprint were sold the first day. In a Southern Young Men's Christian Association, a teacher of elocution was engaged to read aloud the tract to the members of the Society. Now, what does all this indicate? There is, as we have just shown, nothing reconstructive or destructive of Christian doctrine in the pamphlet. There is nothing polemic or apologetic about it. The early usages of the Church are indicated on some points a little more clearly than elsewhere, but there is nothing very decidedly to the advantage of any denominational creed or polity. Why then such eagerness in the American reception of this tract—so different from the German or the English reception—so very like the reception accorded to the revised New Testament, eighteen months ago? Is it Hebraism, or is it Hellenism; is it Americanism, or is it Puritanism? A shrewd observer, to whom we put the question, says, that Puritanism was essentially a rehabilitation of primitive doctrine, and to this he attributes this outburst of patristic zeal. On the other hand, the extreme ecclesiastical party, the Episcopal, has professed to be rehabilitating early usages. The Methodists also have aimed to be primitive Christians. So, too, the Irvingites, who believed that the apostolic rule was restored. All these elements appear to be combined in giving an eager welcome to the document before us. At all events, it is obvious that however creeds may differ, there is still in this country the most profound interest in religious questions, ready to respond to any new and fresh utterance of truth, whether it be an apostolic statement reaching us through the historic telephone from a period seventeen centuries ago, or the fresh restatement of an evangelist of our own day.

— Emanuel Geibel, whose death, at the age of sixty-eight, the cable announced a few days ago, was probably the greatest German poet of the present day, unless preëminence is to be accorded to Friedrich Bodenstedt. The lives of the two poets, indeed, present many points of resemblance. Both derived their early inspiration from travels in the East; both were tutors in the houses of Russian noblemen and subsequently became professors in the University of Munich; both acquired fame as translators from many languages only equalled by that of Rückert; and both vainly aspired to dramatic laurels commensurate with those won by them in lyric poetry. But while none of Geibel's productions achieved the renown and popularity of Bodenstedt's 'Songs of Mirza Schaffy'—those unique pseudo-translations from the Persian—his muse was more varied than Bodenstedt's. His ballads are among the finest in German literature, taking rank, after Schiller's and Goethe's, with those of Bürger and Uhland. He translated equally well from the French, Spanish, Portuguese, and modern Greek; and his recently published translations from Horace earned from a prominent German critic the encomium that they occasionally even surpass the original. Geibel outlived the reproach made him in his earlier years of having been chiefly a "ladies' poet," but his songs never really fired the popular heart as did those of Uhland and Herwegh. Indeed, he had little in common with the "bards of liberty," his famous utterance, "I will not be the slave of liberty," being characteristic of his reserve and conservatism; but the modern development of Germany found in him a warm and eloquent interpreter.

—At the Normal College may now be seen the series of electrotypes of the select coins of the British Museum which have been purchased for the Numismatic Society, to whose cabinets they will return after a further exhibition in various places in this city. No form of art among all which the Greek genius has left us is so serviceable for art-education as its coinage. Its compactness, its variety (scarcely two known coins of any type being of the same die), the wonderful range of subject and variation in treatment of subject, its portraiture, symbolism, idealism, its extraordinary power of rendering the largest qualities of plastic art in the compass of a coin, and the range of treatment of relief, from the lowest bas-relief to the highest, falling short of detached relief, are qualities which are combined in no other class of antique art products. This series, furnished by the authorities of the British Museum at a less cost even than that of some single original coins in the collection, should form a part of every art museum in America, and not much out of place would it be in our Mint, if anything could be hoped for in the way of artistic design from the men who furnish what must be admitted to be the least artistic coinage in the civilized world. The material for study in the finer qualities of art, the composition of line and mass, the vivacity and movement of the figure, the subtle management of relief in this series, which make the great glory of Greek art, will serve as an educator of taste more potent than all our city museums and collections put together. There is an additional value, not the least either, in the ancient coinage of Greece, that it shows the rise and decline of art better than any collection of statuary, because it carries its chronology with it. The present collection is divided into the periods of coinage from 700 B. C. down into Roman times, and the four earlier periods, coming down nearly to our era, will, so far as art is concerned, show all but its decay, and even the beginnings of that. Of special interest in the archaic period are the coins of Tenedos and Lampsacus, Posidonia and Metapontum (of Magna Græcia) not to be surpassed in delicacy and purity of design, and the last as showing the primitive manner of coinage at its best. In the second, the series of Elis, of Thebes, the lovely coins of Phæstus in Crete, of Naxos, Segesta, and Selinus in Sicily, of Thurium, Velia, Metapontum, and Tarentum, in Magna Græcia, and the perfection of Greek coinage from the cities of Amphipolis, Cyrene, Opus of the Locrians, the Arcadian League; and above and beyond all, not only for its beauty, but for its range through so many periods, the Syracusan series, will delight as well as educate all students. In the fourth period the portraits are the great attraction, and form the chief value of the epoch. Numismatic portraiture probably begins with the coin of Philistis, Queen of Hiero II. of Syracuse, and ends, as art, with the later Kings of the Macedonian dynasty of the East, that of Lysimachus being perhaps the finest, though as type of beauty a choice coin of Philistis bears the palm of all, earlier or later. The adaptation of the character of the coinage to commercial uses is well shown in the modification of the character of the relief, passing from the high, full modelling of the second and third periods to the flat coins of the fourth and succeeding, fit for packing into rolls, when money became plenty enough to be sent in large sums. This series includes coins of the Phœnician cities, Carthage, Tyre, Sidon, etc., as well as the Hebrew shekel. It is but a sample of the numismatic art which has come down to us, however. An eminent Italian collector has about 300 different types of the didrachm of Tarentum alone.

—Dietrich Reimer (Berlin) sends us an atlas of Mykenæ and environs, with two large maps, one of the city (17x22 in.), showing the excavations of Schliemann, and the other (19x21 in.) the city with the surrounding country as far as the Heræon, and including the "Mount St. Elias" (Helios), where are some remains of a Pelasgic temple and *hieron*. To say that the maps are the work of the German Staff is to assure their complete fidelity and topographical value. That the archæological indications are not of the same value is clear from the characterization of the structures about the monument excavated by Schliemann: the rude walls which surround and connect the ellipse of that structure with the preëxisting city wall being described as Cyclopean—a term equally applied to the city wall itself. The former are simply barbarous stone constructions, with no special technical character, and enclosing material borrowed from the ruined city, and are not to be classed with its original structures, being clearly of long subsequent date. The identification in the map shows that the authors had no recog-

nition of the technical distinctions between the various forms of structure which abound in the vicinity of Mykenæ. Apparently all the rough stone walls in the section delineated are indiscriminately marked "Cyclopean," although many of them are clearly nothing but terraces to hold up the arable land, and belong to all epochs except the most modern. This want of accurate classification of the remains of wall structure is unfortunate, as on it must depend the determination of the archæological position of any given fragment. The postern gate of Mykenæ, again, is placed at the bottom of the recess in the wall, while in fact it is at the opening of it; and the portion of wall which flanks it on the north, and is described as a tower, is simply the wall sufficiently thickened to stand alone, and faced on both sides, as they are both exposed, with worked stone. The explanatory hand-book which accompanies the atlas contains an admirable map of the entire Argolid, including Nauplia, Corinth, etc.

THE NEW ENGLISH DICTIONARY.—I.

A New English Dictionary on Historical Principles; founded mainly on the materials collected by the Philological Society. Edited by James A. H. Murray, LL.D., President of the Philological Society, with the assistance of many scholars and men of science. Part I.—A—Ant. Oxford: Clarendon Press; New York: Macmillan & Co. 1884.

THE first instalment of a great and long-desired work has finally made its appearance. Originated in 1857, carried on for some years and then practically abandoned, resumed again in 1879, it has seen, since the time of its inception, nearly a generation of men pass away before the first fruits of the immense labor expended upon it could be offered to the public. The delay, while in certain respects it has been annoying, is not on the whole to be regretted. It has been advantageous on many more accounts than those which would necessarily be implied in the opportunity given to embody the knowledge which has accrued in the interval. Severer methods of investigation and higher ideals of requirement now exist than did twenty-five years ago. Stores of information practically inaccessible then are now laid open. The extensive dictionary of German, begun long before this one was even contemplated, has, to be sure, hardly got beyond the middle of the alphabet; but, during the period under consideration, a great work of lexicography has been completed in that foreign tongue from which the English speech has borrowed a large proportion of its words. Not merely is the information the latter contains of especial importance, but the methods it employs furnish a standard to be imitated and, if possible, to be surpassed. Again, without intending to express any disrespect for the men who have had charge of this undertaking in the past, it is safe to assert that the present editor is in many points far better equipped for the work than those who conceived it and for a time carried it on. These various advantages have far more than counterbalanced the disadvantages of the delay. It is an act of simple justice to say that if this lexicon is completed on the plan on which it has been begun, it will take equal rank as regards its intrinsic excellence with the two great works published or publishing in French and German, and in many matters of detail will be superior to them both.

Such a statement implies more than it directly asserts. The difficulty of preparing a lexicon is far greater in the case of English than in that of any modern cultivated tongue. The other languages of Europe are comparatively homogeneous. The words they have adopted from foreign sources are limited in number; and, moreover, they have been largely introduced during periods when it is a matter of no special difficulty to trace their history and development. Not so with the English. It is not merely that its ordinary vocabulary is, to begin with, half Teutonic and half Romance: in each case these two elements have been subjected to peculiar influences that do not affect the character of any Teutonic or any Romance tongue elsewhere. The French that was carried over to England by the Conquest diverged in time not merely from the French of Paris, but from its parent dialect of Normandy. The Low-German that was brought to Britain by the English sustained more or less modification, and received more or less admixture, from the speech of the Norse invaders and settlers. In addition to this, the restless race that speaks our tongue has, during the various periods of its history, come into contact with almost all the peoples of the earth. There are few of them from which it has not borrowed some vocables that have finally become part of the common stock of communities scattered over the habitable globe.

This state of things of itself renders the task of preparing a dictionary of English one of special difficulty. When to it is added an immense literature which, in one form or another, runs back more than a thousand years, the task assumes enormous proportions. In this work the editor sets out to include all words that have been in use since the middle of the twelfth century. Up to the fifteenth century all dialectic forms and variations are registered. After that, it is only the literary speech that is regularly recorded. The work when completed will be, in consequence, a dictionary of early English as well as of modern English. It is only the special student who will fully appreciate the immense labor of registering the numberless forms in which words appeared in the various dialects during the twelfth, thirteenth, and fourteenth centuries. Still, the ordinary reader can get some conception of the drudgery gone through in collecting, as well as the knowledge and accuracy required in condensing, such a mass of information, by consulting the variant forms under, for instance, *abide* and *ambassador*. This point needs to be emphasized, because, while work of this kind involves extraordinary toil in its preparation, it is packed away in so little space as to escape the attention of most.

Even without regarding these variant forms, the number of words recorded is something formidable. The part published ends with the suffix *-ant*, and its 352 pages embrace, according to the statement found in the preface, 8,365 words. A comparison with the corresponding portion of Webster will give a more definite conception as to the scale on which the present work is planned and carried out. The number of words in Webster under the letter A up to *ant* are a little short of 3,550, and they cover fifty-six pages. This proportion may not hold through the rest of the alphabet, but if it does, the words included in the present dictionary will be nearer 300,000 than the 200,000 that have been generally fixed as the approximate number. One specially interesting feature is also to be noted. The earliest and latest known instances of the occurrence of a word or of the sense of a word are always given with the exact date of each. These instances will inevitably be subject to great revision, in consequence of the discovery of still earlier or later forms or usages that are sure to be made with the information here contained as a basis upon which to proceed: but even now their value is as great as their interest, and the latter it is hard to overestimate.

There are three things in which the excellence of a dictionary mainly consists—the number and choice of words, their derivation and history, and the definitions of their meanings, with illustrative quotations. That the present work is not perfect, that it is fairly subject to some criticism, we shall have occasion to show before we finish. Yet in all three it reaches a high standard of achievement. Errors of detail will be pointed out in future; new light will make clear what is now imperfectly understood; but the general features are not likely to undergo any material alteration. This is especially true of the department of etymology. This portion of the work, abounding as it does in words from the Romance element, has indeed presented no special difficulties. Still, so far as it goes, it is eminently satisfactory. It is full where it is desirable that it should be full. On the other hand, it has avoided with a wise restraint the tracing of words to primitive hypothetical Indo-European roots—which seems to us a serious defect in Professor Skeat's very excellent 'Etymological Dictionary.' We could have wished in one or two cases that the editor had given us, as part of the history of the words, some illustrations of those excesses in derivation in which the scholars of the sixteenth and seventeenth centuries fairly rioted. We instance the etymology of *almanac* given in Verstegan's 'Restitution of Decayed Intelligence.'

"They used to engrave," writes Verstegan, "upon certain squared sticks about a foot in length . . . the courses of the moons of the whole year, whereby they could always certainly tell when the new moon, full moon, and changes should happen, as also their festival days; and such a carved stick they called *al-mon-aght*, that is to say *al-mon-heed*—to wit, the regard or observation of all the moons. And here hence is derived the name of almanac."

Now this is certainly a very decayed sort of intelligence, but it seems to us to enter legitimately into the plan of a work which is largely taken up with recording the decayed ignorance of the past about words.

Etymology is a subject, however, which is in a constant state of development, and this part of the work can be dismissed with the statement that what is found recorded here is fully up to the present level of knowledge. When we come to words and definitions, there is ampler field for criticism, and what we are disposed to consider in some cases as mistaken fault finding. It is not likely that the editor would contend that the vocabulary contained here, immense though it be, is exhaustive. Five thousand authors have been read for this work, but English authors of the grade included in this dictionary number many more than five thousand. No one need fear that a great harvest of words does not still remain to be gleaned, especially from writers of an inferior class. The hope, indeed, of finding terms not included in it seems already to have stimulated many to examine obscure works that have probably never been read before during the present century, and are likely never to be read again. But this state of things is full justification for the course which the editor has been somewhat criticised for taking. He has admitted into the dictionary all words occurring in previous dictionaries, even when found nowhere else and apparently mere coinages of the individual lexicographers. It is unsafe to reject them, however, until the whole field of our literature has been gone over carefully and it has been shown by an exhaustive process that the word was never used in our speech.

Again, we are disposed to say that the criticism which has found fault with the numerous technical words included in this first part is hardly justifiable. That they are numerous, and give at times an extraordinary appearance to

the page of a so-called English dictionary, cannot be denied. But this is a point upon which there must always be the widest difference of opinion, because the technical vocabulary of an educated man is profoundly affected by his pursuits and his associations. Terms which seem to one person little less familiar than the words which are the expression of universal thought or feeling, may be to another not much removed from unintelligible gibberish. No one man can judge as to the propriety of introducing technical words. Absolute discretion in this respect must be left to an editor, because he has better opportunities than any one else to meet the views of wide circles. He may make mistakes, but he is not so likely to have made them as the man with a more limited range of vision, who censures him for introducing words he himself has never seen or heard before, and never expects to hear or see again.

MUSIC IN AMERICA.

Music in England.—Music in America. By Dr. F. L. Ritter. Charles Scribner's Sons. 1883.

PROFESSOR RITTER has added to his previous valuable works on music these two volumes on musical history in America and England, which will be read with general interest. They are refreshingly free from pedantic, stilted phraseology, while the facts and opinions are expressed in a lucid style and with commendable frankness. The author does not content himself with a dry enumeration of events, but continually discusses the social aspects of his topic. His intention at first was to write only the history of musical development in America, but he soon came to the conclusion that a short preliminary volume on England would greatly facilitate comprehension of the early epochs. The first volume accordingly discusses the English ballad and Gregorian chant in their relation to national taste; the early contrapuntists; the composers of the Elizabethan epoch; the decline of musical art under Puritan rule; music in the Catholic, Lutheran, and Calvinist churches; the English cathedral service; English psalmody; and the history of opinions regarding musical æsthetics (about 60 pages), which may be regarded as a valuable supplement to Ehrlich's history of musical æsthetics in Germany since Kant. Much good would result if every clergyman in the country would read this first volume, which, the author hopes, "may possibly contribute towards removing the unreasonable prejudices entertained by many church members against music as an art: most of these prejudices are based on inherited traditional misunderstanding, or complete ignorance of the subject in question."

In America the history of music does not begin, as in Europe, with legends of Mercury and tortoise shells, but with the attitude towards it of the early Puritans. To them belongs the credit of having killed all musical spontaneity and originality in England up to quite recent times, and of having prevented the present generation from enjoying the works of a school of music which would doubtless have been as distinct and national in its flavor as the music of Italy, Germany, France, Hungary, and Poland. The germs were there, but fanaticism killed them. To psychologists a more remarkable problem has never presented itself than the explanation of this violent antagonism towards a harmless and refining art. A reaction against the excessive frivolousness of a pre-Puritan epoch is generally given as the cause, and this is evidently allied with the mediæval ascetic habit of condemning every pleasure as sinful. The Puritans, it has been said, condemned bear-baiting not because it gave pain to the bear, but because it gave pleasure to the spectators. Perhaps in a similar way they, in their hearts, objected to music because it added to the happiness of its lovers, not because they considered it antagonistic to religion. Doubtless, also, an impotence of judgment must be taken into consideration—an inability to look at music apart from the frivolous surroundings with which it was often associated. Whatever may be the causes, the struggle of liberalism against ignorant prejudice presents many curious phases, which Dr. Ritter describes in the first chapters of his second volume, so that they possess a special interest even if the crude and incorrect religious tunes of the period in question can hardly be said to come under the head of music proper

In so far as music was tolerated in the early part of the last century, it was of a very peculiar quality. Only a few artificial tunes were allowed, and any innovation was regarded as sinful, just as among the ancient Egyptians. It was urged that time was wasted on music; that it was a contrivance to get money; that the names of the notes were "bawdy, yea blasphemous" (!); that the tolerance of regular singing would lead to the introduction of sinful instrumental music—this being allowed much later than vocal music, probably because the latter alone was capable of redemption through being wedded to religious words. And when we read how music was performed in those days, we do not wonder that many considered it the invention of the Evil One. One writer remarks that "we used to have some people singing a note or two after the rest had done. And you commonly strike the notes, not together but one after another, one being half-way thro' the second note before his neighbor has done with the first." "Some singers," we are told, "drawl out their notes beyond all reason; hence in congregations ensue jarrs and discords, which make singing rather resemble howling." Sometimes the notes were so much prolonged that, says Thomas Walter, "I myself have twice in one note paused to take breath, . . . and besides no two Men in the congregation quaver alike, which sounds in the Ears of a Good Judge like five hundred different Tunes roared out at the same Time." The climax was probably reached in the case where a minister, after a bad performance of his choir, read another psalm, and said, "You must try again, for it is impossible to preach after such singing."

For a long time the psalm-tune writers, Billings and his followers, had everything their own way, and it was not until the introduction of Italian and German musicians that good music began to obtain a footing. To-day traces of the psalm-tune epoch are to be found in our cities, while in country towns, East and West, it still retains much vitality, as is shown by the enormous quantities of (mostly trashy) Sunday-school and church music-books that are manufactured and sold every year. In our largest cities, the foreign element has slowly but surely made an impression. The Italians introduced the taste for highly-spiced and beautiful solo singing, and the wealth of the New World has always attracted the most famous European singers in such large numbers that it has at last resulted in their being more incisively and severely criticised on this side of the ocean than on the other. The love for choral music of a worldly kind was introduced by the German *Männergesang-Vereine*, and such early American choral associations as the Handel and Haydn in Boston. Orchestral and chamber music came to us entirely from the Germans, and how much it has remained confined to them could not be more strikingly shown than by the fact that when Mr. Theodore Thomas at the present day addresses an orchestra of 100 or 150 men, he uses the German language. There is, however, now growing up a generation of young American pianists, organists, and other instrumentalists, who are destined at no distant time to compete successfully with their German teachers; and, as for song, it is well known that Italian vocalists have become very scarce, and that Europeans have lately taken a great fancy to American singers, who may ultimately succeed in finding honor in their own country too.

Dr. Ritter gives detailed accounts of the earliest vocal and instrumental societies established in this country. To what factors he assigns special importance may be seen from the titles of the five periods into which he divides his history, viz.: Puritan Psalmody; The First American Composers; Establishment of the Boston Handel and Haydn Society, 1815; Introduction of Italian Opera, 1825; Establishment of the New York Philharmonic Society, 1842; Civil War. Among the most valuable features of the book are the tables giving a list of the most important works performed each year by the societies here mentioned and some others. By far the most significant *individual* factor in the development of music in America hardly receives sufficient attention. We mean Mr. Theodore Thomas, to whom only a page and a-half are devoted, whereas in proportion to his influence a whole chapter would not have been too much. Ever since he came to this country, almost forty years ago, Mr. Thomas has devoted his time and remarkable powers to the object of arousing an interest in good music. His standard was so high and his opposition to clap-trap and humbug so determined, that many were his disappointments, such as would have crushed a less energetic person. But he persevered, and to-day he stands recognized as one of the greatest conductors of the century and the most prominent musical figure in America. When he gave his famous symphony concerts in opposition to the Philharmonic Society, that association found that the only way out of their difficulties was to make a bold move and capture the general himself of the opposing army; and with him at the head this society in a short time became the equal of any European orchestra. Mr. Thomas not only, throughout his career, has endeavored to educate the metropolitan taste for classical and modern music, but has travelled with his orchestra all over the country, and thus produced an effect which is simply incalculable, since it is well known that nothing stimulates musical enthusiasm and a determination to study so much as the hearing of a perfect performance. Mr. Thomas's performances, too, have differed widely from those of most other travelling companies. It is customary to produce a new play or operetta in the metropolis with a good cast, a fine chorus, and a fair orchestra, so as to secure a long "run" and the favorable verdict of the press. Then the company is split up into several new ones, inferior performers are quietly substituted, and then sent north, south, west, and east to entertain provincial audiences, who must often wonder what those New York critics (whose articles are used as advertising puffs) *could* mean by praising such performances and such pieces, which, of course, lose all their good qualities by being thus misinterpreted. Mr. Thomas's procedure is very different from this. He does not, indeed, take his full orchestra into the country, but he takes as many as are needed, and they are the same men as are heard in New York, and all trained to perfection, or as near it as circumstances permit.

Of musical humbug there is unfortunately a great deal in this country. As Dr. Ritter observes, "some cities, and especially the rural

districts, are still the fat pastures on which an army of musical charlatans, ignoramuses, and cunning adventurers feed, under the names of convention conductors, leaders, organizers, lecturers, teachers, performers, &c." They profess to teach composition in a dozen lessons, singing or piano-playing in a month or two, and other atrocious impossibilities. Professor Ritter says he has a fund of amusing anecdotes and experiences illustrating the state of musical culture in America, which he promises to publish in a future volume of a more autobiographical cast. He has been criticised for omitting from his book the names of the more prominent American composers of the present day. But in the preface he states that he is engaged on a 'Dictionary of American Music and Musicians,' in which ample atonement will doubtless be made; and as all genuine artistic composition is of very recent date, it need not necessarily be included in a history of music. The only genuine *American* composer, whose songs are not mere outgrowths of European schools, is Stephen C. Foster. To him several appreciative and interesting pages are devoted, in which the relation of his compositions to the Southern negro melodies is pointed out. It is, indeed, a singular fact that these slave-songs are the only indigenous tunes we have. Folk-song there is none in America, and the author is inclined to attribute this also to Puritan influence; for "from the hearts of such people, in whose eyes an innocent smile, a merry laugh, was considered a sin, no naïve, cheerful, sweet melody could possibly spring."

Travels in Mexico, and Life Among the Mexicans. By Frederick A. Ober. Boston: Estes & Lauriat. 1884.

Mexico from the Material Standpoint. By Alexander D. Anderson. Washington: A. Brentano & Co.; New York: Brentano Bros. 1884.

Mr. Ober's book will hardly escape being considered belated. Five-sixths of it, as he tells us, was ready for the press a year ago, being based on the observations of a journey in '81-'82. "But perceiving a greater need of the public for full and authoritative statements regarding the resources of Mexico, and descriptions of the border region, . . . he laid aside his manuscript for a while and essayed another journey southward." It seems to us that the delay was but poorly made up for by the additional 100 pages which resulted. There is a tide in the affairs of books of this sort which it is well to take at the flood—certainly so if the main hope is to be led on to fortune by large sales. If Mr. Ober could have foreseen that, between the time of his journey and the time of his publishing, no less than fifteen books on Mexico would appear in English, some of them excellent pieces of work, it is probable that he would have been less indifferent to the growth of the beard in the shaving. As it is, he has allowed the field to be occupied by several dangerous competitors for public favor, and has permitted the lapse of time to vitiate some of his statements. It is rather amusing, for instance, to find him saying (p. 209) that he does "not fear to predict for 1883" a coffee crop of 10,000,000 pounds. This, for a book published in 1884, is a specimen of ex-post-facto prophecy quite after the heart of Kuenen.

Yet this unfortunate delay in publication ought not to blind us to the solid merits of the book. Its mechanical execution is altogether admirable, in fact sumptuous. The letter-press has that clearness and accuracy—if we except occasional slips in the Spanish, for which we presume Mr. Ober must bear the responsibility—which we are accustomed to expect at the hands of the University Press. Of the 190 illustrations, nearly all of the new ones are good, some real gems, while the reproductions have at least the charm of old friends. The style is not always as clear as one could wish, and sometimes drops into vulgarisms which may have been due to too great intimacy with the writer's friends the engineers; but, on the whole, is smooth and varied. There are passages giving striking descriptions. Take this as an instance: "In no country in the world can you pass so rapidly from zone to zone, from the blazing shores of the heated tropics to the region of perpetual winter, from the land of the palm and vine to that of the pine and lichen—for in twenty hours this can be accomplished, and the traveller may ascend a snow peak with the sands of the shore still upon his shoes." Who that has ever committed himself to the tender mercies of a Mexican "royal road" can fail to appreciate the following recipe for its manufacture? "Take one of our country lanes, cut ditches across it, dig deep pits in it, demolish a stone wall and cast it into the centre of it, run a few streams through it, and slush the whole over so that one can hardly keep his footing on it, and you have a Mexican country road in the rainy season."

Mr. Ober's accuracy, where he is not out of date, is highly commendable, and his close observation has hit upon many characteristic traits of Mexican life which tourists of less keen vision have passed over. He makes the curious mistake of putting the great Judas festival on Good Friday (p. 292), when its universal designation, *Sábado de Gloria*, should have taught him his error. He is wrong in saying that "no grave can be held longer than for a certain term of years" (page 265). Of the eleven cemeteries of Mexico City, all but one sell lots "á perpetuidad." Our author's botanical and archæological attainments stand him in good stead, and yield many an interesting identification. He does not, however, make good his somewhat boastful claim to have "enumerated and particularly described all the principal ruins and groups of ruins in Mexico" (p. 323, note). There are important ruins, within a day of Mexico City, which he does not mention.

The first part of the book, which recounts Mr. Ober's travels and explorations in Yucatan, constitutes one of its most interesting and original features. It is only the hardy tourist who goes further inland than Mérida. The single exception to be taken to this portion of the narrative is that it is not always possible, without close scrutiny, to be sure when Mr. Ober is telling us something which he himself has seen, and when he is taking a description from the older explorers. Thus one would be persuaded that some at least of his accounts of the Palenque ruins were given at first hand, were it not clear, from his itinerary, that he did not lie over a single steamer at Frontera. We do not at all wish to intimate that there is anything underhanded in this, but simply think it would have been better to draw the line a little more sharply between what is independent observation and what is borrowed description. Every traveller who is bold enough to defy the discomforts and dangers of the route to the great ruined cities comes back enthusiastic over the grandeur and suggestiveness of those enigmatic remains. We remember to have heard Prof. Alexander Agassiz declare that the ruins of Uxmal were the most stupendous thing of the kind in the Western hemisphere, not unworthy to be named beside the kindred glories of Karnak or Phylæ. Yet they are left almost absolutely unprotected, open to the most wholesale pillage, and undergoing rapid destruction. The Mexican Government has its face set too steadfastly toward the future to cast so much as a glance at these priceless treasures of the past. An appropriation of $100,000 would probably insure the preservation of what now remains, but everything has to make way for railway subsidies. If the riddle of these gigantic structures is ever to be truly read, the ruthless vandalism which is despoiling temple after temple, for the sake of building houses and fences (p 66), and which has already gone so far as to make some of the porticoes and façades figured and described by Stephens unrecognizable (p. 72), must somehow be stopped.

Whatever may be the case with these ruins of Yucatan, left so wholly on one side of all the frequented and comfortable routes of travel, it is certain that the new light poured upon the ruins of Central Mexico is calling for a revision of the older theories as to the high attainments of the Aztecs at the time of the conquest. Solis and Prescott are romancers, Wilson goes to the other extreme and abuses the privilege of doubting, as Milman said of Gibbon; yet the truth lies between the two and nearer Wilson than Prescott. Three hundred and fifty years, even with the holy intolerance of Spanish zealots thrown in, are not enough to account for the almost total lack of proof which the remains give of the extravagant and conflicting reports of the conquerors. It is almost incredible, on the face of it, to one who has seen the present Indian population of Mexico, patient, stolid, docile, tractable hewers of wood and drawers of water, that they can be the descendants of fierce and high-spirited warriors. Mr. Ober rightly emphasizes the possibility of valuable artistic results from the suggestions of historic association, natural scenery, and social customs which come to one from every quarter in Mexico. Unfortunately, native talent has thus far employed itself almost exclusively in "blindly copying saints, cherubs, angels, and ecclesiastics" (p. 326). Mrs. Foote's sketches in the *Century* of two years ago ought to serve as a hint, to painters, of the untrodden and delightful paths which await their feet in Mexico.

Mr. Anderson's pamphlet of 156 pages is a painstaking and conscientious compilation. His information is taken from the best authorities and is, so far as we have examined it, worthy of confidence. Yet we cannot help thinking that he wears rose-colored glasses. The question of the success of the thousand and one railroad enterprises, mining ventures, commercial undertakings, in which American capital is being so lavishly embarked, he does not consider to admit of argument. That Mexico is to see in the near future a wonderful development of her natural resources, and to experience a quickening of her whole national life, no one doubts. But it is easy to let one's fancy run away with him, when dealing with vast possibilities, and to overlook the necessity of gradual development, even in the nineteenth century. So it seems to us that Mr. Anderson does not give due weight to the objections to his argument, and rushes on to his wished-for conclusion with too great ease and certainty, as of a mathematical demonstration. He speaks with enthusiasm of the great undeveloped resources of Mexico in agriculture. Yet he scarcely alludes to the necessity of irrigation, the lack of facilities for which makes great stretches valueless, nor does he seem to be aware that all the really fertile and easily worked lands are already occupied. In like manner of mining. It is very tempting to read of the large annual production of gold and silver. But it ought to be remembered that the mining business is even more uncertain in Mexico than with us, and that, as is stated by good authority, fully as much foreign capital has been sunk in Mexican

mines, during this century, as has been taken from them. So, too, of the confident prediction that a limitless demand will soon spring up for our manufactured goods. It is, indeed, hard to be incredulous as the enthusiastic railroad agent displays before you his maps, and shows you how his line here strikes a city of 40,000 inhabitants, there one of 80,000, and just beyond one of 125,000. But you cannot forget that the Mexican census necessarily gets some color from the warm Southern imagination, and that, at best, two-thirds of these people have no wants, and are without the means to gratify them if they had them. So you must needs return a somewhat dubious answer to the eagerly urged question, Will it pay? and content yourself with that delightfully non-committal phrase of the country, which leaves all things to hope but nothing to promise, *Quien sabe?*

Epitome of Ancient, Mediæval, and Modern History. By Carl Ploetz. Translated, with extensive additions, by William H. Tillinghast. Boston: Houghton, Mifflin & Co.

PLOETZ'S "Auszug aus der Geschichte" has long been known to all persons familiar with German instruction in history as altogether the best book of its kind now in use. It is almost too much to say "of its kind," for its peculiar value comes from the fact that it is quite of its own kind. A manual of history means generally either a dictionary of dates, or else an attempt to present in narrative form a connected view of the world's progress. Each of these forms has its place, but neither is quite what the instructor in history wants to put into the hands of his pupils. The mere list of dates is meagre. The brief narrative wearies and disgusts, while at the same time it encourages the pupil in the delusion that the whole story is, or ought to be, there between its covers.

Dr. Ploetz, a practical teacher for many years, saw this difficulty, and met it by producing a book which should lie just between these two extremes. He based his attempt on the sound theory that no book can replace the living word of the teacher, but that this living instruction must be accompanied by some solid preparation on the pupil's part. His book contains, therefore, whatever seemed to him necessary as a basis for more detailed instruction. It is first a dictionary of dates, so arranged by the aid of different types as to throw out into prominence the more important ones, and to show the subordination of the rest to them. But it is also a very successful effort to suggest more than the date and event. It aims to group facts about races and territories so as to show their essential connection. It traces by a word and a hint here and there the most important lines of intellectual and religious development. In short, it tries to answer just the leading questions which an intelligent pupil would be sure to ask at the outset of his studies.

We have said that this book presents whatever seemed to Dr. Ploetz necessary as a basis for instruction. No two men could possibly agree on just what was necessary for this purpose, and it was therefore natural that a man of independent scholarship, undertaking to put Ploetz into an English dress, would find much to add and something to omit. This is just what Mr. Tillinghast has done. Excellent as the original is, we have no hesitation in saying that the translation is a great improvement upon it. It contains considerably over a third more matter, mainly in the history of England and America, which were notably deficient in the original. China, Japan, and India also have been granted a space commensurate with their importance as factors in modern civilization. These are the absolute additions. Other portions are marked by the translator as having been considerably enlarged or changed. But, besides all this, it is evident upon every page that the work of translation has been done in no slavish spirit. Accurate and faithful where the original seemed sufficient for the purpose, the version departs from the text constantly wherever new light has been attainable. Practically, therefore, this is Mr. Tillinghast's work, based upon the plan and the text of Dr. Ploetz. While it is on some accounts to be regretted that the convenient form of the German manual had to be sacrificed, it would be hard to say what parts of the new volume we should be willing to miss.

Considering the great typographical difficulties arising from the use of several kinds of type, the errors are wonderfully few and of no real injury to the book. The result is a really beautiful piece of workmanship, a work destined, we believe, to become indispensable to every student and every teacher of history. Coming closely upon the recent volume of essays upon historical methods edited by Dr. Hall, it seems to mark an epoch in historical instruction in America. The day of untrained teachers and of unscientific methods, in this as in other fields of knowledge, is passing, and the time has come when scientific training will be a universal demand both in higher and lower teaching of this long-neglected subject.

A word of commendation should be given for the fidelity to the plan of the work shown in the chapters on the recent history of England and the United States contributed by Dr. Edward Channing.

La Vie Publique en Angleterre. Par Philippe Daryl. Deuxième édition. Paris: J. Hetzel et Cie.; New York: F. W. Christern.

RECORDS of "impressions" are so abundant nowadays, that one takes up a new sample with a feeling of weary indifference. But the feeling soon disappears in the case of the present work. Anything more vivid and graphic than this Frenchman's pictures of English public life we have seldom taken in hand, and they are written in that crisp and animated style which makes the best French composition so attractive to read. The first chapter is a lively analysis of the difference between French and English current literature, especially novels. The author administers a very wholesome admonition to his countrymen, in pointing out that in England both writers and publishers aim at finding a place for their works on the open tables of all classes and ages, so that adults and young girls may frankly use the same material; and how much more valuable this practice is than, for the sake of mere artistic power (if it is such), to create a gulf between the two classes, and to make the older readers feel that their own pleasures must be carefully concealed from the younger if any purity of thought is to be preserved. We incline to the belief, or at any rate to the hope, that the greater freedom of the press under the Republic is gradually creating a reaction against the process which, extending through the two Empires and the Restoration, culminated in the filth of M. Zola. The chapters on the press will, we think, afford some new sensations, even to those who are most accustomed to the glorification of that mighty engine of modern civilization. Next follows the theatre, than which there is hardly any greater subject of contrast between England and France. M. Daryl is, however, much more complimentary than we should have expected to the English stage, and the fairness of the comparison makes it all the more interesting. "Philosophers and Poets" contains some graphic biographical sketches, but turns upon the idea that these classes, like other writers, aim to enter into the national spirit, to popularize their subjects, and to raise the general moral and intellectual tone of the people.

The second part treats of the Houses of Parliament, the elections, and the City of London. It is less entertaining and more historical, but in its sketches of individuals, notably of Bradlaugh and the Marquis of Hartington, maintains the full level. The author notes very acutely, in describing the Government leaders and the leader of the Opposition, that this is the particular in which constitutional government in Great Britain differs from any on the Continent, and, he might have added, in the United States. Instead of a "dictatorship of six hundred heads," or of anarchical factions pulling in every direction, Parliament is divided into two more or less well disciplined parties, following individual leaders whom they have chosen.

Part Third includes the Queen, the army and navy, and the courts. That the author does not seek to curry favor with the English is shown by the slight degree of reverence with which he treats her Majesty and, indeed, the House of Lords. This may come in part from the French spirit of democracy, but no doubt also from the Queen's deadly sin of "having a deep objection to French literature in all its branches." "The charming genius of France is a dead letter to this royal intelligence." M. Daryl's view of the British army is a good deal like that of the first Napoleon, that "the British infantry is the best in the world; luckily there is not much of it." A Frenchman would be likely to look with a more tolerant eye than a Russian upon the volunteers and the household troops, but both would conclude that the present military system of Great Britain mainly rests upon "the streak of silver sea."

Darwinism as Stated by Darwin Himself. Characteristic Passages from the Writings of Charles Darwin, Selected and Arranged by Nathan Sheppard. D. Appleton & Co. 1884. 8vo, pp. 357.

IT has been advertised that this volume has met with the approval of Mr. Darwin's family; it is also spoken of as by "Professor" Sheppard. But the selector's right to this title appears neither on the title-page nor in the character of the book; and we must think that "the approval of the family" is perhaps of as vague a nature The volume is very evidently not the work of a scientific man. It would seem that Mr. Sheppard (editor of 'The Dickens Reader,' 'Character Readings from George Eliot,' etc.), finding it impossible to make a 'Darwin Birthday Book' or even a 'Darwin Reader,' has contented himself with arranging "characteristic passages" in this less popular form for use at the fireside rather than in schools. The book is not worthless. It is at once, as Mr. Sheppard says, "authentic, brief, and inexpensive." It is not worthless, but it might easily be worth much more than it is; and Mr. Sheppard's assertion that "it cannot but be useful to those who are perfectly familiar with the writings of Darwin" has the least possible foundation. He adds that "it is designed especially for those who know little or nothing about his line of research and argument," and it is difficult to see how the same book can be of much value to both classes of readers. Its chief use, we think, will be among those who have read Darwin's books, but have not studied them, and do not own them. To such persons it will have the interest of any collection of long extracts.

As for its "special design," we should judge it, though unavowed, to be the recommending Darwinism to the "prejudiced"—the persuad-

ing them to swallow the salutary pill, presenting it as morality, and religion, and science, all mixed together and rolled into one. Mr. Sheppard speaks of "the fascination which will always be felt at the mention of [Darwin's] name," apparently conceiving "fascination" to be the emotion with which philosophic minds regard Aristotle or Sir Isaac Newton; and this "fascination" he seems to think will be increased by the perusal of a baker's dozen of short applauding judgments of "Darwin and his Theories from a Religious Point of View," which he prefixes to his volume—Darwin and his theories judged by the *Sunday-School Chronicle*, by President McCosh, by Canon Farrar!

Mr. Sheppard's part in the volume is strictly one of "arrangement." He has arranged Darwin's remarks on lines indicated by the titles and sub-titles of Darwin's books and chapters, but not by any means on precisely the lines on which Darwin himself marshalled them. And the result resembles what would be produced in an attempt to condense Gibbon by giving in alternate and repeated succession half his narrative of some battle, half his record of some legislation, and half his biography of some great man, the selections being intended (perhaps unconsciously) to demonstrate, not the course of history, but that the battle was necessary, the legislation wise, and the great man virtuous. Mr. Sheppard does not connect, even by an explanatory sentence, the passages he brings together. And with an accuracy which would be praiseworthy if it were not occasionally a little misleading, he retains even adverbs and conjunctions in their places. But he in this way sometimes forces a *thus*, or a *because*, or a *so* to perform a duty Mr. Darwin himself has not burdened it with, and slightly falsifies the truth of statement, to the regret of "those who are perfectly familiar with the writings of Darwin," and to the hindering of "those who know little or nothing about them."

Mr. Sheppard never, as we have just said, connects his chosen passages by an explanatory line, but he constantly breaks them by newspaper-like "headings," which, even when phrased in Darwin's own words, fail, for the most part, to define the subject neatly and delicately. His Table of Contents, therefore, has a singularly different tone from any in Mr. Darwin's volumes. We do not find in Mr. Darwin, for instance, "Letters retained in the spelling but useless in pronunciation," when it should be "Rudimentary organs may be compared to letters," etc. What is set forth by Mr. Sheppard in quotation marks (rightly) as "Characteristic Selfishness of Man," is entered by Mr. Darwin as "Attention paid by Savages to Ornament." Mr. Darwin's heading "Belief in God" flows from Mr. Sheppard's pen (still in literally correct quotation marks), "Ennobling Belief in God," and so throughout. But we lay down the book with a certain kindliness of regard, as we took it up with a certain hopefulness of interest; for if he is to be blessed who makes two blades of grass grow where there was but one before, he also may be thanked who, in any fashion, leads us to read again a page of Mr. Darwin's.

John Adams, the Statesman of the American Revolution. By Mellen Chamberlain. Boston: The Webster Historical Society. 1884.

MR. CHAMBERLAIN'S interesting monograph has two distinct claims to consideration. While it is a personal sketch of a somewhat familiar public character, it is at the same time a careful study of pre-Revolutionary tendencies, and gives especial prominence to the ecclesiastical issue as a leading cause of the Revolution. There is certainly nothing admirable in a certain type of historical investigation which aims merely to replace long-established theories with new ones. An accomplished living historian (Mr. James Gairdner, in his "Richard III.") has recently told his readers that he has become ashamed of his earlier efforts to prove "that traditional black was real historical white, or at worst a kind of gray." But Mr. Chamberlain's view of the pre-Revolutionary situation is much more than a "new view." Its basis may be found in the contemporary discussions of John Adams's own day; not merely in the sermons and letters of Jonathan Mayhew, Charles Chauncy, and Andrew Eliot, but in Samuel Adams's thoroughgoing letter of January 13, 1768, and John Adams's "Dissertation on the Canon and Feudal Law." Wherever the prevailing sentiment of the community was Puritan, it may well be believed that the conditions here described might very naturally exist. When, however, Mr. Chamberlain pronounces "ecclesiasticism a cause of the Revolution," he can hardly mean to indicate it as one which operated generally throughout the colonies. It was a far different set of conditions which gave rise to the Revolutionary movement in New York or in Pennsylvania; and different issues still are to be traced in the colonies further south. Even in Connecticut, where the ecclesiastical conditions were almost an exact reproduction of those in Massachusetts, the key to the situation is apparently not to be found in the fact that it was a Puritan community, but in the fact that, like the neighboring charter colony of Rhode Island, it was determined to maintain the privileges of local self-government guaranteed by its charter. On the other hand, the "apparent opposition to an American episcopate," which Mr. Chamberlain cites as existing in Virginia, is of uncommon interest when it is remembered that most of the Revolutionary leaders in that colony were connected with the Established Church.

The truth is, that no one theory is of itself sufficient to account for the Revolution. The substantial agreement and union which existed so early as 1776, and which made the Declaration of Independence possible in that year, are certainly remarkable, in view of the strikingly diverse conditions in which the Revolutionary movement had its springs, in the different colonies. We do not wholly share Mr. Chamberlain's strongly expressed conviction that there is so much "to unlearn" in studying the histories of this period. We would say, rather, that the partial views which too many of them present need to be supplemented by such discussions as shall exhibit in their just proportions other tendencies equally important. It can hardly be doubted that the American colonies have been too loosely regarded as uniform in their conditions and characteristics; it being assumed that the same set of theories and explanations will fit all alike. The study of these early political organizations as separate growths, with certain common tendencies, but with strongly marked individualism, has not been so common; though there are indications—and this very suggestive pamphlet is one of them—that the importance of such study is obtaining recognition.

BOOKS OF THE WEEK.

Beard, O. T. Bristling with Thorns. A Story of War and Reconstruction. Detroit News Co.
Brands, O. M. Lessons on the Human Body. Leach, Shewell & Sanborn.
Cheyne, Rev. T. K. Translation of the Book of Psalms. D. Appleton & Co. $1.25.
Collier, P. Sorghum: its Culture and Manufacture Economically Considered. Cincinnati: Robert Clarke & Co. $3.
Cornell, A. B. Biography of Ezra Cornell, Founder of Cornell University. A. S. Barnes & Co.
Dyer, Prof. Louis. The Greek Question and Answer. Boston: J. R. Osgood & Co.
Lamb, Mrs. Martha J. Wall Street in History. Funk & Wagnalls. $2.
Stretton, Hesba. Carola. Dodd, Mead & Co. $1.25.
Roe, E. P. The Opening of a Chestnut Burr. Illustrated. Dodd, Mead & Co. 25 cents.
Smith, Rev. H. B. System of Christian Theology. Edited by Wm. S. Karr, D.D. A. C. Armstrong & Son.
Todd, Lieut. A. The Campaigns of the Rebellion. Manhattan, Kan.: State Agricultural College.
Wilkinson, W. C. The Dance of Modern Society. Funk & Wagnalls. 60 cents.
White, T. E. The Lakeside Musings. Originally published in the Chicago *Tribune*. Chicago: Rand, McNally & Co. $1.50.

Zöckler, Prof. O. Handbuch der theologischen Wissenschaften. Fifth half-volume. Nördlingen: C. H. Beck'schen Buchhandlung.

Fine Arts.

THE ACADEMY EXHIBITION.—I.

THE dominant impression which the exhibition of the Academy leaves us, after a careful review of the 700 pictures exposed, is one of executive feebleness largely varied by sketchiness—or, rather, insufficiency of execution due to want of knowledge of nature—with here and there a noteworthy exception of faithful study and solid execution, but so few as hardly to modify the impression that it is an exhibition of the work of amateurs. An affectation of cleverness is too generally apparent, a most unmistakable indication that the body of the exhibitors care more to be thought experter than they really are, than to be sincere in their method or thorough in their results. It would be hard to find half a dozen pictures which bear evidence of exhaustive study of their subject—of a resolute attempt to know completely the material of which the picture is composed. Of the so-called pre-Raphaelite work there is nothing, and there is no need of anything, for the sole advantage of that intense investigation of nature's facts is as study, for the training of hand and thorough acquaintance with the parts of the subject-matter which enable the artist to express himself with facility and thoroughness. That none of this concentration and uncompromising struggle with nature and determination to get to the extreme limit of fidelity should be found in the younger men, is a discouraging symptom of our future art progress. The extreme realism in painting is not an end of art; but as matter of training, both for certainty of hand and complete knowledge of the material of which pictures are to be made, there is no evading it; and the young painter who cannot bring himself to it as matter of discipline and education will never go beyond the merely clever, the legerdemain of art, for which the French have coined the convenient word *chic*. The painter who is satisfied to work for *chic* may be left to flounder as he may; there is no real greatness in him or good work to be hoped for from him. All the great schools and all the great painters have begun in this absolute devotion to the faithful representation of their material, and with the most entire absence of any pretension to display of their own cleverness. Even Rubens, who can in no wise be considered a purist, began in a vein of elaborate rendering of detail which may be recommended even to American genius. To be clever or great is given a man; to be conscientious in training, sincere in study of the means of expression, which is the only way of fully developing the greatness, depends on the artist's will—on himself.

The only absolutely uncompromising study of nature, so far as we have yet observed in the exhibition, with exception of certain studies of still life, is the "Summer in France" of Henry P. Smith, No. 119, which the Hanging Committee has put where it can hardly be seen or studied. The color of Mr. Smith's picture is

faithful in a most remarkable degree; it is an absolutely honest record of the scene, and such a study as no man can make without getting better insight into nature and a firmer hand to follow her. The sea piece of Mr. Richards, No. 79, shows the advantage of the artist's long and faithful study of nature. Rarely have we seen so complete and accurate rendering of the particular phase of agitated sea as this: the habitual, every-day mood of the elements, with nothing dramatic or sensational—the waves coming in from the open, breaking on, and recoiling from, an iron-bound coast, the foam drawing out in the fine lines of the sea's spinning, the pale and uncertain green of the ocean woven in with foam and reflection of sky and rock and cloud—and all rendered without laboriousness, but free and rapid as the record of the unstable and uncertain element must be. But this freedom and this subtle truth could never be united without earlier labored and thorough study of the subtlest forms of water. The distance of Mr. Richards's picture is full of seaside poetry—the sunlight melting away the morning mists; and the massive distant cliffs, made huger and more imposing by the uncertainty of the fog, with the receding sea, so well and so consistently told. If we were to except to any part, it would not be on the score of fidelity, but of effectiveness—that the nearer rock masses are too much broken up—their fractures mar the breadth of the whole and the solemnity of the picture. A little unobtrusive study from nature, No. 302, by Frank Anderson, is the only other landscape work which we can find in the entire exhibition that attacks nature in the uncompromising, devoted spirit which seems to us so recommendable; and, if the work of a beginner, as it would seem to be, it is worthy of high praise not only for its sincerity and careful rendering of detail, but for the genuine feeling for color it shows. It is somewhat weak and uncertain in the extreme distance, which is a common defect of inexperience in studies of this kind, and which will work out.

In No. 686, "Woodland Brook," etc., by W. B. Baker, as in Mr. Richards's work, we recognize the riper result of the faithful study of nature, in the freedom and largeness of execution with which the detail is painted, the ready and rapid touch with which the foreground objects are given without in any way losing in quality of color. The intricacy of the shrunken stream finding its multitudinous channels among the stones and sedge of its autumn bed, the local color and character of the boulders which block its flow, the fallen leaves, and the broken material of a forest foreground, are all sufficiently well painted, and with a sure and ready hand, which can only have been made so by most careful study gone through in earlier years. The upper part of the picture, the foliage of the trees, and the glimpses of sky, showing through the tree tops, are unfortunately not in keeping with the spirit of the picture, and detract seriously from the *ensemble*. It is not that they are slightly painted in order to be less obtrusive, but that they are carelessly studied, and indifferently painted as a consequence, owing to want of knowledge or want of care for the completeness of the work, which, in either case, is a grave fault. The man who does not care for the completeness of his work cannot expect the public to care more for the work itself.

There is a treatment of detail which, in realistic work, is nobler than either the painstaking exactitude of Mr. Smith's art or the readier if not less faithful rendering of Messrs. Richards and Baker, namely, the suggestive method of masters like Bastien Le Page, and this seems to have been the aim of some of the exhibitors in the Academy, notably of Mr. Hovenden in No. 117, and of Mr. Bolton Jones in No. 128, works in which accident and the palette knife appear to play important rôles. In a great master like Le Page, where training has attained its highest results, this quality of suggestion of detail by apparently insufficient and very broad execution is the result of a profound knowledge of minute facts and an almost incomprehensible certainty and rapidity of hand, acquired in the only certain way—by severe and precise study of detail from nature. To hope to reach it by sheer accident, as Mr. Hovenden appears to have sought it laboriously, and Mr. Jones with more breadth, but hardly more completeness, is to deliver one's self to a will-o'-the-wisp. No good execution can be got at by any such means, and the successes of accident are sheer delusion—deception at the moment and paralysis in the future—to him who gives himself to their pursuit. A great master *may* do with a spatula, or with his thumb, if he will, more quickly and easily what he would otherwise have done with the brush; but until he can do it with the brush he cannot do it otherwise, and the effort of feebler men to catch in this way what they cannot render by simple and straightforward brush-work, is a pure waste of life. Mr. Jones is able to do with his pencil better work than is in this picture, and he ought to feel that it is not worth his while to sacrifice the genuine qualities of his pictures to the empty display of mere dexterity, which has no value whatever in the eyes of true taste. What men want is that a thing should be well done, and after that it is of minor importance how or how quickly it was done.

Mr. Smillie, in Nos. 214 and 174, in another way treats nature with the contempt that is not bred of familiarity. He mistakes largeness of treatment for want of detail, and his pictures, with certain fine qualities of color and general effect, are simply the beginning of what pictures of this class ought to be, the first stage of development, and by no means either finished pictures or motives of such value that they can dispense with finish. There are now and then landscape painters whose art is such that we overlook willingly the absence of truth to detail in the brilliancy of their motive or fervor of their imaginative powers; but from the landscape painter pure and simple, without imagination or deep poetic feeling, we ought to demand complete sincerity and as minute record of truth as he is capable of giving, and this is more than either of the Smillies gives us. They both can do better work and have done it.

Mr. McEntee redeems in part a careless and too conventional style of treatment of the detail of his pictures by a solemnity of feeling and breadth of effect which are not common among our landscape painters, and more suggestiveness in the treatment of his twilight effects. But in the large autumn landscape, No. 65, what justification is there for painting the foliage, admirable in general color, as if it were of some solid substance, through which no bird could ever fly, devoid of that quality which is the *sine qua non* of good foliage painting—openness, leafiness?

The laborious Sonntag again, while he follows the details of his landscape with patience, has grown conventional in touch; and stone, stick, and branch come pretty much the same to his brush. His arrangements are broad, but marred by the persistent glitter of his touch—too much sparkle, and sparkle not always in place.

HENRY HOLT & CO., N.Y.,

HAVE JUST READY:

Stratford-by-the-Sea.

A Novel. 16mo (*American Novel Series, No.* 4), $1.00.

Called Back.

By Hugh Conway. 16mo. Leisure Hour Series, $1.00; Leisure Moment Series, 25 cents.

The Pagans.

A Novel. By Arlo Bates. 16mo (*American Novel Series, No.* 3), $1.00.

A Latter-Day Saint.

Being the Story of the Conversion of Ethel Jones, related by Herself. 16mo (*American Novel Series*), $1.00.

WE WILL FURNISH A SAMPLE Case (12 quart bottles, no two alike), pure California Wine, price $5. SONOMA WINE AND BRANDY CO., 30 Warren Street, New York.

The Nation.

NEW YORK, THURSDAY, APRIL 24, 1884.

The Week.

THE passionate desire of the Democrats for civil-service reform came out on Monday in the vote on the bill to abolish the four years' limit to the tenure of certain Federal offices. The majority for rejecting the unanimous report of the Committee in its favor was 141 to 99, of which only 27 were Republicans. The debate seems to have caused the wildest excitement among the Democrats, whose one strong political feeling seems to be hostility to any interference with the spoils system. On every other prominent question of the day they are lukewarm or indifferent. The only use of the four years' tenure is to furnish the Administration with a chance to give the office to a new man without having to give any reason for dismissing the old one. It also enables the office-jobbers to know for certain when there will be a vacancy, so that they can come to Washington and exert the "pressure" at the right time. It was condemned when enacted in 1820 by nearly every prominent man of the day of both parties, and has produced every one of the evils then predicted as likely to result from it.

State Conventions were held on April 16 in Pennsylvania and Illinois and three Southern States to appoint delegates to the National Republican Convention. The striking feature in the two Northern conventions was the perfunctory manner in which the one instructed its delegates to vote for Blaine and the other for Logan. It is very easy to see whether a body of this sort is heartily in favor of the thing it is set about to do, or whether it is merely registering a decree *pro forma*. In both cases the instructions were carried without opposition. In neither was there any forcible expression of confidence in the result. In Pennsylvania the "regulars" of the Cameron Machine had a majority of the delegates, as was proved by the only test vote which was taken. They defeated the Blaine men in the only important division that was had, by substituting the minority for the majority report on the Pittsburgh contested seats. The highest vote cast for delegate-at-large to the Chicago Convention was cast for James McManes, who has been under suspicion by the Blaine men from the beginning, and who defied the instructions of the State Convention at Chicago four years ago. It is apparent to the practised eye of the politician that beneath the instructions there was an array of hostility and an assemblage of doubt, and a looking forward to some other outcome than the nomination of Mr. Blaine at Chicago; all of which bodes no good to the "Plumed Knight." In the Illinois Convention the proceedings were similarly cut and dried. The only real outburst of enthusiasm was called up by the nomination of General Oglesby for Governor. This rugged veteran deserved all the applause he received. He had been cruelly treated by the party when he was set aside some years ago in favor of Logan as a candidate for re-election to the Senate. He is not, like Logan, an adept in the arts of the politician. He does not know how to use "patronage." The political machine is rather a bore to him. He is one of the sterling characters of the war and the anti-slavery movement, originally a Henry Clay Whig, a companion and follower of Lincoln, a passionate and rough debater on the stump, single-minded and "big-hearted." He is now well advanced in years, but there is a good deal of work left in him. That he will be elected by a sufficient majority there can be scarcely a doubt.

Conventions were held also in Alabama, South Carolina, and Tennessee. All were controlled by Federal office-holders, and all chose delegates in favor of Arthur. Such walking-machines, of course, carry no momentum. They bring numbers but not strength to the candidate for whom they cast their votes. It is customary for them to make valiant promises of victory if their candidate is nominated, but everybody knows it is not victory they are counting on in Alabama and Tennessee, but post-offices and collectorships and clerkships. Flanigan, of Texas, gave voice to the whole Southern mass at the last Convention when he exclaimed: "What are we here for, if not for the offices?" This guileless confession of faith was received with shouts of laughter from the galleries and the Northern delegates, and has finally passed into history. The Southern delegates who are ticketed to Chicago for Arthur are Flanigan men. Looking at the proceedings of the five conventions held on Wednesday week, we can see no evidence leading to the belief that either Blaine, Logan, or Arthur will receive the Chicago nomination. There is no heartiness in the support extended to either of them which is the presage of victory. If Mr. Blaine's character were unsullied, he would probably go to the Convention with a majority at his back, but if he has less than a majority in the beginning, he will have neither reserves nor recruits, and will soon fall out of sight. Those who are against Blaine know why they are against him. They are not open to persuasion. They are against him first, last, and all the time.

Mr. Blaine's "literary bureau" is kept very busy now, explaining that all developments which seem to show that his boom is on the wane are really signs that it is making progress. Several very ingenious bulletins of this sort were published on Monday by way of Washington. The statement having been sent abroad that the Iowa delegation would not be instructed for Blaine this year as it was in 1880, the hasty inference was drawn that there was a falling off in Blaine's strength in that State. How erroneous this view is, is shown by a "prominent Iowa man" whose explanation the bureau has obtained. He says it is true that the delegation will not be instructed, but it will be solidly for Blaine, and the omission of instructions will be due entirely to a growing "tendency to proceed carefully and with deliberation this year." As a matter of fact Blaine's strength in the State "has not been declining—if anything it has grown." The same thing is true of Kansas. All the Republicans there are for Blaine, and his nomination would be certain to make it the "banner Republican State," but it is thought to be wise policy to have no instructions this year. Some particularly irritating information about the falling off of Blaine enthusiasm in the historian's "home" has been published in the Boston newspapers recently, and this is thoroughly disposed of by a "member of the delegation" from Maine, who says: "Blaine is just as strong in Maine now as ever he was; if anything, he is stronger." In New Hampshire and Massachusetts, the "rank and file of the party is strongly in his favor," so that New England is practically solid for him. The real truth about the boom, therefore, as disclosed in these official bulletins, is that it has reached so high a state of development that its promoters are afraid to allow it to show its full strength. Wherever Blaine instructions are given it is to be understood that the Blaine sentiment is so strong that all efforts to restrain it have proved unavailing. Wherever Blaine instructions are not given, it is to be understood that they are withheld because the sentiment of the State is so unanimous for Blaine that instructions are unnecessary.

We are at a loss to understand the bitter and determined hostility of the *Times* to President Arthur and his political aspirations. For days and weeks its columns have bristled with headlines and paragraphs implying that to be "against Arthur" is the very summit and ideal of political merit. Nothing can be found in Mr. Arthur's Administration to justify such unreasoning rancor. The *Times* may think, as we do, that there are better candidates in the field, and that the nomination of Mr. Arthur would involve some risks to the party that might better be avoided. But if there are better candidates in the field, there are also much worse ones. If the nomination of Arthur would involve some risks, that of Blaine or Logan would involve far greater ones. The *Times* has, indeed, taken care to show that it is opposed to all three, but its tone implies that it deems Arthur the least desirable of all, whereas he is much to be preferred to either of his leading competitors. His Administration has been discreet, conservative, and cleanly. It will not suffer by comparison with any of its predecessors since Lincoln's. Indeed, it is above the average of *post-bellum* administrations in point of respectability. This fact cannot be rooted out of the public mind by newspaper asperities.

Secretary Folger's letter to Collector Duval, who tried to become a martyr by going out of office on the pretence that he was expected to support the President's candidacy against his honest convictions, is said by Mr. Blaine's friends to have given great comfort to the office-holders at the South, whose natural inclination is to support him, but who have hitherto

been afraid that if they did so it would cost them their places. Mr. Folger ought, however, to have put one thing more in his letter which would have, perhaps, destroyed their peace: he ought to have added that office-holders would not be allowed to abandon their work next June, and go off in swarms to attend political conventions. No private employer would permit the exodus among his clerks which will take place among the Government officials at the South this summer. All the prominent ones are going to Chicago to "shout" for somebody. They ought to be kept at home at their work. In any State in which the Republican party is so small that there is nobody to represent it at the Convention but office-holders, it will not hurt it to go unrepresented. In fact, the office-holders never go to a convention without hurting it greatly, because their business at conventions is, in the strictest sense of the term, private business.

The retirement of Mr. John Jay Knox from the office of Comptroller of the Currency is a loss to the public service of no common kind. The intelligence which he has brought to the complicated duties of his office has never been surpassed in any similar station, and has not been equalled in the particular station which he has so long filled. The national-banking system owes much of its present carefulness in detail management to his mastery of all the facts and principles of sound finance. His annual reports embrace perhaps the most complete and satisfactory arrangement of information needful to the business man, the student, and the legislator that has ever been furnished in this country on any economical subject. Mr. Knox resigns the Comptrollership to take the presidency of the National Bank of the Republic in this city.

The anti-Hungarian agitation in the Pennsylvania coal regions threatens now to produce a riot. The respectable portion of the community are said to be opposed to violence, but are also opposed to the Hungarians on sanitary grounds, fearing that the filthy habits which they have brought with them from Europe will produce a pestilence when the hot weather begins. They are therefore said to be secretly agitating for a mob in the interest of hygiene. The coal companies, on the other hand, in whose employ the filthy Hungarians are, declare that they will "treat all alike"—which means, we suppose, that they will call in the police and the troops, no matter who makes a disturbance. The curious belief in the efficacy of a mob to cure any social trouble seems to be in some parts of the country a marked feature of the day. In Cincinnati it was resorted to to effect an improvement in the jury system, and the Pennsylvanians seem to think that it will answer the purpose of a board of health. The fact is, that, as an instrument of government, a mob can be used for any purpose and at any time and place. The Hungarians have had their warning, and they have made no real effort to become clean.

It cannot be alleged that the Hungarians are heathens, or dark-colored, or do not come here to remain. What is charged against them is that they work for low wages, and live in a squalid and filthy manner. How this difficulty is to be got over it is hard to see. There is no standard of living which can be called American, and which a man can be compelled to adopt in order to entitle him to a residence in this country. Nor would it be possible to prescribe such a standard by legislation. All the newest comers have excited reprobation among the older ones on this score, except the first white settlers, who always lived better than their forerunners, the Indians. But the Irish have always been much complained of, and the Germans to some extent, by the native Americans, for not dressing better, and not keeping their houses in better order, and not having nicer "table manners." No one has hitherto thought of reforming these things by violence. The Hungarians, however, though probably not real Magyars, but Slovacks, or Wallachs, will probably defend the right to be dirty, like men. It is an ancient and inalienable right. No man can forfeit it except by becoming an inmate of a jail under a judicial proceeding. In that case he may lawfully be forcibly washed and compelled to put on clean clothing.

Great sympathy will be felt in many quarters for Mr. John J. Corneilson, a leading lawyer of Mt. Sterling, Ky., who had to cowhide Judge Reid of the Superior Court of that place, on Wednesday week, on account of a decision of the Court in which Mr. Corneilson's conduct of a case was severely reprehended. Judge Reid, before receiving his chastisement, pointed out to Mr. Corneilson that he had taken no part in the hearing or the judgment, and was absent when the decision was delivered; but Mr. Corneilson was in possession of "convincing and almost conclusive evidence that Judge Reid had been a traitor to his interests in the case named, and on the sly was doing all he could to slander him (Corneilson) to the other members of the Court." He accordingly caned him severely. The duty was made all the more painful by the fact that Judge Reid is an elder in Mr. Corneilson's church, and that it is hardly likely that Judge Reid will now be able to hold up his head in the community without murdering or trying to murder Mr. Corneilson. It is not long since a dissatisfied suitor, Buford by name, had to murder a judge of the Kentucky Court of Appeals, which shows that the bench of that State is really in great need of purification.

The dulness of the money market the past week was broken for an instant by a drop in sterling exchange below the gold-exporting point. Notwithstanding this, upwards of $2,500,000 which had already been taken for shipment was sent, the gold exports for the week being more than $5,000,000. The cause of the decline in sterling is attributed to a resumption of grain shipments. These have been small as compared with former years, but they show a considerable gain upon previous weeks of the present year. It is thus made to appear that there is still a market in which we can sell our surplus if we will accept the market price. This is no small encouragement, since it seemed at one time as though there were no bottom, the downward movement at Liverpool keeping even pace with that of Chicago. Another fact of the first importance is that the area of spring wheat sown this year will be larger than that of last year instead of smaller. This is made clear by the reports gathered from all parts of the spring-wheat territory by the Chicago *Tribune*. This state of things, so contrary to general anticipation, is explained in part by the large immigration to Dakota, where spring wheat is an indispensable crop, and in part by the fact that the farmers received high prices for their last year's crop, the bulk of the loss falling upon speculators. The price of wheat advanced nearly 3 cents at Chicago during the week, and that of corn 3¼. General trade shows no change, although the advance in raw cotton holds the market for cotton goods steady.

The stock market during the week has been unsettled by a simultaneous decline in all the Gould properties. Wabash, preferred and common, fell three points in one day, and recovered nothing. They declined again the following day. The sales were small, and there was no perceptible short selling. Missouri Pacific fell even more heavily, and Western Union touched the lowest price it has seen since the panic of 1873. The impression on the street is that Mr. Gould has got tired of holding the market up, and is unloading regardless of consequences. The Vanderbilt properties have been well sustained, and the Northern Pacifics have shown a slight advance in both stock and bond issues in consequence of large earnings for the first half of April. The earnings of other Northwestern railroads are satisfactory. Union Pacific, on the other hand, continues to show a serious loss as compared with former years, and the price of its stock has fallen below 67. This, for a property paying 7 per cent. dividend, seems very low. It betokens, of course, an apprehension on the part of investors that the competitive forces at work in the far West are too strong and too persistent to be soothed or overcome. The situation of the Trunk Line Pool is unchanged, and we hear no more of the "clearing-house plan" for the maintenance of rates, although it is understood that the project is still under consideration. The coal roads, which have held their own remarkably during the long and severe shrinkage on the Stock Exchange, have begun to feel the effects of the depression of the iron trade. Lackawanna declined two points, but is still nearly ten points higher than it was at the close of 1883. Reading fell off nearly four points, the agreement to restrict production having had no effect on the market either for coal or for stocks.

The appearance of Mr. A. Oakey Hall as a municipal reformer in London, warning the British against the proposed elaborate change in the government of London, is certainly one of the strangest incidents of a strange period. The despatch only gives a very meagre account of his objections to Sir William Harcourt's new bill, but they seem to be all included in the term centralization, to which his remembrance of the Tweed Ring, of which he was a member, makes him unalterably opposed. There are several things, however, which prevent his experience being

valuable for Londoners. One is, that there is not and will not be universal suffrage in London. Nobody but people who pay the direct tax known as poor-rate will vote. Another is, that the tradition that only men of education and good social standing are fit for office still has a strong hold on the English mind among all classes, and is likely to continue to have it till the constitution of English society has been greatly changed. A third is, that there is no Irish population in London, as there is in New York, accustomed to act blindly under a leader, and large enough to give a majority or nearly a majority at the polls. The production of a Kelly in London is impossible at present. In fact, we do not know yet what kind of person the English demagogue will be, or how he will be created. Neither the ancient demagogue Cleon, nor his modern counterpart, the ignorant humbug and blatherskite of which we have several specimens on this side of the water, has yet appeared in England. The men whom the Tories denounce as demagogues, such as Gladstone and Chamberlain, would be considered in New York too superfine and conservative for daily use.

The London parish vestries, which did a good deal of the municipal administration, and which the present bill sweeps out of existence, came nearer in their composition to our Board of Aldermen than anything yet witnessed in England since the abolition of the old municipal corporations in 1832; but we do not believe the liquor interest ever figured prominently in them, though it is in England a very powerful interest in politics, and counts for a good deal at a general election. It has not as yet, however, summoned courage to put its grogshopkeepers into office. The great brewers make a considerable figure in political and social life, and in Ireland have contributed one member to the peerage; but the retail dealer still lives modestly in the background.

It will not do to swallow all the news about the doings and plans of the Irish dynamiters, because their object is to excite alarm and uneasiness in England, and if they can do this by circulars, and proclamations, and rumors in the newspapers, it is, of course, much cheaper and safer than doing it by explosions. Patrick Joyce's manifesto is, doubtless, intended to take the place of a small explosion. But at the same time the probabilities seem undoubtedly strong that the Irish dynamiters have joined forces with the heterogeneous crowd of Continental malcontents, and have secured their aid in the construction of infernal machines. If the subject were not so horrible, there would be something comic in the discovery that the supplies of dynamite of late used by the Irish in England were procured from France, while the London press were calling for a change in the American law as the sole mode of cutting these supplies off. That Irish aid will be very valuable to the Continental conspirators there is little doubt, because probably no malcontents in the world are now as well off in money matters as the Irish. No others have as thriving a population as the Irish-Americans are to draw on for funds. The Russian Nihilists and the French and German Socialists are for the most part wretchedly poor, and are deserted by such of their associates as manage to reach prosperity in this country. The Irish hatred of England, however, is one of the anti-social passions on which worldly success seems to produce but little effect.

The news about the English dynamiters is getting to be nearly as confusing as the news from the Sudan. It is now said that the police have been unable to trace any connection between the French dynamiters and the late outrages or attempts at outrage in England. Moreover, it is denied that any dynamite factory has been discovered in the north of France. It will probably soon be denied that anybody takes small cakes of dynamite over to England sewed up in the lining of his clothes. The trial of the men lately arrested is said to promise "startling revelations." Several prominent Irishmen in France have been interviewed, and all but one condemn the dynamite policy *in toto*. The Dublin *United Irishman*, too, asks very reasonably why, in talking of the connection of the Irish-Americans with these things, no attention is paid to the fact that the most prominent and widely circulated Irish newspapers in this country give no countenance to the dynamite policy at all, and that the bulk of the Irish-Americans have probably no connection with it. The reasons are probably three in number. One is, that when you wish to discredit a community, it is always wise to single out its worst members as specimens of the whole. Another is, that the dynamite papers make a show in money subscriptions which greatly impresses the imagination, and affords good grounds for the belief that they must have very powerful numerical support. The third is, that Irish disapproval of the dynamiters, like Irish disapproval of the assassins, is apt to be very faint, if expressed at all.

Both the *Pall Mall Gazette* and Mr. Labouchere, in his amusing character of *Truth*, have made defences of the practice of publishing tittle-tattle, apropos of the "trouble" into which Mr. Edmund Yates has got himself. The *Pall Mall Gazette* says that Lord Coleridge himself, in spite of the severity with which he reprobated the practice in passing sentence on Yates, is in society a brilliant retailer of personal gossip, and has brought back from America a good many of the sort of stories about men and women which make the society journals attractive. There is no denying, too, that the talk of most people in society consists of gossip about persons, and that to a large proportion of those who have anything that can be called social life, personalities are the most interesting topic of conversation, and that any circle from which a heroic effort is made to exclude them, is apt to become very dull. But these defenders of newspaper tittle-tattle overlook the fact that in this, as in many other things, much depends on the degree to which it is carried. Gossip, like scores of other human amusements, becomes harmful by excess, and the objection to newspaper gossip is that it is nearly always excessive. Every man knows that his personal peculiarities, his looks, his character, his ability, his fortune, his tastes and surroundings are a frequent topic of chit-chat among his friends and acquaintances—that is, among the people whose houses he frequents, or who frequent his, or whom he meets at the houses of others of the same circle. These, however, do not number probably, in the case of the most sociable, or popular, or best known men, over 500 all told, and what they say about him he hardly ever hears. Most of what is said it would probably pain him to hear, either as being wounding to his self-love, or as indicating that more was known of his private affairs than he would like to have known.

When this tittle-tattle finds its way into print, however, it undergoes a very serious change. From being the gossip of a few score, it becomes the gossip of many thousands or millions. It deprives the victim of all refuge. It makes not only his wife and children, but the servants in his own house, participants in the joke or story against him, and follows him with ridicule or discredit to all hotels, watering-places, and steamboats in the civilized world. All this is of course still more cruelly true when the victim is a woman. Personal gossip has undoubtedly been from the earliest ages the chief amusement of mankind, and will probably continue to be so as long as humanity is the chief interest of human beings; but as long as it had to be spread by word of mouth it was comparatively harmless. The society newspapers have undertaken to erect factories in which gossip is prepared for the market and spread by steam machinery. Of course a great deal of the gossip turned out in this way is harmless, but any of it that is harmful is terribly harmful. The editorial oversights and mistakes, even if few in number, deal deadly wounds. To many people, too, even what an editor thinks a kindly "notice," with which any man or woman ought to be pleased, is undiluted pain, for there are some even yet to whom publicity of any kind is a simple calamity. They are probably becoming scarcer as the years go by, but they still linger among us in considerable numbers. Society editors find it hard to understand them, or sympathize with them, but they are none the less God's creatures, and are entitled to humane consideration.

General Gordon's account of his situation is at once pathetic and comic. He is in no particular danger. He has provisions for five months, and is only hemmed in by "500 determined and 2,000 ragtag Arabs." Five hundred men, however determined, cannot take the place or surround it, and the ragtag men can only capture couriers, and probably have no fire-arms. Moreover, the rising of the Nile next month will force them all to withdraw to a greater distance from the town, and make better navigation on the river. But he sorely wants a few men who can fight. He would take two or three thousand Turks if he cannot do better. In default of these he would like a million dollars, and invites American and British capitalists to subscribe. Here is a chance which ought to make the teeth of dealers in "futures" water. A Sudan loan is probably the finest chance they ever got, because there is more "future" in it than in all the pork and corn and cotton in the United States.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, April 16, to TUESDAY, April 22, 1884, inclusive.]

DOMESTIC.

THE United States Senate on Monday passed the Bankruptcy Bill by a vote of 32 to 15. The House, by a vote of 175 to 44, passed a bill creating a Bureau of Navigation to look after American commerce. The bill to remove the four years' limit to the terms of such Federal office-holders as postmasters, collectors, district attorneys, etc., was voted against by 114 Democrats and 27 Republicans, receiving 47 less than a majority.

The Senate on Friday, before passing the Post-office Appropriation Bill, increased it by $3,499,500, making the whole amount almost equal to fifty millions, the amount asked for by the Post-office Department for the year ending June, 1885. This includes an increase of $300,000 for the railway post-office clerks and large sums for mail transportation.

The House Committee on Appropriations on Monday decided to non-concur in the Senate amendments to the Naval and Post-office Appropriation Bills, whereby the aggregate sum was much increased.

The House bill increasing the pension list was passed on Monday, ayes 165, nays 57. It includes "every person specified in the several classes enumerated in the pension laws of the United States, who served in the field in the military or naval service in any war in which the United States has been engaged for a period of three months or more, and has an honorable discharge, and is not receiving a pension or a greater pension than that provided for herein, but who, by reason of any wound, injury, or disease which there is probable cause to believe originated in said service in line of duty, and not the result of his own misconduct or bad habits, or other known cause occurring since such service, is now disabled, in whole or in part, for procuring his subsistence by manual labor." On Tuesday there was a debate on the Tariff Bill. The House has decided to hold evening sessions hereafter, for debating that measure.

The House of Representatives on Saturday passed a bill establishing a Bureau of Labor Statistics, with a commissioner at its head. It is a scheme on the part of the Democrats to catch the labor vote.

The House Committee on Coinage, Weights, and Measures on Wednesday unanimously agreed to report favorably the Lacey bill to prohibit the issue of Treasury notes of less than $5, and to provide for the issue of one, two, and five-dollar silver certificates. The provision of the original bill providing for the suspension of the coinage of the standard silver dollar when the amount of those dollars in the Treasury exceeds $20,000,000 (not held for redemption of silver certificates of the denominations of one and two dollars) was stricken out.

The House Committee on Ways and Means on Monday authorized Mr. Hurd to ask the House to suspend the rules and pass a bill reducing the duty on works of art to 10 per cent.

At a meeting of the Senate Committee on Privileges and Elections on Monday it was decided to close the Copiah and Danville investigations.

Attorney-General Brewster on Thursday sent to the Senate a report on the compensation of the Government counsel in the Star-route cases. He does not think the amount they received was excessive. He says: "These prosecutions have not been without their usefulness either. I have been informed by the Post-office officials that they have saved the Government in that department alone $2,000,000 per annum."

President Arthur has referred to the Senate the question of the removal of Collector F. N. Wicker, of Key West, Fla., for alleged collusion with Aguero's band of Cuban filibusters, which recently sailed from Key West.

The Secretary of the Treasury and the Attorney-General have issued orders to their agents in the cities bordering on the Gulf of Mexico to keep a sharp lookout for Cuban insurgents, and to intercept any filibustering expedition bound for Cuba.

The Department of Justice at Washington has made an arrangement with John A. Walsh by which he will go to Washington to testify in regard to Kellogg in the Star-route cases. The case will be called on April 29, when Walsh will testify.

The Pennsylvania Republican State Convention met at Harrisburg on Wednesday. Galusha A. Grow was chosen permanent Chairman. The Committee on Resolutions was instructed by a vote of 200 to 37, before leaving the hall, to bring in a resolution naming James G. Blaine for President and Robert T. Lincoln for Vice-President. A platform was adopted with the usual high-tariff plank. It also recommends suspension of the standard silver-dollar coinage and the retirement of the trade dollar, endorses President Arthur's administration, mildly commends civil-service reform, and favors James G. Blaine for President, and Robert T. Lincoln for Vice-President. A test vote on the admission of certain delegates showed that the old Machine, under the leadership of Quay and Magee, was still in the ascendant, the vote being 128 to 117. Six delegates-at-large to the National Convention were elected. Although instructed to vote for Blaine, their personal sentiments are not strongly in his favor. Gen. E. S. Osborne was nominated for Congressman-at-Large.

The Alabama Republican State Convention elected twenty delegates to Chicago on Wednesday, nineteen of whom will vote for Arthur on the first ballot. The Illinois Republican State Convention nominated Richard J. Oglesby for Governor by acclamation. The delegates-at-large to the National Convention are instructed for Logan.

The Indiana Republican Convention on Thursday elected four delegates-at-large to Chicago. They favor Edmunds, Harrison, and Gresham. Delaware elected five Blaine and one Arthur delegate. Of the Tennessee Republican delegates eighteen are said to be for Arthur, four for Blaine, and one for Logan.

At the New Jersey Republican Convention on Thursday a strong anti-Blaine sentiment was developed. Of the four delegates-at-large, Phelps is for Blaine, Ford for Edmunds, Sewell and Gardner "for the best man." The platform contains a strong civil-service reform plank.

The South Carolina Republican Convention on Wednesday selected delegates to the National Convention. Most of them are negroes and uninstructed. President Arthur's Administration was endorsed.

Tilden delegates were elected on Thursday by the West Virginia Democratic Convention.

The conventions in this city called to elect Congressional district delegates to the Republican National Convention were held Saturday night. Fifteen of the sixteen delegates chosen are nominally in favor of President Arthur's nomination.

The General Street Railway Bill was passed by the Assembly at Albany on Thursday by a vote of 79 to 45, after one of the most disgraceful lobby scenes that have been known in a decade. The agents of the rival cable and surface roads were present in force, and shameless in their solicitations. They were driven from the Assembly Chamber by order of the House, but plied their trade near by. Before the final passage of the bill several amendments were adopted removing certain objectionable features. At Albany on Tuesday, the Senate concurred in the Assembly amendments, and finally passed the bill.

Sheriff Davidson, of this city, was acquitted, on Thursday, of the charges of extortion and grand larceny. The Sheriff announces that, so far as it is in his power, any irregularities in his office shall cease from this time forward.

The Chicago Civil-Service Reform Association has sent to each of the Chicago Congressmen a circular asking them to support the bill repealing the four years' limitation upon the term of certain Federal officers.

A riot took place at Braddock, Pa., on Thursday morning between Poles and Hungarians, employed at steel works there. Three men were injured. The riot was the result of race hatred. The mob was dispersed by an organized body of citizens.

The steamship *Oregon*, of the Guion Line, arrived off Fire Island at 4:42 P. M. on Saturday, having made the quickest trip on record between Queenstown and New York. She made the run of 2,861 miles in six days, ten hours, and ten minutes, an average of 18.57 miles per hour.

A distinguished audience attended the formal memorial service in honor of Wendell Phillips at Boston on Friday. A prayer was offered by the Rev. M. J. Savage, and an original poem was read, written by Mrs. Mary E. Blake. Mr. G. W. Curtis was about three-quarters of an hour in delivering his oration, which is highly praised for its eloquence and just analysis of the great orator's character.

Mr. Thomas G. Appleton, of Boston, died in this city on Thursday, at the age of seventy-two. He was a brother-in-law of the poet Longfellow. For many years he has been distinguished as an intellectual man, a wit, a writer for the press, and an artist. He was wealthy and gave liberally to Boston charities.

Alvin J. Johnson, a well-known publisher of this city, died on Tuesday, at the age of 58. His most important enterprise was Johnson's Universal Cyclopædia.

FOREIGN.

At 9:30 o'clock on Tuesday morning an earthquake shock of considerable force was felt in the eastern counties of England. Localities in Essex and Suffolk were the scenes of greatest disturbance. At Ipswich, the capital of Suffolk County, the shock was so severe that the walls of the houses were perceptibly shaken. Colchester in Essex was the centre of the most serious disturbance. The concussions lasted half a minute. All buildings were shaken. The tall chimney stacks of the factories crashed to the earth, and other lofty structures were destroyed. The spire of one of the largest churches in the city, 150 feet in height, fell to the ground. In one part of the town a fire was caused by the shock. In private houses furniture was overturned and broken. The people were terror-stricken. The shock was also felt at Chelmsford, Southend, and Shoeburyness. In London there were numerous indications of the proximity of the earthquake. The telegraph instruments were shaken, and the shock was distinctly felt in Cheapside and Fleet Street.

In the House of Commons on Tuesday George J. Dodson (after making a report on the appearance of cattle disease in Cambridgeshire, which, however, he showed not to have come from America) made a motion to restore the Cattle Bill to the original form in which it was introduced in the House of Lords by Baron Carlingford. The bill as amended went too far, and would hamper trade. It was understood that the Government attached great importance to Mr. Dodson's motion, which was, nevertheless, rejected by a vote of 185 to 161. Eighteen Parnellites voted against the Government. The Government asked for time to consider the position in which they were placed by the vote. On Friday they will state the course they intend to pursue.

There are rumors of the early retirement of Mr. Parnell from the leadership of the Irish Nationalist party. Two reasons for this step are assigned—one, that he is tired of Parliamentary life, and the other that the party is wearied of him.

A number of rifle cartridges were found on Tuesday at the Four Courts, Dublin. The officers of the court and the jurors have received threatening letters. A notice has been found in Phœnix Park, near the spot where Lord Frederick Cavendish and Under-Secretary Burke were assassinated, declaring that the Invincibles are impregnable.

The activity of the Irish Anarchists in France continues unabated. The funds of Fenian agents in Paris have been recently augmented by the receipt of $3,000 from America. Small packets of dynamite have been forwarded from France to England, amounting in the past three weeks to a total of 250 pounds. A girl carried most of it across the chann l. The dynamiters in England are opposed to isolated attempts. They contemplate a general explosion in various parts of the country on a certain day and hour. The total amount of the dynamite fund is £16,600. £4,000 has been expended in the various dynamite attempts, and for the defence of the dynamiters who have been arrested.

The Paris correspondent of the London *Times* has had interviews with prominent Irishmen in the French capital. Patrick Casey is strongly in favor of the dynamite policy, and upholds the Irish Invincibles in the doctrines they avow and the course they pursue. He declares it probable that the dynamite policy will be extended to the blowing up of Atlantic passenger steamers, and afterward of merchantmen, thus ruining England's commerce. James Stephens and John O'Leary condemn the dynamite policy, but advocate an armed revolution.

James Stephens is discussing in Paris with prominent Irishmen the formation of a new Irish party, which shall embrace the societies now existing which disapprove Mr. Parnell's theories as well as those which oppose the use of dynamite, the object being to secure united action. A conference will soon be held in Paris to decide upon the platform and future operations of the new party.

The Paris police authorities have decided to expel from France two Austrian Socialists who were recently arrested. The police believe that they will presently have secured sufficient evidence to justify the expulsion of several prominent Irish-Americans. On the other hand, it is reported that the French authorities deny that they intend to expel suspects. No trace has been found of the reported dynamite factories in the North of France. The English detectives have failed to connect any of the Irish-American suspects in France with the plots.

The celebration of the tercentenary of the foundation of Edinburgh University was continued on Thursday by the conferring of honorary degrees to the number of 120. The degree of LL.D. was conferred upon the notable visitors. Among this number were Mr. James Russell Lowell, the American Minister, and M. de Lesseps, who were loudly applauded. Among those honored with the degree of D.D. was Professor William Henry Green, of Princeton. Mr. James Russell Lowell made a speech at the celebration on Friday, expressing the pleasure which he, who had been a teacher for twenty years, felt at meeting the students face to face. He dwelt on the importance of the teacher's position and the responsibilities of youth. The celebration was brought to a close on that day with an illumination of the city.

Queen Victoria was on Saturday reported ill at Darmstadt. She was better on Sunday.

A despatch from Khartum to the London *Times* dated April 7th said: "The people are heart-sick of hoping for English relief. The town is now in the centre of an enormous rebel camp. Our Krupp munition is rather short. The situation is critical. The rebels have frustrated an attempt to send a steamer to Berber." An English lady at Cairo on Thursday offered a reward of $100,000 for the rescue of General Gordon.

Gordon telegraphed under date of April 9th that a merchant had reached Khartum from El Obeid after a journey of twelve days. The merchant reports that the Tegeba tribes had twice defeated El Mahdi, who suffered heavy losses, and that El Mahdi is now as completely hemmed in as General Gordon is. This is doubted.

Under date of April 9, the foreign consuls at Khartum report that General Gordon considers that the time for retreating has arrived. He will send with Colonel Stewart and Vice-Consul Power, who are to return to Lower Egypt by way of Abyssinia, all foreigners who choose to accompany them. He himself has no intention of retiring. He hopes that England will yet send him aid.

General Gordon telegraphed on Thursday to Sir Evelyn Baring that his position was hopeless unless Zebehr Pasha were sent to Khartum immediately. Zebehr Pasha is willing to go to Khartum and act under the authority of the Khedive, but not under General Gordon. The British Government will not send Zebehr.

It was reported from Cairo on Sunday that General Gordon had given notice to the British Government that hereafter, owing to the difficulty of sending messages, he would act on his own responsibility. General Gordon telegraphed as follows to Sir Samuel Baker, under date of April 8: "We have provisions for five months, but we are hemmed in by 500 determined and 2,000 ragtag Arabs. Our position will be much better when the Nile rises. Senaar, Kassala, Dongola, and Berber are quite safe for the present. Do you think that if an appeal was made to the millionaires of England and the United States for £200,000 it would be available?"

It was telegraphed from Cairo to a London newspaper on Monday that General Gordon had sent a telegram to Sir Evelyn Baring expressing the utmost indignation at having been abandoned by the British Government, and asserting that he would act independently. It is believed in Cairo that the Government has determined to despatch the utmost available force of all arms of the Egyptian army to Khartum. It is hoped that the force will be ready to start in six weeks.

Three hundred Egyptian troops and six hundred non-combatants, preferring to make the hazardous attempt to march to Berber to starving inside of Shendy, set out a few days ago from the latter place. Part of the number went slowly by steamer down the river, while the others marched along the river bank. When two hours' distance from Shendy they were attacked by Arabs, and, after a short fight, all the troops excepting a few were massacred. The Arabs afterward captured Shendy. Few escaped the general massacre. Two thousand men, women, and children were slaughtered. Many of them were refugees from Khartum.

There was a rumor at Cairo on Tuesday that the rebels had captured Berber.

The London *Times* on Wednesday announced that Mr. Henry M. Stanley, the African explorer, had resolved, before leaving Africa, to reach from the Congo country one of the Egyptian stations in the Monbuttu country, on the River Welle. This is the task that General Gordon was intending to attempt before he was diverted to Khartum.

A Paris newspaper asserts that M. de Brazza, the French explorer in the Congo country, has signed a treaty with the "most powerful sovereign in Western Africa," who has placed all the right bank of the Congo, from Brazzaville to the Equator, under the protection of France.

General Millot, commander of the French forces in Tonquin, in a telegram dated Hanoi, April 16, said: "The enemy has again been encountered not far from Hunghoa, and completed routed. After the engagement we destroyed the citadels of Phu-lam-tram, where the leaders of the Black Flags had taken refuge. Our forces are now following the right bank of the river Dai with the object of threatening the enemy in the south and obtaining redress for the massacre of the missionaries. The Black Flags have withdrawn to northern Tonquin."

In a recent speech at Périgueux, Prime Minister Ferry of France gave a general discussion of the present political situation in France. He said that most of the foreign questions which were awaiting solution when he assumed office had been settled. He spoke in high praise of the gallantry of the French troops in Tonquin, and said that to it was due the settlement of the troublesome Tonquin question. Coming nearer home, the speaker said France could never allow foreign interference with her legitimate interests in Europe. In his opinion, French democracy could exercise a peaceful and salutary influence on Europe, which had suffered in the past from a failure to preserve a proper balance of power. The true policy of France should be to continue firm and steadfast in her present course. The time had now arrived, the speaker thought, when the country was ready to discuss the revision of the Constitution. The Government was desirous of such a revision, but thought it should be moderate and based upon the actual terms of the Constitution at present in force.

The appointment of Prince Chun, the Emperor's father, to the control of the Grand Council of the Empire of China, has met with great opposition, but the Empress has overruled it. The anti-foreign party is now in the ascendant.

Monsignor Rende, the Papal Nuncio, has returned to Paris from Rome, charged with a special mission to Prime Minister Ferry, which is expected to influence the future relations of France and the Vatican. Rumors are again afloat to the effect that the Pope will presently seek an asylum in France.

At a Spanish Cabinet council on April 15, the King expressed his fears that the United States might refuse to take cognizance of the protest forwarded by the Spanish Government on account of Aguero's escape, and at first opposed the presentation by Señor Valera of the protest to the Washington Government. Señor Canovas del Castillo, however, carried his point, and the instructions were forwarded.

The Spanish Government has taken into serious consideration the subject of the economic crisis in Cuba, and is preparing radical reforms in Cuban affairs. Expenses are to be reduced from $36,000,000 to $27,000,000 per year.

The Nihilist organ, the *Messenger of the Will of the People*, which has a large circulation in Russia, will soon publish an article by Degaieff, the leader of the assassins of Lieutenant-Colonel Sudeikin, describing the latter's character, which is portrayed as a type of the social and political immorality of Russia. He was an adventurer, utterly unscrupulous, and aimed at the office of Minister of the Interior and the dictatorship of Russia.

Dr. Windthorst, leader of the Ultramontane party, intends to move in the German Reichstag an amendment to the bill prolonging the anti-Socialist law which will render it more lenient. He will also move a resolution proposing that the penal laws, and especially the press law, be made more stringent so as more efficiently to combat social democracy. He intends further to ask the House to consider the penal law which deals with the illegal use of explosives.

The Mexican Government is negotiating with the representative of the Franco-Egyptian Bank in the City of Mexico, for a loan of $20,000,000, $10,000,000 to be paid to the present administration and $10,000,000 to the incoming administration.

NEW YORK IN NATIONAL POLITICS.

A MORNING contemporary, discussing the Utica Convention, says that "every Republican vote will be wanted in November." This is quite true. New York will be the most influential State of the sisterhood at both the National Conventions to be held this year. Her influence is not measured by the number of her population merely, but is much greater by reason of the balance-of-power vote which she holds between the two political parties. Even this does not measure her full importance. If she were strongly Republican, or strongly Democratic, she would count only for the number of votes she is entitled to cast in the Electoral College ; but being doubtful as well as preponderant, her position is such that each party must take her for the starting point of all its calculations, and, in choosing a candidate, must satisfy or seek to satisfy the voters of this State before consulting the preferences of any other. Ohio holds the place next in importance to that of New York, being the only "October State," but she is of less consequence because she has never deviated from her fidelity to the Republican party in national elections, and also because her vote is not absolutely requisite to the success of either party. The party which carries New York can dispense with Ohio. Neither party can afford to lose New York, or to put her vote needlessly at risk. She is the political *sine qua non* of the Union.

This peculiar position is the result of circumstances—the circumstance that votes of the States are cast each as a unit, that of New York being very large ; and the circumstance that all the Southern States are Democratic, while most of the Northern ones are Republican. The citizens of New York have never been elated by their disproportionate political importance. Their sense of responsibility has perhaps been heightened by it. The growth of the independent vote in the State, which is by no means confined to persons of Republican antecedents, is due, in part at least, to the fact that independent voting can be made tremendously effective. That it has become so is recognized on all hands. The issues which have divided parties for a whole generation are so far decayed and withered that the most puzzling question a voter can ask himself is, what *principles* he expects to sustain and uphold by his vote. If a Republican asks himself this question and pursues it to a logical answer, he will probably conclude that his only reason, aside from the force of habit, for voting as he does, is that the Republican party embraces the major part of the educated, sober, honest, and law-abiding class in the community, while the Democratic party embodies the larger share of the ignorance, drunkenness, knavery, and unthrift. Not that there is any distinct party line separating the vicious and unprincipled from the pure and good, but that there is, in the belief of most Republicans, a preponderance of the latter in their own party. Nevertheless, the feeling that the worst Republican is better than the best Democrat is not nearly so common anywhere as it was a few years ago, and it is less common in New York than in some other States where all possible wickedness is freely ascribed to the Democrats, because they have never had the opportunity as office-holders to show how much mischief they are capable of. The State administrations of Tilden, Robinson, and Cleveland have been as respectable and conservative as those of Fenton, Dix, and Cornell.

Because New York is a pivotal State, because she has a large and growing independent vote which perceives no difference between the two parties, except as the Republican party is believed to embody the larger share of thinking, steady-going people, it is of the first importance that no shock should be given to this belief by the nomination of a questionable candidate for President. The Democrats can bring their rank and file up to the support of a shady character much more readily than the Republicans. The Democrats could nominate such a candidate as Butler with much less risk than the Republicans would incur in nominating Blaine. If it be true, therefore, that "every Republican vote will be wanted in November," the Utica Convention (in session as we go to press) should be careful not to choose delegates to Chicago committed to a candidate whose nomination would lead to instant and fierce rebellion in the party. Mr. Blaine is the one candidate about whom the minds of the great body of New York Independents is made up. What they know of him they have learned from his own testimony, and not from the accusations of enemies. Their misgivings are, therefore, unappeasable. Their repugnance toward him is more deep-seated and irreconcilable than it is toward Mr. Arthur. The nomination of the latter would not lead to rupture or revolt in the party. The nomination of the former would. It would give the State to the Democrats by the largest majority that has been cast for any Presidential candidate since the war. It will be useful for the Utica Convention to remember that Garfield's majority in the State was only 0.27 of one per cent., equal to about one vote in 350. Not to mention more recent elections, it is worth asking whether there is any margin in such a majority to warrant the taking of unnecessary risks in an election at which "every Republican vote will be wanted in November."

"VINDICATION."

WE print elsewhere another communication from the correspondent whose inquiries led us a week ago to reproduce the chief objections to Mr. Blaine's nomination for the Presidency. About Mr. Holmes's dislike of what he calls "insinuations in regard to Mr. Blaine's ability, his book, his living in Washington rather than in Maine," and so forth, nothing needs to be said except that it is Mr. Blaine and his buglers who keep this sort of gossip going in the press; and that anybody who professes not to know what they mean by it is too guileless a person to be argued with. Freedom from newspaper notice of his sayings and doings is as much within Mr. Blaine's reach as that of any other man in the community. The reason he gets too much of it is that he thinks a good deal of it useful to him just now.

The important point in Mr. Holmes's letter is the stress he lays on Mr. Blaine's election to the Senate in Maine, after the publication of the Mulligan charges, as a "vindication." The loose way in which this term has been employed in politics of late years has made it very useful to a certain class of statesmen, and we are glad therefore to have an opportunity of defining its meaning. A man who is accused of wrong-doing may be "vindicated" in either of two ways. He may show that the charge is untrue, or that some persons in whose estimation it was expected to injure him attach no importance to it. We believe the dictionaries will justify the application of the word to both of these processes. But they are very different processes, and politicians when they get into trouble have of late been in the habit of shifting the term from one to the other, as best suits their purpose or their needs. One of them may be called vindication by proof, and the other vindication by hurrah. A member of Congress, for instance, is charged with corruption. He has absolutely no defence on the merits; but he goes back to his district, and, by a skilful use of his machine, a careful avoidance of all discussion of the charge, and a vigorous fanning of the enthusiasm of his personal followers, he may secure the latter kind of vindication; or, in other words, may prove that the charge has not damaged him with his constituents sufficiently to prevent his reëlection. But this vindication may be due either to the ignorance of his constituents about the charge, or to their unwillingness to undergo the mental trouble of inquiring into it, or to the lowness of their own moral standards. Illustrations of this are fresh in everybody's memory.

Tweed was vindicated in this way by reelection to the State Senate after his frauds had been exposed. When the late Judge Barnard had been convicted on impeachment, and his sentence was under discussion, the question of inflicting the extreme penalty of perpetual disqualification for office was decided in the affirmative, largely, we believe, under the influence of the consideration that, if it were not inflicted, he would go back to the very scene of his enormities and get himself vindicated by a reëlection to the bench. Vindications of this sort occur in this city every year. Elsewhere Robeson has thus been vindicated; so has Keifer; so has Benjamin F. Butler; so have many others. There is hardly anything in the way of vindication that a well-organized machine may not be made to do in many small constituencies, as long as the master hand has hold of the crank. In fact, the use of the electoral machinery for this purpose is one of the greatest triumphs of modern political management. But, of course, as soon as he has achieved it, a politician always turns round and begins to use the term vindication in the other sense, as proof that the charge against him was really untrue. He talks of his renomination or reëlection exactly as if it were the submission of the accusation against him to a competent tribunal, and its dismissal after a careful examination of all the facts. In other words, he describes as a verdict of "Not guilty" what was really a verdict of "We did not know much about the matter, and

took no trouble to inform ourselves, and, anyhow, did not care a cent whether the charge was true or false."

This vindication by hurrah can only, however, be made to take the place of vindication by proof in small constituencies, where the candidate has some personal hold on the imagination, or affection, or pockets of the voters. It cannot be safely tried by any man outside what in political parlance is called his "home." Before other constituencies than his friends and neighbors, and especially before the vast constituency known as the nation, nothing will save a public man but vindication by proof. In that forum he has to face the conscience of the whole people, and no defences but defences on the merits are allowable. It would be a sorry day for the United States if it were possible to convert the election of the highest officer of the Government into a vindication by hurrah, and we may be sure no such phenomenon will be witnessed. Anybody who asks for the suffrages of the American people must have a real answer on the merits to any charge of personal or political baseness that may be brought against him. He cannot dispose of it by ignoring it, or mentioning the names of friends of his who do not believe it.

In fact, it is for every party the soundest policy to discourage the claims of champions who have even ill-founded accusations long standing against them. From "campaign charges," started at the opening of the canvass, or in the heat of it, of course no candidate can be protected; but such charges seldom injure anybody. But accusations which have long hung over a man's head, and which, for whatever reason, whether his misfortune or his guilt, he has been unable to refute, ought to constitute an absolute bar to a Presidential nomination. No man, however gifted or valuable, or ill used, has any right to have the Presidential canvass turned into a judicial inquiry into his personal or political honesty. There are tribunals created for the express purpose of carrying on such inquiries, and to them any politician who feels badly the need of investigation ought to resort. Mr. Blaine in all his troubles has avoided this method of redress. The only answer he has ever vouchsafed to the damaging revelations of his own letters is, that the Committee before which they were produced was largely composed of "rebel brigadiers." His political supporters are now, after having had seven years to think over it, unable to do any better. They are quite ready to talk about the scandals with which nobody has ever said he was connected—of which we admit there are thousands; but about the scandal which is really damaging him they are as silent as the grave.

THE PROPOSED COURT OF APPEALS.

THE Davis bill for the relief of the Supreme Court, substantially in the form in which it passed the Senate last year, has been reported by the Judiciary Committee of that body. It provides for the appointment of two additional judges in each circuit, and the creation of a Court of Appeals in each of them which shall relieve the Supreme Court by stopping and disposing of business on its way there. As there are nine circuits, the bill will make necessary the appointment of eighteen more Circuit Judges. The Court of Appeals is to consist of the Supreme Court Justice assigned to the circuit, the Circuit Judges and two of the District Judges (to be designated by an order of the Court). Any four of them are to constitute a quorum. In this circuit, for instance, embracing the districts of Vermont, Connecticut, and New York, the Court would consist of Judge Blatchford, Judge Wallace, any two of the following District Judges, viz.: Judges Coxe, Brown, and Benedict, of New York, Judge Wheeler, of Vermont, Judge Shipman, of Connecticut, and the two new judges. As Judge Blatchford's time is fully occupied with his work at Washington, the Court would usually consist of any four of these excepting him.

The right of appeal to this Court from the Circuit or District Court will exist in all cases where the property in dispute exceeds $500 in value, or when the court below shall certify that the matter involved is of sufficient importance to warrant an appeal. The decisions of the proposed Court of Appeals are in almost all cases to be final upon questions of fact, but a review upon the law may be had upon writ of error or appeal, in the manner now provided by law, to the Supreme Court of the United States, in cases where the matter in controversy exceeds in value $10,000, exclusive of costs, or where the adjudication involves a legal question of sufficient importance to require that the final decision should be made by the Supreme Court, or a question upon the construction of the Constitution, or of the construction or validity of a treaty or of a law of the United States. In patent or copyright cases in equity, a review by the Supreme Court may be had, without regard to the amount in dispute, upon questions of law or fact, provided that the Court of Appeals shall certify that the question involved is of sufficient importance to render it proper that the final decision thereof should be made by the Supreme Court.

The imposition of the $10,000 limit is, as we understand the matter, useless and otherwise open to criticism. The only reason for its introduction ever put forward was that it would relieve the Supreme Court. But if the Judges of the Court of Appeal are to have the right to certify cases to the Supreme Court without regard to the amount involved, the limit seems to become of no value. Why should an $11,000 case go to Washington as a matter of right, without regard to the triviality of the questions involved, while a $9,000 case, involving the same questions, is refused access to the Supreme Court, on account of the triviality of these questions? Further than this, it is now urged by the friends of the $10,000 limit that, as a matter of fact, the expense of taking a case to Washington, without any intermediate Court of Appeal, is so great that unless something like $10,000 is involved it does not go there; and this may very likely be the case. But then, if a heavy pecuniary limit is fixed by the circumstances of the case, why put one in the act at all, when the only effect of it is to enable the enemies of the scheme to raise the cry that the Supreme Court is to be made a "rich man's court"?

It is rather startling that within a very few years, after adding nine new Circuit Judges to the Federal judiciary in order to relieve the Supreme Court, we should now be called upon to add eighteen more, besides new appeal machinery for the same purpose, the condition of the Supreme Court being worse than ever. The Federal bench will, if the bill pass, be well equipped. With nine Judges of the Supreme Court, twenty seven Circuit Judges, and fifty-three District Judges, it ought to be able to dispose of its business. The development of the judicial system of the United States, no matter at what point we observe it, seems to follow a certain law of evolution, which tends to make the ultimate Court of Appeal a tribunal solely for the consideration of points of law reserved from trials below. The judges of last resort in almost all the States try appeals only on paper, and never meet juries, see witnesses in court, or actually try a case. The old system of having the same judges administer justice in the trial courts, and pass upon the final appeal, sitting in banc, handed down from the earliest times, lingers on in the Supreme Court at Washington and a few State Courts as a sort of "survival." With the new Court of Appeals, we presume the judges will see less and less of their old circuit business, and will in the end be confined altogether to points of law coming up to them from all parts of the country, while for most purposes the new court will within each circuit play the part that the Supreme Court now does for all of them.

EGYPTIAN ADMINISTRATION AND ADMINISTRATORS.

CAIRO, March 25, 1884.

To the outside public the only interesting questions relating to Egypt are those connected with the relinquishment of the Sudan, and with the nature of the relationship which is in course of being established between England and Egypt. But to those responsible for the government of Egypt from day to day those questions are comparatively remote, and, momentous as they are, are capable of being even left out of account in the course of grappling with pressing problems which can scarcely brook an hour's delay.

Such a one is the problem of the functions of the mudirs and the police. It is found that the reforms which have been somewhat spasmodically introduced in consequence of Lord Dufferin's recommendations, have gone too far in the direction of paralyzing executive and administrative force in the provinces. The new Criminal Codes, constructed on the French model, have introduced a hierarchy of *procureurs* and *juges d'instruction*, who have, it is alleged, encroached to such an extent on the functions of the police and the mudir that offenders of the worst kind are allowed time to escape, or to obliterate the traces of their guilt before the tardy foot of scientific legal investigation can reach them. It is said that, according to the new system superimposed on the country, there are three stages interposed between the original complaint of a crime having been committed and the first real trial before a court of first instance. The police are informed of the offence. It is their duty to communicate at once with the "Parquet," an institution of great prominence in the French system, which, according to English ideas, would be a sort of Crown Prosecutor's of

fice. The Parquet, or so-called "Ministère Publique," communicates the fact and circumstances of the offence to the *juge d'instruction*, a judge of the Court of First Instance delegated for the purpose of investigating, with the aid of police placed at his disposal, the circumstances of all crimes committed in the district. His report, founded on examination of witnesses, perusal of documents, and, if necessary, inquiries on the spot, is presented to his Court of First Instance, and affords the groundwork of the whole proceedings.

It is obvious that, as a purely legal machinery, nothing could be better than this. At the earliest possible moment the burden is shifted from the shoulders of the quasi-military police, and relegated to legally-qualified practitioners in the closest relations to the court before which the trial takes place and to the ministry of justice. If the court is dissatisfied with the mode of collecting the evidence, or calls for what is named a fresh "instruction," all the apparatus is in its own hands and subject to its constant supervision and control.

On the other hand, those responsible for the good administration of the country allege that serious delay is occasioned in tracking offenders and following up the indications of crime while still fresh. It may be that the police have to travel or send to a great distance to communicate with the local *procureur*. Any way, the proceeding of search is interrupted and passed on to a wholly different class of officials, just at the point when prompt and continuous action promises to be most fruitful. A further complaint is made that the service of the police under the *juges d'instruction* is most unfavorable to police discipline, and is attended by the proverbial consequences of impotent attempts to serve two masters.

It is curious that each of the rival systems—which may be roughly classified as the magisterial, or English, and the procurial, or French system—has its champion in an eminent English administrator. Sir Benson Maxwell, at one time English Chief Justice of the Straits Settlements, and now at the head of the judicial administration in Egypt under the title of Procureur-Général, has become the champion of the method of search of which the *juge d'instruction* is the main instrument. When first he reached Egypt, nearly a year ago, he was a stout opponent of the new Codes and the French system of criminal investigation. He loudly professed that he knew nothing about them, or so far as he knew anything he disliked them. But longer familiarity with the working of the system, or a deeper acquaintance with the condition of the country, or a more hopeful view of the judicial *personnel* who would fill the new posts, brought about a complete change of view. Sir Benson Maxwell has, indeed, introduced many beneficial changes into the substance of the Penal Code, and especially in the matter of evidence; and no doubt, if the field were quite free for a choice between English or Anglo-Indian and French methods of procedure, he would unhesitatingly prefer the former. But he regards the aggressive claims of the police as a perilous harking back to the illegal and anarchical system of government by autocratic mudirs. He fears that what has been gained for law is too precious to be lightly parted with; and till it is proved, after fair trial, that the new system is unworkable, it ought not to be sacrificed because of what are perhaps only momentary obstacles.

The champion for the magisterial and police system of criminal investigation is Mr. Clifford Lloyd, English "Inspector of Reforms," and Under-Secretary of State in the Ministry of the Interior. Mr. Clifford Lloyd is well known as one of the most energetic of Irish magistrates, and he has also had administrative experience in India. In some senses—and those, in the eyes of his numerous opponents, not wholly good ones—he is the strongest Englishman in Egypt. He has nearly absorbed into his own hands the whole and irresponsible management of all the numerous matters which fall under his department. He has already reorganized the prisons, and made a special department of them under the Inspectorship of Dr. Cruikshank, an Englishman of long-tested capacity in the East. He has placed sanitary matters under another competent Englishman, Dr. Sandwith. He has given the most important impulse of the Home for Freedwomen Slaves. He has invented, and is in the course of imposing, a municipality of Alexandria. Above all, he has concerned himself for months past with the reorganization of the constabulary, and, during the absence of General Baker in the Sudan, the whole of this interminable task has fallen upon him.

Now, like Sir Benson Maxwell, Mr. Clifford Lloyd, on his first arrival in this country, some eight months ago, protested against the relations created by the new Codes between the courts of justice and the police in the matter of the investigation of crime. Like Archimedes in search of a lever, he sought for the police magistrate or justice of the peace, as the true and sole medium of communication between the police and the Court of First Instance. Instead of undergoing any change, Mr. Clifford Lloyd's views on this point have only been confirmed and developed. He complains now that the mudirs, robbed though they are of illicit means of oppression, have had no compensating power accorded them. The mudirs themselves have come in large numbers to Cairo, refusing to be responsible for the preservation of order if their powers are not enlarged, the police placed more under their control, and the functions of tracking crime and criminals up to the point of trial restored to them. Mr. Clifford Lloyd believes their complaints well founded, and is bent on bringing about the changes they demand. But he intends to couple it with great changes in the *personnel* of the mudiriate, with a new system of records and inspection, and with a stern, centralized, and English control of the police. However, the victory will not be won at once. A.

MALLET DU PAN.

PARIS, April 9, 1884.

THERE is a singular contradiction between the world of facts and the world of ideas. The principles of the French Revolution have never been more completely in the ascendant than they are at the present moment in France; they are not only triumphant in the common law, they are also triumphant in the constitutional law. We can see the famous device "Liberty, Equality, Fraternity" on all our monuments. I beheld it only a few days ago in huge black letters on the wall of the chapel called the Expiatory Chapel, erected in 1815 in memory of Louis XVI. and of Marie Antoinette. At the same time, it cannot be denied that in intellectual circles there is a strong reaction against the Revolution and its principles. The various histories of that epoch, written by writers of the Liberal school, such as Thiers, Mignet, Louis Blanc, Michelet, Lamartine, are looked upon almost with contempt by the new historical school, which hates great theories, and professes to be only satisfied with hard facts and with documents. The historical school sees France diminished, deprived of some of its old provinces, isolated in Europe, surrounded with a chain of monarchies which are its natural enemies, deprived of any other influence but that of its vices and its pleasures. It has begun to doubt the virtue of the famous principles of 1789, and it has begun a grand inquest upon the events of the Revolution.

I will say at once that this inquest is not always conducted with great wisdom. The documents which are now assembled are not all of equal value. Taine, for instance, in his great work on the Revolution, which is not yet finished, has thrown together a multitude of small facts which are as apt to conceal as to reveal the truth. The new school seems to consider all documents as equally valuable, all letters as genuine, all private papers as valuable. The archives of the Foreign Office have lately been open to the public, and we must expect to find an immense amount of despatches written by the ministers of the French Republic, of the Directory, and of the Empire. Some of them have already been published, and their republication has not added much to our knowledge. There must, in the end, be some choice in the materials employed by history; we cannot build a palace with stones of every sort and of every size. Among the most remarkable observers of the French Revolution M. Taine cites four, Rivarol, Malouet, Gouverneur Morris, Mallet du Pan. I will speak to-day of the last, as M. André Michel has just published two volumes of the 'Inedited Correspondence of Mallet du Pan with the Emperor of Austria.' This correspondence embraces the years 1794 to 1798, and the manuscripts of it are preserved in the Archives at Vienna.

Mallet du Pan belonged to a family which had left France, not at the time of the Revocation of the Edict of Nantes, but long before, at the beginning of the wars of religion in France. This family had settled in Geneva; one branch had returned afterward to France, another had remained in Switzerland. Mallet du Pan was born in 1749. He was prepared for political life in Geneva. At the age of twenty-two he wrote his first pamphlet in defence of his party. He saw in this miniature state all the elements of political strife—the struggle of the old patrician families and of the democratic party, little revolutions, small *coups d'état*, perfect anarchy, followed by dictatorship. He left Switzerland for France after 1789, and became one of the writers of the *Mercure de France*. He was already a friend and a correspondent of Voltaire, of Samuel Romilly, of Linguet. The *Mercure* was, so to speak, a post of observation. Mallet du Pan could write afterward to Hardenberg: "No personal views, no political engagements, no passions influenced my writings. I am not a Frenchman; I was born a Republican; I have deserved the attacks of all the extreme parties; but thirty years of experience under a popular Government did not allow me, during the first days of the Revolution, to perceive its utility. I did not doubt that, undertaken by corrupt men, leading a presumptuous, frivolous, ardent, and perverted nation, it would be the misfortune of Europe, after having been the misfortune of France." Mallet du Pan, in his *Mercure*, was like the experienced sailor who sees the signs of the tempest; he was not intoxicated by the theories which began to agitate France long before 1789.

The letters of Mallet du Pan may be reckoned among the most valuable papers that the historian can consult on a period which will always be counted one of the most momentous in modern times. Mallet du Pan played a part which was a very new one: he was a journalist at a time when journalism was in its infancy. He had correspondents in all parts of France, and, it may be said, of Europe; he was a sort of political agent without any definite credentials. His curiosity seems to have been boundless: he collected information on every subject. He was

not a statesman, but he was a public man. Taine justly remarks in the preface which he has written for these volumes of correspondence, that Mallet du Pan had a rare faculty: he could discern all the forces which were at work around him, and choose good specimens of each group of men. "On our political assemblies, the parties and their followers, his judgments are exact and penetrating: I have never found him in error. . . . Sometimes in rapid outlines, sometimes in large and profound sketches, sometimes in finished pictures, he represents whole classes—the nobility, the clergy, the Parisians, the provincials, the administrators of the Constituante, the proconsuls of the Convention, the functionaries of the Directory, the men of the Terror, the men of Thermidor, the men of Vendémiaire, the royalists within, the emigrés without, the Feuillants, Girondins, Jacobins of all epochs. . . ."

Mallet du Pan saw very early that the Jacobins would become in the end the dominant faction in the Revolution: he understood them as well as Burke, and "nobody," says Taine, "better understood their fanaticism, their instincts, their sectarian ways, their dogmas; their ascendancy over minds destitute of culture, the strength of their propagandism, the power and the danger of their dreams, their capacity for destruction and their incapacity for reconstruction, the mechanism by which their doctrine transformed a half-lettered man or a useful workingman into a 'philosopher with a pike,' and by which they conducted him from ignorance to presumption, from enthusiasm to crime, by persuading him that he was saving his country and regenerating humanity." The judgments of Mallet du Pan are very severe, very hard; for he was by principle a Liberal, and the Revolutionists were essentially intolerant. They had all imbibed the views of Rousseau. The dream of Rousseau was a sort of socialism in which the state was omnipotent, the individual completely sacrificed to the community, public authority entering into all the details of life—in the relations of the family, of capital and labor, in education. All conditions were to be levelled, all religions abolished; society was to be remodelled. From 1789 to the Consulate these ideas became completely dominant; few understood a Republic in which the individual would have his own free domain. Mallet du Pan was among the few who dreamt of a reconciliation between the rights of the state and the rights of private conscience.

He fought the battle of individual conscience with the greatest courage. For forty months, he assures us, he never went to bed with any assurance of being alive the next day. After a vain struggle, he was obliged to run away, and he took refuge in Switzerland. When this country was conquered by the French armies, he was banished by a special decree of the Directory, and fled to England. "I have lost everything," said he, "in losing Switzerland—country, relations, friends. . . . Switzerland, like Athens after the invasion of Alaric, is now nothing more than the bleeding skin of a victim offered in sacrifice." He founded in England the *Mercure Britannique*. "But for the hospitality of the English people, I should still," he said, "be experiencing the torment of silence." It was while he was still in Switzerland, in 1794, that he began to correspond with the Emperor of Austria, under the cover of Count Colloredo, and with Prince Hardenberg, the Minister of the King of Prussia. This work gave him some means of subsistence. He was ruined; he had been obliged to leave everything in France—his library, his manuscripts, his silver. He was on the point of making himself a schoolmaster when he received the first overtures from Vienna and from Berlin. He was known as a man of honor, and had already accomplished two secret missions, one to Monsieur and the Comte d'Artois at Coblentz, and another to the Emperor and the King of Prussia at Frankfort. The letters of Mallet du Pan can therefore be classed among the despatches of that occult diplomacy which has always been a necessity in troubled times. Mallet du Pan wrote to the sovereigns in the character of what he called a "European." "Every man," said he, "has the right to show his alarm. Every European must take part in this last combat of civilization; we are all, with all our goods, in the same ship."

The correspondence is of such a detailed nature that it can hardly be analyzed. It follows almost day by day, from 1794 to 1798, the transformations of political parties in France. It analyzes all the elements of French society, thrown into the crucible of the Terror. You might as well attempt to describe the movements and the shades of the clouds during a tempest. Mallet du Pan had essentially a philosophical mind, and he indulges in generalities more than in anecdote. In this respect he differs essentially from the writers of the preceding time. He has no sense of humor; he is always indignant, always serious; his irony is terrible. He distinctly foresaw that the régime which immediately followed the Terror could only last by a series of continual wars, and he felt instinctively that a happy and bold military dictator would draw the curtain on the Revolutionary drama.

When Mallet du Pan was obliged to go to England, he was exhausted by his great labor, and his health was already failing. He had lost all hope: everything was giving way before the French Revolution. He made his last effort in the *Mercure Britannique*, and two years after having landed in England he died at the age of fifty. His articles and letters have not the grace of Rivarol nor the sublimity of Chateaubriand, but they are models of political analysis, and they are inspired by a sort of contagious conviction. They are the protest of a virtuous mind against a sanguinary school; they are a long commentary on the cry of Mme. Roland: "O Liberty, how many crimes are committed in thy name!"

Correspondence.

THE BLAINE BOOM AGAIN.

To the Editor of The Nation:

Sir: Your leading article on "The Blaine Boom," called out by my letter which you headed "A Blaine Inquiry," ignores the main thought I advanced; so I ask for more room in your columns in which again to emphasize that thought.

In 1876, when the Democratic party in Congress, new to power and eager for political capital, set dozens of committees at work to find something damaging to the character of Blaine, Bristow, Morton, and other Republican leaders, the animus of the movement was so evident that it went far towards starting a presumption of innocence for the accused. With the acutest Democratic noses on the scent, they failed to run down any substantial game, and returned from the hunt with such undisguised panting and chagrin that the object was clearly seen to have been destruction rather than justice. It cannot be doubted that this was, and is now, the judgment of the country; for these men who had thus been "investigated" lost no whit of popular regard, and notably Mr. Blaine. It is unsafe to say that this public judgment is wrong; usually in this country the worth of a public man is pretty accurately estimated by the people. Mr. Blaine has been a Senator from Maine, and has been chosen to the highest Cabinet position in our Government by James A. Garfield, since the charges you so clearly state were first published; and, without a single office at his command, and hence no machine, there is considerable sentiment in his favor in Michigan. The great party heat of 1876 has died away, and a popular indifference to party ties is generally acknowledged to be gaining the ascendancy—a fact that heralds the approach of independent thinking and voting—yet it is certain that Mr. Blaine will have a strong following in the next National Republican Convention, and that he is not regarded by the mass of the people as a dishonorable man.

While I do not enter upon a vindication in detail of Mr. Blaine, I have said enough to show that the charges, however ugly your powerful article makes them appear, are by no means fastened, and that he is yet entitled to the consideration usually shown to honest men. I look, therefore, upon insinuations in regard to his ability, his book, his living in Washington rather than in Maine, and the reports about his domestic arrangements and happiness, as unfair; it is inference such as may be employed against any public man, to claim that they are "advertising devices" used to catch the Republican nomination for President. It may be for his pleasure to live in Washington, and certainly it must be advantageous for an historian who needs access to libraries and public documents. It is not at all strange, in these days of enterprising publishers and newspaper reporters, that passages of his history should be printed in advance of the book. As an "advertising device," to increase the sale of the proposed book, such a scheme would be looked upon as shrewd and commendable. Indeed, I cannot remember one insinuation of this kind in the *Nation* the immediate cause of which is not susceptible of reasonable explanation, or that has been sustained by anything but the caustic humor of the editor.

I am not a special champion of Mr. Blaine, although, in common with many, I have some admiration for the man who marched down the halls of the American Congress "like an armed warrior, like a plumed knight"; but I am contending for the principle that damaging statements of the motives as well as of the actions of men should not be made except on very strong proof. Given the power with the pen that the editor of the *Nation* possesses, I could write plenty of cutting paragraphs about President Arthur's and Secretary Lincoln's designs on the Presidency. There is opportunity for misconstruction of motive in nearly every man's life, and the injury that is done by that kind of writing to individual character and individual happiness and prosperity is great. The injury is not to individuals alone, but is sustained by the whole country, whose reputation depends upon the reputation of its leading men. I am convinced that, in the long run, great charity in dealing with the motives of our public men would have a marked influence in producing among them a higher tone and a more conscientious devotion to duty; whereas the opposite spirit has the tendency to lower their average worth. Let there be, therefore, all possible criticism of measures and views, but unworthy motives should be ascribed only when conviction is overwhelming.

H. M. Holmes.

Lansing, Mich., April 14.

LIQUOR-DEALING AND CRIME.

To the Editor of The Nation:

Sir: As one of your oldest subscribers I must express my deep regret that I cannot conscien-

tiously renew my subscription, since you condescend to make common cause with the temperance fanatics. I abhor and oppose intemperance as much as any of these. But a nation that elevates inebriates to the Presidency and honors drunkards, cannot promote temperance by violating the principles of personal liberty and by stigmatizing the wine-producer and liquor-dealer. We might as well try to suppress arson by legislating against the manufacture and sale of matches while we defend the incendiary, and honor him if he succeeds in getting a large amount of insurance-money; we might as well charge the manufacturers of pistols and bowie-knives with the murders committed unpunished in some parts of our country.—Yours respectfully,

ISIDOR BUSH.

ST. LOUIS, April 13, 1884.

[This may be all true, but it furnishes no reason for "stopping your paper." You can only justify your refusing to listen to us any more on any question by alleging that it is immoral to differ with you on the temperance question. Do you hold this view? If so, when did you become the depositary of pure truth and right about liquor, so that nobody is fit to discuss with you who does not acknowledge your authority?—ED. NATION.]

"MASKS AND FACES."

TO THE EDITOR OF THE NATION:

SIR: In your article on Charles Reade, you speak of the dramatized version of 'Peg Woffington.' Permit me to correct a very common mistake that "Masks and Faces" is the dramatized version of 'Peg Woffington.' During my residence in London I happened to be a frequent visitor at the house of Tom Taylor, who at one time took occasion to explain to me the creation of the above novel and drama. The novel was not yet written when Charles Reade approached Tom Taylor for the purpose of writing jointly the play. Reade had the subject in his mind, but felt incapable of dramatic work. Tom Taylor then lived in Chiswick, and Charles Reade joined him there at his residence. Reade wrote the play to the best of his ability during the daytime, when Taylor was away; the latter, on coming home, used the scissors freely, and quite exasperated Reade by the many alterations which were found necessary for dramatic purposes. Finally, when the play was finished, to give free vent to his own impulses on the subject, Reade decided to put it in a form more familiar to his own pen, and wrote the novel. The latter was published almost simultaneously with the production of the play, and it was already then commonly believed that the play was an adaptation of the novel. On Taylor's suggestion, Reade corrected this erroneous impression in the introductory remarks to a later edition of the novel.

As both men are now dead, perhaps it may not be out of place, from respect to their memory, to publish what I feel sure they wished to be known.—Respectfully yours,

OTTO E. LOHRKE.

BRICK CHURCH, ESSEX COUNTY, N. J., April 19, 1884.

EXCESSIVE LEGISLATION.

TO THE EDITOR OF THE NATION:

SIR: I am amused as well as gratified that anybody should be "waiting" for a communication from me upon "responsible government," as I have felt that your readers were something more than satiated with that kind of diet. However, I beg to shake hands heartily with "Bluenose," and to express satisfaction with the opportuneness of my silence, since it has procured from him an utterance so much more valuable, if only from its novelty, than any of mine would have been. I have long felt that the Canadian Government might furnish us with valuable illustrations, but, in the first place, I possessed but little information, and did not know how to get more, and, in the second place, though our people might be willing to learn something from Great Britain, they are quite too lofty to think of taking lessons from our colonial neighbors. In one point the letter of your correspondent is very interesting to me, as I have always regarded biennial sessions as a movement exactly in the wrong direction. If the Government were carried on as it ought to be, by the executive branch, and the Legislature limited to its proper functions of "critics with the power of the purse," then, as he says, the sessions would be matters of public interest instead of public dread. On the other hand, if the Legislatures are to exercise, as now, not only their own functions, but those of the executive, then less frequent sessions would merely remove the machinery of government further from the public view, and would make the legislation, if less in quantity, as well as the administration, worse in quality than now. It is thought necessary for the efficiency of the German army that it should go through an elaborate and expensive system of annual autumn manœuvres. Our political "autumn manœuvres" are just as necessary to keep the people in training. If they work badly, the remedy is not in infrequency, but in finding out *why* they work badly. I am reminded of an anecdote, of which the want of elegance may perhaps be pardoned for the point, of a woman who said she did not see how people could comb their hair every day, as she only combed hers once a month, and then it almost killed her.

One would think that this winter's session of Congress, not to speak of the State Legislatures, might convince the public mind of the necessity of some change in the direction of leadership, system, and individual responsibility. Lest other localities should be pining for more light, I will say that I am ready for missionary work in any part of the United States. G. B.

BOSTON, April 19, 1884.

THE WAR OF THE HELLENISTS.

TO THE EDITOR OF THE NATION:

SIR: In *Harper's Monthly* for May is an article on the life and work of Dr. Schliemann, a labored and excessively one-sided argument to prove that Schliemann has a right to a position as a scientific investigator. It is not pleasant to say disparaging things of either Schliemann or his supporters; but when credentials which carry on their face such pretensions as do those of Schliemann, are offered for general circulation on the strength of certain endorsements, it is just as well to examine the endorsers. Mr. Mahaffy, the writer of the article in *Harper's*, is a Hellenist better known in England than in America, and better known, where known, for his curious blunders as to classical matters than for his insight or sound critical faculty. No scholar who has lived in Greece can have ignored the extraordinary errors of fact in the books on that country written by Mr. Mahaffy; and only a few weeks ago the *Academy* contained a review by him of a book on Greece, in which he gives the singular information that the audience in the Theatre of Bacchus could not see the Ægean from their places—perhaps the most remarkable blunder even he ever made in reference to the localities of Athens. For trustworthy scientific statement or opinion, it would be hard to find a professed Hellenist so hopeless as Mahaffy, or one so generally recognized by scientific Hellenists as unreliable in his conclusions or observations. His endorsement of Schliemann's paper is worth no more than would be that of a penniless man on the note of hand of a bankrupt.

If it is intended by force of clamor to give Schliemann scientific authority, and his theories currency and weight, then those who value the true conclusions of scientific investigation above all personal interests must raise their voices, even in personalities, to meet the issue. Neither Schliemann's theories nor his opinions have the slightest scientific value, nor does the opinion of Mahaffy add a feather's weight to them. The article in *Harper's* contains some double-pointed shafts, but the real animus of it may be found in the concluding sentence:

"But if Dr. Schliemann could harbor in his large heart the feelings of an ancient Levite [?], he might well reflect that his enemies, the pedants, have been discomfited and brought to confusion. The ablest and most learned of them, Dr. Brentano, has lately committed suicide; and if his English disciple has not gone so far as to copy him literally in this, he has at least gone as far as charitable adversaries can desire in committing archæological suicide, by maintaining theories which blot him out from the number of incipient students in that science."

Poor Brentano was an archæologist, which no supporter of Dr. Schliemann is. The English disciple alluded to is Professor Jebb, of the University of Glasgow, a scholar and Hellenist of the first order, who had the assurance to differ, courteously, and, it seemed to me, too deferentially, from Schliemann's theories of Troy; respecting the excavator's motives and enthusiasm, but showing from the vantage of his better knowledge of the authorities that certain of the Doctor's views were untenable. That he showed it conclusively is an opinion shared by most scholars whom I know, but from that day Schliemann and every one to whom he gave employment have attacked Professor Jebb with a personal rancor of which the above quotation is an example. When the controversy is carried into American literature it should be unmasked, and the combatants given their true devices.

I have in this controversy not even the bias of a personal acquaintance. I never saw Professor Jebb or Mr. Mahaffy, nor have I ever had a controversy with either. As to Dr. Schliemann, while I respect his enthusiasm and liberality, and recognize his genial personality, I must again declare my firm conviction that he has done more to retard archæological study and progress than to advance them, and that his methods and conclusions are alike obnoxious to true science.

We learn from the last *Academy* that

"The May number of *Harper's* will contain an article on 'Dr. Schliemann: his Life and Work,' by Prof. Mahaffy, who is at the present time Dr. Schliemann's guest at Tiryns."

An article so absurdly eulogistic as that alluded to justifies a great deal of that munificent hospitality which Dr. Schliemann's fortune makes it possible for him to offer to his coadjutors. It is to be hoped that the Greek archæological authorities will look sharply after the excavations at Tiryns (one of the most important sites in Greece), for reasons which will be readily understood by those who read Prof. Jebb's article on Schliemann's methods in the current number of the *Fortnightly Review*.—Yours truly,

W. J. STILLMAN.

NEW YORK, April 19.

THE GERMAN SPELLING REFORM AGAIN.

TO THE EDITOR OF THE NATION:

SIR: When, in my communication printed in No. 980 of the *Nation*, I said that final *d* in Ger-

man words was pronounced like *t*, except, perhaps, in dialects, I meant to say that (if I remember right) Fritz Reuter sometimes used final *d* in his Low-German works; but as I had not read these for some six years I could not express myself positively on this point. But as I have received letters from various subscribers of the *Nation* on this subject, most of whom are against the proposed change of final *d* into *t* in inflectional words, I must state here that, although true phonetic spelling reform would hardly allow of any deviation from its standard rules, I do not consider that point of such weight as to render its acceptance obligatory. Indeed, I for my part think that changes in the present spelling, to be acceptable to the general public, and not to the learned alone, should be as slight as possible, although it will be hard to draw the line after strict logic is given up.—Very respectfully, OTTO WOLLERMANN.

BROOKLYN, E. D., 80 Second St.

Notes.

JOHN WILEY & SONS have in preparation 'The Orchids of New England,' a popular monograph by Henry Baldwin, with forty illustrations, mostly drawn from nature; and 'Roadside Songs of Tuscany,' by Miss Alexander, edited by John Ruskin, in which the reproduction of the original flower designs by this lady will prove a task of more than ordinary delicacy.

D. Appleton & Co. will shortly publish a 'History of the Coup d'État,' by M. de Maupas, Prefect of Police; 'Pictures of Life and Character,' from *Punch*, after John Leech (in the Parchment-Paper Series); and 'The Parlor Muse,' a selection from recent *vers de société*.

J. R. Osgood & Co. will issue this month 'Over the Border,' a description of summer travel in Nova Scotia, by Miss E. B. Chase; 'Three Villages,' sketches by W. D. Howells; and 'Song and Story,' by Edgar Fawcett.

Robert M. Lindsay, Philadelphia, will have ready on May 15 a choice edition of 'Jane Eyre,' to be called the "Haworth Edition," in two volumes 8vo, printed from new type on laid paper, and illustrated with eight etchings of the principal places of interest described in the book, as well as with an etched portrait of Charlotte Brontë, by eminent American artists. Add thirty-eight ornamental letters of appropriate design. The edition will be limited to 500 copies.

G. P. Putnam's Sons will publish immediately (by arrangement with John Murray) a 'Memoir of Alice, Princess of Great Britain and Ireland, and Grand Duchess of Hesse,' with a selection from her correspondence, edited by the Princess Christian, a sister of the Princess Alice. The correspondence commences in 1862, the year in which the marriage of the Princess took place, and is complete, without interruption, to the time of her death, in 1880. The volume will contain two portraits. They have also in preparation 'Tableaux de la Révolution Française,' edited, for the use of students in French literature, by Profs. T. F. Crane and O. G. Brun, of Cornell University, with an introduction by President A. D. White; 'Outlines of Roman Law,' comprising its historical growth and general principles, by William C. Morey, Professor of History and Political Science in the University of Rochester; and 'British Orations,' being a selection from the more representative and important orations by British orators during the past century, uniform with 'American Orations,' now in press.

The Cobden Club Prize Essay for 1883 is announced for immediate publication by T. Fisher Unwin, London, under the title of 'The Future Work of Free Trade in English Legislation.' The author is Mr. C. E. Troupe, B.A., of Balliol College, Oxford, and the subject is treated under three heads—Financial Reform, Free Trade in Land, and Monopolies. Apropos of the approaching Wyclif quincentenary, Mr. Unwin will publish on May 1 a little volume, 'John Wyclif, Patriot and Reformer,' written by Dr. Rudolf Buddensieg, of Leipzig, one of the chief living authorities upon Wyclif, and one of the editors of the Wyclif Society. The book will comprise a memoir of the reformer, and also an interesting selection from his writings, translated for the first time from the original Latin MSS. in Dr. Buddensieg's possession and elsewhere. In style the volume will be uniform with the Parchment Edition of 'Luther's Table-Talk,' published by Mr. Unwin last year.

We regret to record the fact that all the papers and material for the second volume of Colonel Claiborne's 'History of Mississippi,' the first volume of which was published in 1880, were recently destroyed by fire in the burning of the author's residence, and there is no hope that the work will ever be completed.

In commemoration of the seventieth birthday of Ernst Curtius, on September 2, it is proposed to present the veteran historian and archæologist with his own bust in marble. A circular addressed to his American admirers, asking their coöperation, has been issued by Mr. George Bancroft, President Carter, of Williams College, and Mr. Robert P. Keep, of the Williston Seminary, East Hampton, Mass.

The Rev. Charles Morris Addison, Arlington, Mass., has been solicited to act as the American representative of the Wordsworth Society, founded four years ago in England, with the aim of promoting the study of this poet, and illustrating by publications his life and writings. The annual subscription is ten shillings, and entitles members to the annual volume of transactions, while membership conveys also the privilege of forwarding literary contributions for reading and consideration at the annual meeting.

Cupples, Upham & Co., Boston, have made a pamphlet of "The Bitter Cry of Outcast London."

Roberts Brothers have issued a cheap edition, in paper covers, of Philip Gilbert Hamerton's 'Intellectual Life'—a work the wide circulation of which is assuredly a public benefit.

'Le Mariage de Gérard,' by André Theuriet, is the latest of the "Romans Choisis" published by William R. Jenkins.

The "Science Ladders" of "N. D'Anvers" have been united in one volume, each retaining its own pagination, by G. P. Putnam's Sons.

Mr. Robert C. Adams's 'History of the United States in Rhyme' (Boston: D. Lothrop & Co.) may have some use as a corrective of the blues, but is otherwise a good book for children to avoid. The exigencies of the author's scheme, in which every line ought to tell, are well exhibited in the following verses:

> "The Seminoles, in Florida,
> By Osceola led,
> For years maintained a bloody war;
> *They slaughtered Major Dade.*"

Mrs. Martha J. Lamb has reprinted from the *Magazine of American History* her series of papers entitled 'Wall Street in History' (Funk & Wagnalls). It is an essentially light and popular retrospect, in which the antiquarian bias of the author predominates as usual over the strictly historical. Still, the volume is worth preserving for reference. Some of the illustrations are curious, and perhaps the earliest are the best.

The first chapter of Mr. Henry Parker Fellows's 'Boating Trip on New England Rivers' (Boston: Cupples, Upham & Co.) is entitled "An Inland Voyage on the Sudbury, Concord, and Merrimac Rivers," and thereby suggests a comparison with Thoreau's well-known log of the same course. In a literary point of view, nothing could be more disastrous; but there might be some slight reward in contrasting the number of obstacles now existing to the navigation of those streams and the number which Thoreau met with. The Housatonic and the Nashua are the other streams essayed by Mr. Fellows, whose narrative is hardly up to the guide-book standard, though its merit is altogether that of the guide-book. The illustrations, from pen-sketches, are of a rather primitive character.

John Wiley & Sons publish a 'Ruskin Birthday Book,' "collected and arranged by M. A. B. and G. A." No modern writer lends himself so readily to the compilation of books and extracts as Ruskin, for his really brilliant and incisive passages of eloquence are jewels of speech, which are often quite independent of the setting in which he puts them, and generally depend more on their verbal form for their force than on any logical connection or agreement with what is said before or after. The book is got up in excellent style, and tastefully bound, and preceded by a fair portrait engraved from a late photograph with full beard.

The *Bibliotheca Sacra* for April prints Dr. Von Holst's inspiring talk at Oberlin last fall on "The Irrepressible Conflict," which is alone worth the price of the subscription. So, to thoughtful minds, but in a different sense, is the paper in the same number on "Heredity and Depravity," by Professor Stuart Phelps. Since its transfer from Andover to Oberlin, by the way, this quarterly has fallen under the management of Professors G. Frederick Wright, Judson Smith, and Wm. G. Ballantine, the senior (formerly associate) editor representing much more truly, we should say, than Professor Phelps the "reconciliation of science and religion."

An unusual number of Massachusetts notables are commemorated in the *New England Historical and Genealogical Register* for April. Passing by the opening paper on the Rev. Edwin H. Chapin, as not adding much to our previous knowledge of its subject, we can mention an interesting memoir of Edmund Quincy, the fourth of his name in direct succession (1681–1738), by his descendant, the late Miss Eliza Susan Quincy; more of Mr. John T. Hassam's researches concerning the descendants of Ezekiel Cheever, the famous master of the Boston Public Latin School; and the latest of Mr. Henry F. Waters's "Genealogical Gleanings in England." These last deal with Sir George Downing and his kindred; with William Hathorne and his brother Nathaniel, ancestors of the novelist; with Pepperells and Phipses; with Simon Bradstreet, and with an ancestor of the Massachusetts Sedgwicks. Mr. Waters has now established "beyond a doubt, whereabouts in 'Our Old Home,' that elder England beyond the seas, we must look for the ancestry of one of the most widely known among the distinguished sons of old Salem." The Hawthorne seat was in Berkshire, near Binfield and Bray, Cruchfield and Oakley Green. But our romancer, unhappily, was denied the pleasure of this recognition.

The first article in the March number of the *Antiquary* is by Mr. A. Lang, who continues here his controversy with Mr. Sayce (in the *Academy*) as to "The Iron Age in Greece." He appears to have established his point, that iron was known and used much earlier in Greece than Mr. Sayce would admit; but it still seems to us to be proper to speak of the Greeks of Homer's time as in the "bronze age"—so far as such a distinction is properly used at all—for it is manifest that bronze was at the time the usual material

for weapons and other implements, iron being known, but not being yet in common use. Mr. Wheatley's second paper on the history of the house treats of "the living rooms," and he notes that the word *parlour*, used in the sixteenth century for "the ordinary living room," has in England been degraded to a room on the ground floor, while in the United States, "I believe, . . . the name parlour is still treated with some respect." This appears to be one of the many instances in which the American colonies preserved the usage which was current in England at the time of their settlement. Mr. J. T. Bent gives some interesting extracts from letters of Philip II., in relation to an invasion of Ireland in 1579-80, "an expedition which had in it all the elements of success, but which, through the want of prompt and generous action, resulted in failure." Mr. Brown continues his sketch of the earlier life of Thomas Cromwell down to the fall of Wolsey and his own establishment in the King's favor. In this important period Cromwell appears to have acted first and mainly for his own interests; but it is added that he, "now that he had made his own position sure, did his best for Wolsey." Other papers are upon drinking vessels in the form of a bear (with curious illustrations), the prisons of Venice, Bishop Parr of Sodar and Man, and church bells of Bedfordshire (illustrated).

From the Johns Hopkins University we have No. 1 of the third volume of "Studies from the Biological Laboratory," containing papers by H. W. Conn, on the significance of the larval skin of decapods, and on the life history of Thalassema; and by Henry Leslie Osborn on the gill in some forms of prosobranchiate mollusca. A number of plates accompany these papers.

Dr. Herbert B. Adams's contribution to vol. i. of Dr. G. Stanley Hall's "Pedagogical Library" has been selected to lead off the second series of the former's "Johns Hopkins University Studies in Historical and Political Science," under the title of 'Methods of Historical Study.' To the consideration of "special methods" is now added a longer chapter on "new methods," partly consisting of the author's social-science paper last September at Saratoga. This valuable survey of the modes in which the study of history is being pursued at various institutions in Europe and America enlarges, as is natural, on the Historical Seminary in Baltimore.

A Philadelphia auctioneer advertises for sale Abbottsford's Waverley Novels. He will probably sell them to the man who lately bought "a descriptive book, published in Latin, of Raymond's opera of 'The Lulli,' bound in heavy glazed sheepskin, and issued in 1651"; or to the other who asked at one of our public libraries for "Charles Kingsley's 'Scouring of the White House.'" Possibly it would be liked by M. Vallée, who, in his 'Bibliographie des bibliographies,' has introduced a M. Neveu in place of M. Forestié, usually styled *neveu*, to distinguish him from his uncle of the same name. But Philadelphia is not alone in having bibliographical novelties to dispose of. A Boston auctioneer was to sell this week a copy of "Xenophon's Cyclopædia."

C. Eichler, 27 Behrenstrasse, Berlin, W., sends us his priced catalogue of casts of ancient, mediæval, and modern sculpture, the availability of which in cheaply endowing our higher institutions of learning with a nucleus of art models is not appreciated as it ought to be.

The fifth half-volume of the 'Handbuch der Theologischen Wissenschaften' edited by Dr. Otto Zöckler, has been issued at Nördlingen (C. H. Beck'schen Buchhandlung).

The Annisquam Laboratory will reopen at Cape Ann on June 20, through the liberality of the Woman's Education Society, and under the direction of the Boston Society of Natural History, as heretofore. The term will close on September 1. The low tuition fee varies with the length of study. Applicants for admission should address Mr. Alpheus Hyatt, Curator of the Boston Society.

— In our recent notice of 'Darwinism as Stated by Darwin Himself,' we expressed a doubt whether Mr. Darwin's family had given their approval to this work. It is now brought to our notice that this may be taken to mean that the compilation was unauthorized, and we have been shown a letter from Mr. George H. Darwin, of October 8, 1883, giving his consent on conditions which have been strictly complied with. It is but just to state, also, that although Mr. Nathan Sheppard does not in his book style himself "Professor," his publishers are quite justified by our American usage in mentioning him by this title, which has been rightfully his in times past.

—The *North American Review* for May contains an article on "Illusions of Memory," by Prof. Henry F. Osborn, who has been carrying on a systematic inquiry into the subject for two years by means of an extensive correspondence. The phenomenon he has undertaken to investigate is familiar to every one, and has been noticed in literature by Dr. Holmes, Walter Scott, Rossetti, Wordsworth, and Hawthorne. The illusion is that something is not new (though we know, or think we know, it to be so), but a repetition of a preëxistent state of fact or state of mind. It may be a scene, or it may be a conversation, and with some persons it may even be a dream; but whatever it is, the consciousness of recollection is imperfect and illusory, for we seem to recall it without being able to recall any of the concomitant circumstances. Scott speaks of the curious "sentiment of preëxistence" accompanying or producing it, and this is a point which Professor Osborn seems to have overlooked. We will at least, for the benefit of all inquirers into this curious subject, throw out the suggestion that this illusive action of memory differs from the ordinary voluntary or involuntary action in the following way: ordinarily, in recalling a fact or event, we seem to ourselves to bring it as a piece of the past into our present consciousness, but we never lose our consciousness of the present as such. Memory in its illusive action reverses this process, and seems to transfer the present scene or conversation, or whatever is going on, to a past consciousness, a sort of mnemonic background which is suddenly revived with such force as to produce that "preëxistent" feeling noticed by Scott. The gentleman who has asked us to suggest this analysis of illusive memory says that in his own case he chiefly notices it in conversations, the illusion being so strong that in many instances each sentence as it is uttered is illusively recognized; but never without the "preexistent" feeling. Professor Osborn seems to think that there is no real difference between incomplete or partial memory and the phenomenon in question, and he believes that in all such cases there is some real basis in the past, which if we could recall it would clear up the mysterious feeling produced. But can this be so when a partly recalled bit of the past—*e. g.*, as in the case of a half-remembered face, or a half-recognized passage from a book—fails utterly to produce the "preëxistent" sensation? This explanation seems inadequate.

—The *Atlantic* for May contains an article on "Matthew Arnold as a Poet," by Harriet Waters Preston. In it she analyzes with a good deal of skill the sources of his inspiration, which in the last resort must be confessed to be chiefly Doubt. If Doubt is the inspiration of the age, then he must divide with Clough the honor of being the most representative poet of our time. She points out, however, what many of his critics overlook, that Mr. Arnold himself discovered, after many attempts with the lyre, that prose was his real vocation, and his prose is the prose of a poet—a poet *manqué*, his enemies would say—clear, pointed, imaginative, well knit. In his essays, however, what his admirers most enjoy is the keen assaults he makes upon the generally accepted intellectual order of the modern world, which he attacked in England because he happened to be an Englishman, but which he would have attacked here had he been an American. This is what made his lecturing trip to this country so odd, for in a genuinely democratic and utilitarian country no one is likely to be so unpopular as a man who attacks prime articles of the democratic and utilitarian faith. The truth is that there was no real knowledge of Mr. Arnold, and very little natural tendency to an appreciation of his writings here, while there was an honest, Philistine desire that he should, as a "visiting Englishman," have a good time, and take back a pleasant idea of this country. The press was always, therefore, under restraint with regard to him, which was not thrown aside except by the Chicago newspapers when they read the *Tribune* hoax—on which for twenty-four hours they gave the "children of light" a faint idea of what they would have said before had they felt it fair to do so. The discovery that they had not been able to distinguish between his style and that of a common penny-a-liner capped the climax, and we doubt if it will ever be really known exactly what was thought about Mr. Arnold in Chicago. Mr. Richard Grant White has an article on "The Anatomizing of William Shakespeare," in which he shows what fools Shaksperian critics often make of themselves by attempting to see too much in a plain matter. But his account of Shakspere makes us hesitate to accept even Mr. White as a final judge. Is there sufficient warrant for the following passage?

"In Shakespeare, nature produced as nearly as possible the supernatural. Springing from nearly the lowest social level, without education, without instruction, without discipline of any kind, with limited means of obtaining knowledge, at twenty-two years of age a poverty-stricken vagabond, by the time he was forty years old he had done that which places him at the intellectual summit of the human race. This he had done with no strong impulse to literary art, no social aim, religious or political, no motive of intellectual ambition, but merely at first to earn his bread, and afterward in the furtherance of an almost sordid desire for money, and for the poor sort of consideration which is awarded to the possessors of money. In all he had his heart's desire. The outcast of the dirty little village returned to live in its largest and handsomest mansion; to have the profitable investment of his money in parish 'securities' accepted, and even solicited, as if it were a favor; to take his place among the notables of the neighborhood, where the meagre annals of his life give us our last glimpse of him standing against the interests of the poor, and on the side of grasping privilege. The world's history has no record of a similar achievement."

As we really know little about Shakspere, and find so much enjoyment in his plays, is it necessary that the scanty outline handed down by tradition should be filled out with such a black portrait as this? Is there no golden mean between making him a demigod and a sordid money-getter and "monopolist"?

—The advertisements of Matthew Arnold's books which so frequently appeared during his stay among us, never, to our knowledge, contained a mention either of his 'Isaiah xl.–lxvi., with the Shorter Prophecies Allied to it,' published in 1875, or of his 'Isaiah of Jerusalem,'

which was issued just before his departure for this country. And yet these little books, with their introductions, are publications of even general interest. The introduction to the older Isaiah, in contradistinction to whom the younger is to be designated the Babylonian, is, in fact, a charming piece of work. Were these books excluded from the lists on account of the heterodoxy which lies in their very titles, as compared with the one superscription of the whole of the canonical book of Isaiah? But this is a heterodoxy from which few of the most learned Bible students of our time—Christians or Jews, professors or divines—are free. Be this as it may, there is nothing more reverent in tone than Arnold's remarks on his two Isaiahs, the respective contemporaries of Sennacherib and Cyrus, unless it be irreverent to couple the name of a Hebrew prophet with that of a Greek bard, as in the following: "From no poetry and literature, not even from our own Shakspere and Milton, great as they are and our own as they are, have I, for my own part, received so much delight and stimulus as from Homer and Isaiah." His admiration of the sublimely ethical spirit which breathes from the glowing words of the original Isaiah and "the great unknown," generally designated as Deutero-Isaiah, is expressed in terms full of pathos and yet not uncritical. Arnold's Old Testament criticism, it is true, is neither original nor profound. He is not a Hebraist, nor does he pretend to be. But he has penetrated, with warm feeling and keen sagacity, into the essence of Hebrew prophetic poetry, and has possessed himself, with clear-sighted discrimination, of the fruits of modern research. His caution in adopting conclusions seductive by their brilliancy is as commendable as it is rare.

—His conservatism in regard to the style in which the book of Isaiah is to be presented in English garb is, perhaps, excessive. He was guided by it when issuing his edition of the last twenty-seven chapters, and he clings to it still, though he acknowledges that he "went too far" when he said that "he would forbear to alter the old version of Isaiah where it made sense, whether the sense made was that of the original or not." His present standpoint is this: "The old version is not to be departed from without necessity. It comes from a great flowering-time of our literature, and has created deep and powerful sentiments; it is still the prime agent on which we have to rely for the attainment of our prime object, that Isaiah may be enjoyed fully. Increase of knowledge enables us to see mistakes in the old version, and to correct them; but only mistakes, real mistakes, should be corrected, and they should be corrected gently." In adherence to this rule, he finds it necessary to make only three changes in the first chapter. In reality, he attempts only a new edition of Isaiah "in the Authorized English Version"—as the title-page of the recently published half has it—with corrections and notes, and not a new translation. He leaves many of the false tense-renderings unaltered, and deems the use of "Jehovah" or "Yahveh," instead of "the Lord," inadmissible in a version intended to be enjoyed by the mass of readers; for "*Jehovah* and *Jahve* have a mythological sound, and to substitute them for *The Lord* disturbs powerful sentiments long and deeply established already." There is much to be said against this latitudinarian view of the rights and duties of translators or editors of writings generally presented and received as sacred, but this is not the place for expatiating on the subject. What we chiefly mean to point out is the sentimental process by which rational criticism is here tempered into harmony with pious clinging to time-hallowed inaccuracy.

—Any "culture question" you can start is sure in advance of plentiful discussion. Both those who are satisfied and those who are dissatisfied with their own training fancy that they have a personal interest in the matter and a right to be heard; and the ball, a very old ball, that Mr. Charles Francis Adams set in motion last summer—it seems an eternity since—has been kicked vigorously backward and forward by feet of every shape, size, and shoeing, and that without lighting once on any new ground. One of the last players of the game is Prof. Louis Dyer, whose daintily printed paper, "The Greek Question and Answer" (Boston: Osgood), contrasts with the business-like simplicity of the garb in which "A College Fetich" appeared, very much as the author's fastidious way of handling the matter is contrasted with Mr. Adams's direct and uncompromising style. Professor Dyer goes in with full conviction—less could hardly be expected of a Grecian—but he does not hurt himself or his cause by over-vehemence. He begins with a good-natured laugh at the "modernists" for insisting so much on French and German, which they do not know, in preference to the Greek they have totally forgotten. As the *Nation* pointed out at the opening of the fray, men are always imagining that they would have learned French and German if they had not been obliged to study Greek; the fact being that those who really master Greek are, in the present stage of culture, almost sure to learn French and German also. Unless we are prepared to acknowledge a radical inferiority of Americans to Germans, it cannot be admitted that there is any insuperable difficulty in acquiring a fair knowledge of two or three modern languages, together with enough Latin and Greek to understand what the Romans and the Greeks mean to modern times. "The French and German substitute for elementary Greek," says Professor Dyer, "is too easy or too hard, and its discipline may always be eluded": too easy, as he explains, because modern languages, in their structure, phraseology, sphere of thought and life, are all too much alike; too hard, because an attempt to substitute higher French and German work for elementary Greek study postulates effort far beyond the learner's power, while the discipline may be eluded by a brief residence abroad. As to the other answer to the Greek question, "Natural Science," Professor Dyer is "far more inclined to come to terms," and frankly admits the importance of the new training; but that new training is needed "to supplement, not to supplant, the old." Literature and science must be insisted on for all, and the Greek answer to the Greek question is, "Greek and science—science and Greek." There remains only one question, that of proportion—unfortunately, as difficult as any. How much science? How much Greek? The problem of proportion was a vital one to the Greek toper, as it is to his modern brother. How much wine to how much water? Shall we pour the wine on the water, or the water on the wine, or blend the two deftly by a simultaneous outpour? Luckily, or unluckily, these culture questions adjust themselves after a little agitation; and educators and theorists, college presidents and Greek professors, have less to do with the result than they are apt to fancy.

—The National Academy of Sciences held its annual meeting at Washington, April 15–18, with the usual attendance of about thirty-five members. For the four public sessions, which were attended perhaps less numerously than in some former years, papers were entered to be read by G. K. Gilbert, T. Sterry Hunt, Simon Newcomb, A. E. Verrill, Ira Remsen (2), Elias Loomis, C. S. Pierce, the same and J. Gastrow, S. P. Langley, J. E. Hilgard (3), E. D. Cope (2), Theo. Gill, the same and J. A. Ryder (2), Geo. F. Barker (2), Geo. J. Brush, H. A. Rowland, B. Silliman, John S. Billings, A. W. Wright, Elliott Coues, and H. L. Abbott. Most of these were read in person or by proxy, and some others were presented, by invitation, by persons not members of the Academy. The Council of the Academy remained after election nearly as before. The mortality among the academicians has been great of late, no fewer than fourteen vacancies having been occasioned by death during the past two years. The membership stood at eighty-nine only when the Academy entered into the yearly election of new members. Those whose names appeared on at least twenty ballots, and on two-thirds of the total number of ballots cast, were five, namely: Edward S. Dana, of New Haven; A. B. Comstock, U. S. A.; Sidney I. Smith, New Haven; W. K. Brooks, Baltimore; C. E. Dutton, U. S. A., who were accordingly elected members of the Academy. This gave three to the physico-mathematical and two to the biological wing of the Academy; mineralogy, geology, engineering, invertebrate zoölogy, and embryology being the more special subjects represented by the new members. The general representation of the different departments of science has not materially altered of late years, and the policy of the Academy continues much the same.

—The *Messenger of Europe*, the largest and best managed among the Russian monthlies, furnishes in the first two numbers for 1884 (the nineteenth year of its existence) several valuable contributions of general interest. A reproduction of Turgeneff's portrait, after a water-color drawing made in 1839, is not exactly a work of art, but in comparison with late photographs it shows how much had been preserved of youthful traits even into the sixties, and P. V. Annenkoff's account of the young poet's life from 1840–1856 is a fine revelation of the development of this remarkable man. For many years the opening pages of the January number have been set apart for Turgeneff. Last year he sent "Clara Milich," the last tale from his pen, but with the request that it should be placed second after some till then unpublished verses by Pushkin which had come into his possession. This year the editor has in a sense still filled the first pages as of old, with the portrait frontispiece just mentioned, and the succeeding poem, "On a Turgeneff Theme," by Andreyevski, inspired by the sketch entitled "Enough!" Turgeneff's contemporary, F. Dostoyevski, is discussed in a review of his recently-published biography and correspondence. The "long-suffering poet" who, after ten horrible years spent in the prisons of St. Petersburg, in the mines of Siberia, and in exile, was forced to earn his living by writing novels, often mentioned with envy his fortunate friend Turgeneff, though he always willingly admitted Turgeneff's superiority. Since Dostoyevski, by the way, is so little known among the English reading public, we wish to call attention to the elegant German translation of his 'Crime and Punishment,' translated by Wilhelm Henckel, with the name of the hero, Raskolnikoff, as title (Leipzig, 1883). While few will be pleased with Dostoyevski's characters, they are, in their way, not less true than Turgeneff's, and the remarkable psychological problems will excite the deepest interest. Alexander Pypin, the celebrated author of the history of the Slavic literatures, contributes new studies on the popular element in Russian literature. Among the poems, those of Starostin show great talent, though we are surprised to see that the editors

of the *Messenger* did not recognize the first of the poems as a mere translation (but a very able one, indeed) of Goethe's "Zueignung" to 'Faust.'

—It has always been one of the principal aims of the *Messenger of Europe*—as its title suggests—to make the Russian public acquainted with the newest products of European literature. Of late that programme has been enlarged, and due attention is also paid to our American authors. Thus, we noticed last year a translation of Cable's 'Belles Demoiselles Plantation,' together with an interesting essay on Cable and his position in American literature; and the two numbers of the *Messenger* before us contain an admirable translation of Henry James's 'Siege of London.' In the department of reviews we meet with a prospectus for a complete edition of Shakspere's works in Russian, by A. Sokolovski. "Hamlet" has already appeared (the seventh complete translation of this tragedy), and others are soon to follow. Under "Domestic Politics," the condition of the peasantry and various proposals for its amelioration still form the main topic. Let us hope that before long the best of these theories will be more energetically put into practice than heretofore.

—The *Bulletin de Correspondance Hellénique* for March contains, among other articles, one of great interest on some Greek vases found at Marseilles while digging a dock. The illustrations to the article show two forms of *oinochoë*, with a ground plan of a portion of an ancient cemetery exposed by the excavations M. Albert Dumont classes these vases with those found at Melos, at Mykenæ, and in general among the Cyclades, while he relates them to those found at Hissarlik and Santorin. They are, however, according to M. Dumont, of the end of the fourth or of the third century B. C., although the vases found at Melos and Santorin, to which they are related, are supposed to be the earliest Greek ceramics known. The fact is that in these manufactures the types survived for centuries, and some still in use are found in excavations of the most archaic material. In excavating the oldest part of Gnossos, a quantity of oil-jars were found, which, when shown to the inhabitants, were greeted with utter derision, and the excavators were accused of hiding modern oil-jars, to be dug up as antiques, so perfectly were they reproduced by the jars of present manufacture. The water-jars borne on the shoulders of the youths in the frieze of the Parthenon may be seen to-day in some of the Greek islands, employed for the same purpose and carried in the same way. When we know that the plough of Hesiod and the loom of Penelope are still in use in the greater part of the classical world, we need not be surprised to find vases of the most archaic form in tombs of the fourth century. The *Bulletin* contains also an important illustrated article on the monuments found at Delos, by M. Reinach, and an article on the recently-found inscriptions relating to the accounts of Eleusis, by the director of the School, M. Foucart.

—New York concert audiences are, as a rule, quite undemonstrative compared with those in some foreign cities. This is true in regard to solo as well as orchestral performances, and it strikes one occasionally as odd that a favorite singer who, at the opera, is recalled again and again, should not get enough applause at a concert to cover his exit. On extraordinary occasions, however, this apathy is cast aside, and such an occasion was the last rehearsal and concert of the Philharmonic Society, when Herr Scaria made his first appearance in New York. No singer has ever won a more immediate and emphatic success, and the fact that we have had no first-class bass singer here for years makes it especially pleasing to record this success. Herr Scaria was recalled again and again, amid enthusiastic applause and bravos, until he must have imagined he was back in Vienna, which has the most demonstrative audiences in the world. In him the audience made the acquaintance of a basso who, more than any other male singer, has realized the meaning of Wagner's vocal method. To hear him sing "Wo berg' ich mich" from Weber's "Euryanthe" (the starting point of the "music of the future"), and, still more, Pogner's Address from "Die Meistersinger," is to hear, not only a beautiful vocal instrument, so to say, but a speaking vocalist—that is, an artist who enables the audience to enjoy not only the music but the poetry at the same time. This is a matter of tremendous significance. In Italian operas, and in most German operas previous to Wagner, the vocalists take very little pains to pronounce the words distinctly, and the librettos generally are so silly that the audiences are only too glad to ignore them entirely. The music is, therefore, exclusively *instrumental*, for the vocal cords of man or woman constitute a physical instrument just as much as a clarinet or an organ pipe. In Wagner's operas, on the other hand, a vocal style is chosen which obliges and enables the singer to pay as much attention to the poetry as to the melody; and as his librettos are impressive and well constructed dramas in themselves, the gain is immense. He gives us *two* arts in place of but one, even in the concert hall, apart from action and scenic surroundings. Wagner himself fully appreciated the manner in which Herr Scaria realized his ideal, singing not only with his vocal cords, but with his head and his heart as well; for he does not memorize the text like a parrot, but studies its meaning and gives utterance to the feelings embodied in it. To judge such an artist with reference to the vocal cords alone would be to show a lamentable misconception of what the essence of music is. If Mme. Patti sings out of tune (and she *does* sometimes, persistently), we lose everything, for she gives us only beauty of tone and execution, and no fine poetry. But if a Wagner interpreter makes a technical mistake we lose only a small proportion of that which constitutes his art. Herr Scaria may be safely judged even from the Italian point of view. No other living bass has such a rich, sonorous, broad, smooth, and thrilling voice; and while in Wagnerian melodious declamation it is unrivalled, it is almost equally effective in cantabile of greater rhythmic regularity. The Philharmonic audience which applauded Herr Scaria with such unusual enthusiasm, felt vividly wherein his power lay; and if they will reflect on the points here suggested, they will be able to realize the significance of dramatic vocalism, and to understand why Wagner's operas have driven those of the old school from the stage in Germany.

LORD LYNDHURST.

A Life of Lord Lyndhurst, from letters and papers in possession of his family. By Sir Theodore Martin, K.C.B. London: John Murray. 1883.

"CALL no man happy until his death," says the simple wisdom of ancient Greece. "Call no man happy," adds the ripe experience of modern England, "until you know who has been his biographer." Of biographical good and bad fortune Lord Lyndhurst has had more than his share. In one respect he was fortunate beyond his deserts. It was a happy day for the fame of John Singleton Copley when Lord Campbell published a libel entitled a 'Life of Lord Lyndhurst.' There were, it is true, facts about his lordship's career not calculated to raise his character among a generation who admired the genius and dignity of the aged ex-Lord Chancellor, and had forgotten the dubious features of Copley's manhood or middle age. And upon these discreditable facts Campbell dwelt with all the malignity of a mean man, who had suffered under the patronage and kindness of a brilliant rival. But Campbell's attack missed its mark. Malignity was apparent in every line.

"The Life of Lord Lyndhurst," wrote Chief Baron Pollock, "is a most disgraceful production. It is written with the utmost possible malice and ill-will; it rakes together all the scandal and falsehood that was ever invented or written about Lord Lyndhurst. It is dishonestly publishing as true what is notoriously false, and insinuating by a sneer matter for which he [Campbell] knew there was no pretence whatever. It is a biography written for the express purpose of degrading and vilifying a great man, whom he hated chiefly because he was aware he was largely the object of that man's contempt."

The public took the view expressed, with the exaggeration of friendship and partisanship, by Chief Baron Pollock. Lyndhurst had followed to the letter the advice given by an aged historian and controversialist to a young man, who complained of the detraction of theological or political enemies—"Survive them." Some men outlive their fame. Lyndhurst outlived his infamy. He was in 1860 the last and grandest survivor of a generation of political heroes. Every one could see that Campbell was by nature a slanderer and a liar, and it was easy and pleasant to conclude that everything said by him against such men as Brougham or Lyndhurst, whose very vices were better than his virtues, was a slander and a lie. No conclusion could better have served Lyndhurst's reputation. By the rarest good luck, the invectives of an unscrupulous enemy had in his case all the good effect which could result from the eulogies of disinterested friendship. If only Sir Theodore Martin could have left well alone, Lyndhurst might have been called happy.

But the blessing of Lord Campbell's detraction has now been more than balanced by the curse of Sir Theodore's apology. To write the apology of a slandered hero is always an act of dubious wisdom. Excuses are in such a case emphatically accusations, and at the very best an apology recalls to men's memory that there was something in a man's life which needed defence. Most of us had forgotten that the venerable peer who, in his ninety-second year, commanded universal admiration, had been a turncoat. To revive this disagreeable recollection was at best a poor service to Lyndhurst's memory. The only vindication for raking up old accusations could be the possibility of showing them to have been essentially false. The question which every student of Martin's 'Life of Lord Lyndhurst' must candidly and carefully ask himself is, whether the author has succeeded in showing that the imputations under which Lyndhurst suffered were groundless. We answer with confidence that there never was a defence which more completely broke down than Sir Theodore Martin's apology for the career of Lord Lyndhurst. Such success as it may for a moment have with readers unversed in historical controversy will arise from their not observing that Sir Theodore makes his own opinion of his hero pass for evidence of that hero's real character; and, moreover, to save Lyndhurst from the weight of an accusation which he, it may be suspected, bore lightly enough, imputes to men such as Lord Denman either inconceivable ignorance or still more inconceivable mendacity. This, be it remarked, Sir Theodore Martin does

without in reality bringing a single important new fact, as to Lyndhurst's career or character, before the public. He virtually assumes that the charge made against Lyndhurst was false, and that a politician whom we venture to say no one, friend or foe, held during his lifetime to be a statesman of high (political) character, was in effect a man who always acted politically on the highest principles.

Let us see exactly what the substantial charge against Lyndhurst was. It can be described very simply. What men like Lord Denman said was, that Copley, till between the age of thirty and forty, was known among all his friends as what we should now call an advanced Liberal, and that he suddenly, on the invitation of Lord Liverpool, threw over his known principles, and came into Parliament as the nominee of the Tory Government. Having once taken a side, he played with great success the part of a Tory partisan or leader. The true gist of the accusation is not that he played the game recklessly, though this was true of some parts of his career, not that he played it dishonorably, but that he treated politics as a game, and, when his friends were giving up all hopes of place for the sake of their principles, took that side, in what seemed to him a mere game, which he held likely to win, and betrayed the fact that he either did not know what political principle meant, or was willing to throw over principle in order to gain wealth and power. To say that Sir Theodore Martin does not disprove this charge is gravely to understate the extent of his failure. His own book is almost enough to establish in substance the truth of the accusation brought against his hero.

The evidence against Lyndhurst is excessively strong. The best, and in such a case almost the only, proof of what were known to be a man's opinions in early life, is the report of friends who must have known the facts, and whose character is a guarantee that they do not willingly misrepresent them. No boldness of assertion can dispose of the language of such a man as Denman. In private, in public, and to Lyndhurst's face, he asserted that the latter was, till at least the age of thirty, known to his friends as a Liberal. Our space prevents us from quoting the once celebrated debate in which Denman charged Lyndhurst before the Peers with political apostasy. But we venture to say that whoever reads the language of the Chief Justice will feel sure that Denman was, both before and after the debate, firmly convinced that the charge was true, and, further, that he had good reason for the conviction. Denman, it must be remembered, spoke out plainly what scores of Lyndhurst's associates both said and believed. Lyndhurst was impelled by every possible motive to deny and dispose of a most damaging imputation. Had he really contradicted his assailant, we should still say that if universal report and Denman's word were to be weighed against Lyndhurst's official assertions, it was, as a matter of evidence, the probable conclusion that Denman spoke the truth. But Lyndhurst does not really contradict his accuser. Denman's assertion was, that, holding Whig principles, Lyndhurst became a Tory placeman. Lyndhurst in effect replies: "I don't precisely recollect what my principles were, but I can assert that I never belonged to any party or political society whatever. I never embarked in politics, and I never wrote a political article on either side of any question which might have been agitated. This was my conduct till I came into Parliament twenty years ago."

These words one may believe to be strictly true. A man may have held Whig principles, may have been known to all his friends to be by conviction a Whig or a Democrat, and yet may never have joined any political society, or have written an article on any political topic. Lyndhurst's defence, in short, as put by himself, is at bottom not that he never held Liberal or Democratic opinions, but that, never having committed himself to any political party, he had a right to take whichever side in politics suited him best. If he then played the game fairly, his own conscience as a man of honor was satisfied. With the idea that politics was not to be treated as a game at all, Lyndhurst had at no period any sympathy whatever, and his real defence, as far as an apology can be made for him, is to be sought in a direction toward which Sir Theodore Martin has hardly turned his attention. Lyndhurst's view of politics was shared by the majority of politicians in the early part of George the Third's reign. Lyndhurst was over thirty when he joined Lord Liverpool's Government. He retained, we may fairly suppose, the feeling of the generation among whom his youth had been passed. He acted in a way which would have excited little attention and have incurred little blame from men of the world in, say, 1780 or 1790. What was peculiar in Lyndhurst's position was, that the feeling among the best men of the day with regard to political principle had been for twenty or thirty years gradually changing. In 1815 or 1820 men were prepared to blame conduct which would have met with no great reprobation thirty years earlier. In 1830 and 1835, the moral tone of public life had risen still higher. The best Whigs and the best Conservatives could not understand how any man of intellect or of honor could look upon politics as a game to be played mainly with a view to achieving personal success. In this gradual change of public sentiment Lyndhurst did not share. His commanding intellect and his dignity of manner concealed from others, and perhaps from himself, the thorough want of seriousness which characterized his public career. We may well believe that he did not in politics violate any rule which he held binding on a man of honor. If he had publicly joined the Whigs, he would probably have stuck to them more consistently than did Brougham. He knew what was meant by party loyalty. But of politics as a matter of principle he had no conception whatever.

This view of his character is not the product of Whig animosity. It has been entertained and expressed by persons whose opinion no one dares to treat with disrespect. No one dares to question the moral insight of Frederick Denison Maurice, and this is how he writes in 1840 (when he was thoroughly out of sympathy with the Whigs) of Lord Lyndhurst: "The candidates [for the post of Lord High Steward, at Cambridge] are Lord Lyndhurst, the cleverest of turncoats, and the very ideal of able, unprincipled Conservatism; the other, Lord Lyttelton, a young man of Whig connections, in his character earnest and sincere, and with an intellect of the highest promise." Add to this the comment of Maurice's biographer:

"Lord Lyndhurst was at that time [1840] leading in the House of Lords an Opposition as different in character from that of Sir Robert Peel, as two forces allied in opposition to a Government could well be. In my father's view, Peel was defending what he himself at all events believed to be valuable institutions. Lyndhurst was defending what he knew to be abuses, simply because he could thereby get a majority."

No one can deny either the moral impartiality or the intellectual insight of Walter Bagehot. Let the reader then weigh the full weight of this passage from Bagehot's estimate of Lyndhurst:

"Few men led a laxer life; few men, to the very end of their life, were looser in their conversation; but there was no laxity in his intellect. Everything there was braced and knit. Great oratory is but a transitory art; few turn even to the best speeches of the past, and even the best of these are so clogged with the detail of the time that they are dull and wearisome to a hasty posterity. Few will recur to Lord Lyndhurst's speeches, but those who do so will find some of the best, if not the very best, specimens in English of the best manner in which a man of great intellect can address and influence the intellects of others. Their art, we might almost say their merit, is of the highest kind, for it is concealed. The words seem the simplest, clearest, and most natural that a man could use. It is only the instructed man who knows that he could not himself have used them, and that few men could. Such was the great man whom we have just buried—great in power, but not great in the use of power; a politician, not a statesman; a man of small principle and few scruples. Of him, far more truly than of Burke, it may be said that 'to party he gave up what was meant for mankind.' He played the game of life for low and selfish objects, and yet, by the intellectual power with which he played it, he redeemed that game from its intrinsic degradation."

THE NEW ENGLISH DICTIONARY.—II.

A New English Dictionary on Historical Principles; founded mainly on the materials collected by the Philological Society. Edited by James A. H. Murray, LL.D., President of the Philological Society, with the assistance of many scholars and men of science. Part I.—A—Ant. Oxford: Clarendon Press; New York: Macmillan & Co. 1884.

It is not on grounds like those mentioned in our former article that we should criticise this dictionary, so far as we are disposed to criticise it at all. The fault we should find with it is that there has been neglect, comparatively speaking, of authors of the highest class, and too much prominence given to those of an inferior grade. It would be perhaps ungracious for an editor to refuse wares from whatever quarter brought, or to discourage enthusiasm to whatever quarter directed; but a reviewer may be justified in expressing surprise of a mild type at the taste which has selected some of the works that have been read for this dictionary. The illustrative quotations are, for men engaged in the profession of writing, perhaps the most important part of any lexicon. It is always desirable to ascertain the usage of an age; but it is the usage of its best authors we wish, and not of its poor or poorest ones. To record that best usage is a main duty of any dictionary. If, for instance, a word is employed in the same sense by Tennyson and the author of the 'Letters to the Joneses,' there ought not to be the slightest hesitation as to the writer from whom the quotation is taken. In the one case, the authority for the usage is of the highest kind; in the other, the selection chiefly shows that the word existed at the period indicated. We fear that, under a mistaken idea of exercising a catholic spirit, the editor has at times been tempted to reject an illustrative example from a great writer, and put in its place one from some writer whose name is little known, or which, if known, carries but little weight. We could certainly furnish many instances of the neglect of the former, whether due to accident or design. We go further: The use of a technical word by a great writer ought ordinarily to be recorded in preference to a similar use by a specialist. Goldsmith, for instance, uses *anastomosis* ('Citizen of the World,' Letter xviii.); and his employment of it is more worthy of record than any here given, because it denotes a tentative transition of the word from the language of anatomy to that of pure literature.

It is from this comparative—we do not say actual—neglect of writers of literature pure and simple, that words and usages found in the very writings which have been read for this

work have in some cases not been recorded. An editor is, of course, largely at the mercy of his readers; but to some extent he can control them, for he can insist upon the great authors being read with special care. We shall give instances of omissions that have come under our own observation, sedulously avoiding any that we have happened to see noticed elsewhere. Chaucer uses *alone* in the sense of 'devoid of,' where he describes Cryseyde as "alone of any friend"—a usage not here recorded. Nor is *age* found in the sense of 'an old man,' a meaning given it in Marlowe's "Faustus" (act v., sc. 3, 4to of 1604); nor again in the sense of the Latin *lustrum*, which it bears in Ben Jonson's "Alchemist," where Sir Epicure Mammon tells a disbeliever that the elixir of life will restore the possessor "to the fifth age." Nor is Surrey's division of life into three "ages" placed among the illustrative quotations. Of compounds we notice the absence of *angry-sounding*, applied to the drum in Peele's "Farewell to Norris and Drake"; of *all-witted*, applied to a lady in Ben Jonson's "Every Man Out of his Humor"; of the sense of *almond-flower* in Peele's "David and Bethsabe," where he speaks of "water mixed with purest almond-flower." In the last-named author's "Clyomon and Clamydes," *ames*, a word occurring in the expression "God's ames," is not recorded: nor is the use in this drama of *a* meaning 'I'; nor the same word with the possible sense of 'thou,' which latter Dyce gives as certain. A use of *Alpha* without 'Omega' as a name for God, which appears in Greene's "Friar Bacon and Friar Bungay," is not included. More remarkable is the omission of a word occurring in one of the classics of our literature. Dryden, in his great political satire of "Absalom and Achitophel," speaks of *Adam-wits*; but this word, which most readers find to need explanation sorely, is not contained here, though other compounds of 'Adam' are. Again, in this work under *Æolian* there is the definition of 'Æolian harp'; but nobody could get from anything said under "Æolian" hardly even a suggestion of what Gray meant in the opening line of the ode on "The Progress of Poesy":

"Awake, Æolian lyre, awake."

Again, *alfresco* is given here as an adverb; but there is nothing to indicate such a usage as is found in Scott's "Fair Maid of Perth," where he makes the Duke of Rothsay say, "I love the al fresco of the river."

A closer attention paid to works of pure literature would, moreover, have shown occasionally forms earlier or later than those given or indicated here. *Amazonian* in the sense of 'Amazon' is found in Marlowe's "Tamburlaine"; *Adonai* occurs in the writings of both Greene and Peele; *anchovies* (with the spelling 'anchouies' in the folio of 1616) is found in Ben Jonson's "Cynthia's Revels"; *achive* for the sake of the rhyme appears twice in "Clyomon and Clyamedes"; and the form *aconiton*, following the Greek, is seen in Lodge's "Euphues Golden Legacie."

This last reference leads us to mark the omission of illustrations of the peculiar language of Euphuism, or of any record of its fanciful herbs and minerals. We are not disposed to affirm that these should be included, yet it is hard to say why a dictionary which registers a fabled plant like *alimon* should hesitate about adopting specimens of Euphuism such as are seen, for instance, in the following quotations, which we take from Greene's "Dorastus and Fawnia":

"The tree *Alpya* wasteth not with fire, but withereth with the dew."

"The herb *Anita* growing higher than six inches becometh a weed."

The peculiarity of the words and forms noticed here as having been omitted is that they occur in the very works which other quotations show have been read for this dictionary, and that they come so largely from writers holding high literary position. The editor, dependent as he is upon the services of volunteers, can hardly be held responsible for the failure to record them; but in the admission of new formations he subjects himself to a certain degree of criticism for his own course. The principle that should be adopted in regard to these seems to us plain. Everything which is likely to be met with widely in the present time, or met with at all in coming times, ought to be included. Every non-technical word, therefore, used by a great master in any department of intellectual effort ought to be recorded; but it is idle to attempt to collect the numerous formations of the hour, which never stray beyond the newspaper columns or books where they originate, which have no more circulation in speech than a leaden coin has in currency. No dictionary can record all, and the addition of any merely swells its size without increasing its value. The only justification for the insertion of any such terms is either some peculiar happiness in their formation, or the fact that they express with precision a thought or feeling that has never been expressed before. On this principle we should, therefore, throw out in this work, on the authority given, such words as *abjective*, *academize*, *acclaimer*, *aladdinize*, *allegedly*, and about a dozen more. There is less reason for their introduction because in nearly every case they are either self-explanatory or explanatory from the context.

So much for the words included in this work. The definitions are in general so full and so excellent that we need here only to call attention to a very few that seem to us to require revision. The third definition of *absinthe* is obscurely expressed. It is impossible to tell from its form whether the word 'none' contained in it refers to the wine and wormwood, or to the wine alone, or to the wormwood alone. Of course, if the reader knows the fact, he will not need to consult the dictionary. We venture to suggest also that the second meaning given to *abider*, 'one who sustains an attack or stands his ground,' is not altogether a satisfactory interpretation of the sense in which Sidney and Raleigh employed it in the two quotations given. In both cases it is not the power of resistance but of persistence that is expressed. It was the special characteristic of Sidney's horse-soldier that he could endure longer than the foot-soldier; and it was on account of their staying qualities that Raleigh attributed to the Lacedæmonians their likelihood of success. Nor can we quite accept, at least as an invariable rule, the distinction laid down between the adjective terminations *-ic* and *-ical*, when the same word appears with the two endings coexisting. It is a discrimination of usage to which the language is perhaps tending; but it can hardly be said to be one that has been finally reached. It is utterly inapplicable, for instance, to *politic* and *political*; and the difference, on the other hand, between *fantastic* and *fantastical* is too vague to be defined, if in many uses it can be said to exist at all.

It is natural, also, that in recording American usage the dictionary should make some errors. We are not referring to significations which occupy the hazy border-land between slang or dialect and established usage, but legitimate meanings which come directly within the province of any English dictionary whatever. It is not that erroneous assertions are made, but omissions occur which would lead to erroneous conclusions. *Administration* is not at all with us, as here defined, "the executive part of the legislature." *Alderman* signifies, according to this dictionary, "a magistrate in English and Irish cities." We have heard of inhabitants of American cities who would feel no regret if this implied limitation to the British dominions were true. *Album* is given, on Webster's authority, as "a book at public places in which visitors enter their names." The fact that this definition does not appear in Worcester might have spared us the additional comment that "this in England is called a *Visitors' Book*." We dare not say that Webster is wrong, and that this use of *album* does not occur among the fifty millions, and perhaps often; but it has never been our own fortune to meet with any other term than 'Visitors' Book,' which is here implied to be the English usage in distinction from the American. While on this subject, we may observe that a use of *admire* peculiar to parts of this country is not recorded. This is the sense of "to like very much," as given by Bartlett. One singular result of this omission is that a quotation from Miss Alcott's 'Little Women'—"I admire to do it"—is placed under the meaning of 'wonder.' We may also point out here one or two slight typographical errors. Under *abdicated* and *absence*, Mr. Howells's name appears as W. D. Howell. A certain sort of compensation is made for this, however, by adding the omitted *s* to Mr. Bristed's name under *Academician*.

We point out these mistakes and make these criticisms in no censorious spirit. All that we have observed ourselves, all that we have seen noticed by others, do not shake in the slightest our confidence in the great excellence of the work, and the thoroughness and ability which have marked its execution in almost every respect. Errors there must inevitably be in the details of an undertaking so vast; but though, when considered by themselves, they may seem numerous, when placed side by side with the positive merits that show themselves on every page, they sink into an almost contemptible insignificance. The work, when completed, promises to be one of the greatest achievements of English scholarship; and it is a sufficient justification for any criticism of details that what is so good ought to be made as nearly perfect as human liability to error will permit. We have not left ourselves space to speak of several other points which deserve attention. It is sufficient, however, to say in conclusion that the work will be of benefit in countless ways not directly contemplated. Its immense array of facts will tend steadily to overthrow the lingering superstition about the sacredness of the present spelling. For English orthography, indeed, the editor, like all historical students of our speech, hardly takes any pains to conceal his contempt, especially as he is under the necessity of pointing out in numerous instances the blunders which caused words to take the form they now have. The completed work, moreover, with its historical statements and literary quotations, will form an impregnable defence against the noisy pests of the period, the smatterers in language, who, through the medium of newspapers and widely-circulated manuals, persistently inflict upon the half-educated their own crude conceits about the forms and uses of words. These and other benefits which we cannot specify here will render the work a desirable possession for all; but to the special student of our tongue it will be absolutely indispensable.

FRANCIS BACON.

Bacon. By Richard W. Church, Dean of St. Paul's. [English Men of Letters. Edited by John Morley.] London: Macmillan & Co.; New York: Harper & Bros. 1884.

We should not have selected the biographer of

St. Anselm and the prime essayist upon Dante for a sketch of the life and character of Bacon. But the result approves the wisdom of the choice. A more interesting narrative, a more truthful delineation of events and character, and a more unbiassed judgment we cannot expect to have. Although "the affectionate care and high intelligence and honesty with which Mr. Spedding has brought together and arranged the materials for an estimate of Bacon's character" have made the compilation of the present narrative easy and simple, the presentation, by an English writer, of Bacon as he was, may not be altogether a welcome task—such is still the glamour of his name. We can well understand that it was to M. de Rémusat's work that we had to look for "the most complete and the most just estimate both of Bacon's character and work."

It is a pathetic story which we read: a life of high gifts and aspirations, and of wonderful failures—failure in life because Bacon had not a soul responsive to the call of honor; in natural philosophy, because he had not a scientific mind. In life he fell ignobly because he did not do his simple duty; in science he failed gloriously, attempting great things which he was unable to perform. We date Bacon's fall from the time when he took a brief against his friend Essex, and count it a more deplorable fall than that from the bench. For in the taking of gifts from suitors in his court he seems to have given in to a custom of the time, and to have suffered through a malice which knew how to turn a righteous popular indignation to the gratification of an old grudge. But it is impossible to believe that he could have been sustained by custom when, holding no office under the crown, he zealously helped to bring to the block the head of the friend who had faithfully served him, and all for an offence perhaps little worse than the getting up of a row. An equal zeal directed toward the condonation of the offence might perhaps have better pleased the Queen and more effectually furthered Bacon's controlling object. It might have saved Essex's life; it would have saved his own honor.

How or why it was that Bacon was put forward, out of course, as the prominent counsel for the prosecution against Essex, under Coke, the Attorney-General, we can only conjecture. The wonder of it is that "it does not appear that he thought it strange, that he showed any pain or reluctance, that he sought to be excused. He took it as a matter of course." He did his work so zealously that when, through some blunder of Coke's in the presentation of the evidence, the trial was at the moment inclining in favor of the prisoner, "Bacon, Mr. Spedding thinks, out of his regular turn, stepped forward and retrieved matters." Dean Church calls attention to the fact that "Bacon's legal position was so subordinate a place that there must have been a special reason for his employment. It is difficult to avoid the conclusion that, on the part of the Government, Bacon was thus used for the very reason that he had been the friend of Essex." If Bacon had not the penetration to see this, he was in that instance neither the "wisest" nor the "brightest" of mankind. If he had this penetration, one cannot well deny that Pope's third and damnatory epithet was applicable, although our author deprecates it as unfair. More weighty and worthy than Pope's flippant line is our author's restrained but decisive judgment of this whole transaction, of which we give the material portions:

"The question was not whether Essex was guilty. The question for Bacon was, whether it was becoming in him, having been what he had been to Essex, to take a legal part in proceedings which were to end in his ruin and death. He was not a judge. He was not a regular law officer like Coke. His only employment had been casual and occasional. He might, most naturally, on the score of his old friendship, have asked to be excused. Condemning as he did his friend's guilt and folly, he might have refused to take part in a cause of blood, in which his best friend must perish. He might honestly have given up Essex as incorrigible, and have retired to stand apart in sorrow and silence while the inevitable tragedy was played out. The only answer to this is, that to have declined would have incurred the Queen's displeasure; he would have forfeited any chance of advancement; nay, closely connected as he had been with Essex, he might have been involved in his friend's ruin. But inferior men have marred their fortunes by standing by their friends in not undeserved trouble, and no one knew better than Bacon what was worthy and noble in human action. The choice lay before him. He seems hardly to have gone through any struggle. He persuaded himself that he could not help himself, under the constraint of his duty to the Queen; and he did his best to get Essex condemned. . . . .

"Bacon had his public duty: his public duty may have compelled him to stand apart from Essex. But it was his interest, it was no part of his public duty, which required him to accept the task of accuser of his friend, and in his friend's direst need calmly to drive home a well-directed stroke that should extinguish chances and hopes, and make his ruin certain. No one who reads his anxious letters about preferment and the Queen's favor, about his disappointed hopes, about his straightened means and distress for money, about his difficulties with his creditors—he was twice arrested for debt—can doubt that the question was between his own prospects and his friend; and that to his own interest he sacrificed his friend and his own honor."

Bacon and James I., Bacon Solicitor-General, and Bacon Attorney-General and Chancellor, are the titles of ensuing chapters of this most interesting narrative, from which we resist the temptation to make extracts; and from that entitled Bacon's Fall we will make as few as possible. Mr. Church's view of Bacon as the King's counsellor is that, granting his fundamental adhesion to the "idea of absolute royal power and prerogative," "when it came to what was wise and fitting for absolute power to do, in the way of general measures and policy, he was for the most part right." Nevertheless, "knowing all that he did, thinking all that he thought, [he] was content to be the echo and the instrument of the cleverest, the foolishest, the vainest, the most pitiably unmanly of English kings." Bacon as a judge—such were the days in which he lived—may perhaps be taken nearly at his own estimate, when he declares, "I was the justest judge in England these fifty years," qualifying this with the admission, "But it was the justest deed in Parliament that was these two hundred years." As to his misdoings—in view of his opportunities and the customs of the time—like a famous Indian general and statesman, he may upon reflection have been astonished at his own moderation. He was not the "meanest of mankind" who could thus recognize the essential justice of his overthrow, knowing the while, as he probably did, that the wrathful storm was not raised in view of his misdeeds, but was made to break upon his head by skilful and malicious direction. His abjectness at the trial seems unmanly, but should count to his credit.

"Bacon's life was a double one. There was the life of high thinking, of disinterested aims, of genuine enthusiasm, of genuine desire to delight and benefit mankind, by opening new paths to wonder and knowledge and power." The philosophic life certainly was a noble ambition, an early-formed and a persistent endeavor. Was it a success or a failure? The answer to that question very much depends upon whether Bacon is judged by what he had the genius to undertake, or by what he had the ability to accomplish. His countrymen nearly down to the present generation have assumed that he accomplished what he undertook, or showed the way for others to do it, and have exalted him accordingly. In our days the most competent judges have reached the opposite conclusion, and Bacon's services to science, having been vastly exaggerated, are in danger of being unduly disparaged. The present biographer has collected and with excellent judgment represented the *consensus* of scientific opinion. He admits that even if we regard Bacon as "the parent of modern science, his methods contributed nothing to its actual discoveries, neither by possibility could they have done so." He notes "the depreciatory opinion of a contemporary like Harvey, who was actually doing [as still more was Galileo] what Bacon was writing about." He frankly adopts the conclusions of Bacon's most loyal and affectionate editors, Ellis and Spedding, that he "failed in the very thing upon which he was most bent, the discovery of practical and fruitful ways of scientific inquiry." Mr. Ellis hits the blot when he says that "absolute certainty and a mechanical mode of procedure, such that all men should be capable of employing it, are the two great features of the Baconian system." And so does our author, in the following:

"He had a radically false and mechanical conception, though in words he earnestly disclaims it, of the way to deal with the facts of nature. He looked on them as things which told their own story, and suggested the questions which ought to be put to them; and with this idea half his time was spent in collecting huge masses of indigested facts of the most various authenticity and value; and he thought he was collecting materials which his method had only to touch in order to bring forth from them light and truth and power. He thought that, not in certain sciences, but in all, one set of men could do the observing and collecting, and another be set on the work of induction and the discovery of 'axioms.' Doubtless in the arrangement and sorting of them his versatile and ingenious mind gave itself full play; he divides and distinguishes them into their companies and groups, different kinds of Motion, 'Prerogative' instances with their long tale of imaginative titles. But we look in vain for any use that he was able to make of them, or even to suggest. Bacon never adequately realized that no promiscuous assemblage of even the most certain facts could ever lead to knowledge, could ever suggest their own interpretation, without the action on them of the living mind, without the initiative of an idea. In truth he was so afraid of assumptions and 'anticipations' and prejudices—his great bugbear was so much the '*intellectus sibi permissus*,' the mind given liberty to guess and imagine and theorize, instead of, as it ought, absolutely and servilely submitting itself to the control of facts, that he missed the true place of the rational and formative element in his account of induction."

In fact, Bacon was no philosopher, not even in natural philosophy (to keep that good old term, as the Scotch are doing), which was all he pretended to, and which he seemed to think could be perfected without mathematics; he was a *littérateur*, with a fondness for science, a quick eye for rhetorical and fanciful, rather than real analogies, and in style a morbid taste for decoration.

"What then, with all these mistakes and failures, not always creditable or pardonable, has given Bacon his preëminent place in the history of science?" A mistaken notion, we should say, an idea which long pervaded the English mind, that his great endeavors had produced corresponding fruit. Our author answers the question differently; and one would like to defer to his judgment and that of M. de Rémusat. They seem to claim for him—after all these deductions—a rank in the world of thought barely second to that of Aristotle. If the eulogy through several pages may be somewhat overdone, it is reduced to just proportions in the following passage:

"Bacon, like Aristotle, belonged to an age of adventure, which went to sea little knowing whither it went, and ill-furnished with knowledge and instruments. He entered with a vast and vague scheme of discovery on these un-

known seas and new worlds which to us are familiar and daily traversed in every direction. This new world of knowledge has turned out in many ways very different from what Aristotle or Bacon supposed, and has been conquered by implements and weapons very different in precision and power from what they purposed to rely on. But the combination of patient and careful industry with the courage and divination of genius, in doing what none had done before, makes it equally stupid and idle to impeach their greatness."

Aristotle lived about 2,500 years ago, and his fame is undiminished. Bacon's fame has endured for 250 years, of late with sensible diminution. The place which it is finally to occupy must be left, according to Bacon's bequest of his whole name and memory, "to men's charitable speeches, and to foreign nations, and the next ages." Our author, in this volume, has shown—as we should expect—that "charitable speeches" and just judgment may go hand in hand. Robert Boyle, the founder of experimental philosophy in Great Britain, was born in the year of Bacon's death. It would be interesting, and much to the purpose, to know what, if anything, he owed to Bacon.

As our author attributes to Bacon "a genius second only to Shakespeare," readers may like to know whether he makes any reference to the peculiarly American Bacon-Shakspere craze. There is one in the extract with which we will close our notice of this fascinating book:

"So he died: the brightest, richest, largest mind but one in the age which had seen Shakespeare and his fellows; so bright and rich and large that there have been found those who identify him with the writer of *Hamlet* and *Othello*. That is idle. Bacon could no more have written the plays than Shakespeare could have prophesied the triumphs of natural philosophy. So ended a career than which no other in his time had grander and nobler aims—aims, however mistaken, for the greatness and good of England, aims for the enlargement of knowledge and truth, and for the benefit of mankind. So ended a career which had mounted slowly and painfully, but resolutely, to the highest pinnacle of greatness, greatness full of honor and beneficent activity, suddenly to plunge down to depths where honor and hope were irrecoverable."

The Wonders of Plant-Life under the Microscope. By Sophie Bledsoe Herrick. G. P. Putnam's Sons. 1883. Pp. 248.

THIS little book, made up of magazine articles, with some additions, is full of wood-cut illustrations from various sources, many being original, and some of these good, some certainly curious. Curious also is the way in which the more recondite and abstruse matters in vegetable anatomy and physiology are treated with the same familiarity and confidence with the every-day topics of plant-life. The reader who can understand and digest it all will be no tyro. Perhaps the book would have been more instructive if its author had attempted less.

BOOKS OF THE WEEK.

Aristophanes: The Frogs. Introduction and Notes by W. W. Merry. Oxford: Clarendon Press.

Bassnett, T. The True Theory of the Sun. G. P. Putnam's Sons. $3.

Blouët, Paul. L'Éloquence de la Chair et de la Tribune Françaises. Vol I. French Sacred Oratory. Oxford: Clarendon Press.

Collins, J. H. Mineralogy. 400 illustrations. G. P. Putnam's Sons. $1.25.

Craddock, C. E. In the Tennessee Mountains. Boston: Houghton, Mifflin & Co. $1.25.

Crane, Rev. Dr. W. C. Life and Select Literary Remains of Sam Houston of Texas. Two vols. in one. Philadelphia: J. B. Lippincott & Co.

D'Anvers, N. Science Ladders. G. P. Putnam's Sons. $1.50.

Day, E. P. Collacon: An Encyclopædia of Prose Quotations. With Biographical Index of Authors. International Printing and Publishing Office.

Durant, Héloïse. Pine Needles, and Sonnets and Songs. G. P. Putnam's Sons. $1.75.

Emerson-Channing (W. H.)-Clarke. Memoirs of Margaret Fuller Ossoli. Vol. I. Boston: Roberts Brothers. $1.50.

English as She is Spoke; or, A Jest in Sober Earnest. G. P. Putnam's Sons. 50 cents.

Gilmore, Prof. J. H. The Academic Speaker. Rochester: Scranton, Wetmore & Co.

Globe Pronouncing Gazetteer of the World. 32 maps. G. P. Putnam's Sons. $2.50.

Green, W. S. The High Alps of New Zealand. Macmillan & Co. $2.25.

Hake, A. E. The Story of Chinese Gordon. With additions, bringing down the narrative to the present time, by Hugh Craig. R. Worthington. $1.50.

Hallowell, Anna Davis. James and Lucretia Mott. Life and Letters. Boston: Houghton, Mifflin & Co. $2.00.

Hamerton, P. G. The Intellectual Life. Author's Edition. Boston: Roberts Brothers. 50 cents.

Hyiton, Dr. J. B. Above the Grave of John Odenswurge, and Other Poems. Howard Challen.

La Cour Impériale à Compiègne. Paris: Charpentier; New York: F. W. Christern.

Lang, A. Ballades and Verses Vain. Charles Scribner's Sons. $1.50.

Lodge, H. C. Studies in History. Boston: Houghton, Mifflin & Co. $1.50.

Malabári, B. M. Gujarát and the Gujarátas. 2d edition. Bombay: Education Society's Press.

Manton, W. P. Beginnings with the Microscope: A Working Handbook. Boston: Lee & Shepard. 50 cents.

Marsh, A. J. New Manual of Formed Phonetic Short-Hand. San Francisco: A. L. Bancroft & Co.

Martin-Moale. Handbook of Vertebrate Dissection. Part III. Macmillan & Co. 60 cents.

Maurice, J. F. Life of Frederick Denison Maurice, chiefly told in his own Letters. 2 vols. Charles Scribner's Sons. $5.

Merz, J. T. Leibniz. Philadelphia: J. B. Lippincott & Co. $1.25.

Milton, John. Poetical Works. W. E. Russell.

Neilson, Joseph. Memories of Rufus Choate. Boston: Houghton, Mifflin & Co. $5.00.

Oliver, Grace A. Anna Letitia Barbauld: Tales, Poems, and Essays. With a Biographical Sketch. Boston: Roberts Brothers. $1.

Parker, T. J. A Course of Instruction in Zoötomy (vertebrata). Illustrated. Macmillan & Co.

Reade, Charles. Good Stories of Man and other Animals. Harper's Franklin Square Library. 20 cents.

Rogers, J. E. T. Six Centuries of Work and Wages: the History of English Labor. G. P. Putnam's Sons. $3.

Romanes, G. J. Mental Evolution in Animals. With a Posthumous Essay on Instinct, by Charles Darwin. D. Appleton & Co. $2.00.

Ruskin Birthday Book. A Selection from his Works. John Wiley & Sons. $2.50.

Sibbald, J. G. The Divine Comedy of Dante Alighieri. Edinburgh: David Douglas.

Spurgeon, Rev. C. H. The Clew of the Maze and the Spare Half-Hour. Funk & Wagnalls. 75 cents.

Stokes, G. G. On the Nature of Light. Macmillan & Co. 75 cents.

Stratford by-the-Sea. A Novel. Henry Holt & Co. $1.

Straub, J. The Consolations of Science. Chicago: The Colegrove Book Co.

Tait, P. G. Heat. Macmillan & Co. $2.25.

Thatcher, E. Digest of Statutes, Admiralty Rules, and Decisions upon the Jurisdiction, Pleadings, and Practice of the U. S. District Courts. Boston: Little, Brown & Co.

Theuriet, A. Le Mariage de Gérard. Wm. R. Jenkins. 60 cents.

Trollope, A. An Old Man's Love. Harper's Franklin Square Library. 15 cents.

Westlake, J. Lehrbuch des Internationalen Privatrechts. Deutsche Aufgabe von F. von Holtzendorff. Berlin: C. Habel.

Wife of Monte-Cristo; being the Continuation of Alexander Dumas's Novel of the Count of Monte-Cristo. Philadelphia: T. B. Peterson & Brothers. 75 cents.

Fine Arts.

THE ACADEMY EXHIBITION.—II.

THE landscapes (including marines, etc.) of the exhibition not noticed in regard to the special quality of fidelity to nature, fall mainly into two classes, conventional (which includes almost all commonplace work) and ideal, *i. e.*, in which color or composition is distinctly the motive. The most widespread error in regard to art (and especially erroneous as applied to landscape) is that its chief function is to imitate nature. No landscape which is simply content with this office can be classed with the noblest art. There are, and always will be, painters of power and great sincerity, whose abilities will be distinctly limited to the straightforward and more or less rigorous realism which, to the uneducated mind, represents nature. These painters in their place are worthy all the success they attain, and it would be well if every landscape painter were compelled to begin with a course of this severe attention to the facts of nature. If there be in him the higher ideal qualities, they will come out with time and training; without the latter they will never get full expression. "Despise not the day of little things" is a maxim which should lie near the heart of every young painter. The work of Albert Ryder, No. 191, indicates native powers of a high order and the feeling of a true colorist, but neither a good method nor tolerable execution. It is typical of a large class of painters who, sometimes from want of executive ability, sometimes from want of self-discipline and artistic conscience, avoid the study of nature, which "puts them out," and trust to unassisted "feeling," wherein they are as sensible as poets who dispense with grammar and reading. Nature furnishes painters with their alphabet and vocabulary, better, on the whole, than any which they can invent for themselves. They are not forbidden to invent, modify, and suppress at will, but they will hardly do wisely the one or the other without having a thorough knowledge of that which nature has provided. Mr. Ryder's work, which is the admiration of a large class of artistically minded people, not only proves his natural abilities, but his utter failure to improve them by proper study and discipline. The history of art (especially American art) abounds in instances of this kind of sterile talent—of painters who only lack training to become great painters, but whom this want limits rigorously to the artistic limbo of still-born genius. Mr. Blakelock (No. 468) lies under the same sentence. The great mind of Da Vinci delivered the sentence which in one shape or another has been repeated over and over by every subsequent supreme artist: "Thou, O God! sellest us all good things at the price of labor." Sir Joshua put it in another shape: "Nothing is denied to well-directed labor." While we recognize with pleasure the evidence of so poetic a talent as that of Mr. Ryder, and that it is of the finest grain, we can only lament that the want of adequate training (and a peculiar and eminent talent is more exacting in this respect than a commonplace one) should condemn it to such maimed and incomplete results.

The work of Mr. Bunce comes in the same category, and his Venetian pictures, Nos. 13 and 396, show the most subtle feeling for tonality, with an incomplete command of the grammar of art. Two small works by Chas. Warren Eaton, Nos. 9 and 12, have to a certain extent the same charm, with a better knowledge of nature than the pictures named, and have indeed the distinct quality of nature's poetic phases. The little picture by Mr. Murphy, No. 305, must be classed in the same general category of work the motive of which is distinctly removed from the commonplace interpretation of nature, but which at the same time struggles with partial training. Bristol's "Keene Valley, Adirondacks," No. 207, is a sunny, effective picture, well composed and well carried out, but with a certain conventional treatment of facts which is not, however, objectionable from the point of view of the artist's way of looking at nature. There is a measure of conventionalism admissible in landscape painting, and indeed, to some forms, indispensable, because the exact and uncompromising rendering of all the detail in a wide distance, if it were practicable to human vision and hand, would not always render the effect of nature, and is not in all cases worth the labor involved. "Facts don't make a picture," and the importance of a picture is not in the character of its facts or the nature of them, but in the use and relation of them. Mere minutiæ are of no importance, and a multitude of facts, too strongly put, leave simply the impression of a hard array of unimportant details, which a painter of true feeling renders more impressively by a conventional statement of them; and this is more or less the case in all good landscape painting, rather more as it approaches the imaginative or poetic, the subordination of facts to the broader and larger truths being the *sine qua non* of poetical treatment. But to conventionalize wisely and expressively it is necessary to

know thoroughly the material, and this brings us back to the same point of the necessity of minute study as a preparation for a larger or poetic style. Swain Gifford, in all his contributions, shows with excellent color a fair mastery of this puzzling problem, which every painter must settle in his own way to have the solution of any real value. Our earlier painters, Cole, Durand, and Doughty, are excellent examples of the varied and individual qualities to be developed in this way. The veteran Moran allows his facility of treatment to carry him too far, and his "Gathering Storm," No. 30, with a remarkable power over effect and large masses, has a glittering facility in rendering the detail, and an exaggeration of the effective passages, which suggest morbid feeling and a drift into the mechanical and formal which characterize the tract that lies beyond wise and good conventionalization. Moran is a colorist in the proper sense of the term, and it is his own fault if he seems to some to be merely trying to catch the tricks of Turner.

An excellent picture in general feeling, but which is not readily to be classified, is "The Upper Hudson," No. 90, by Walter L. Palmer, of which the rippled water-painting is a notable success, and the effect, as a whole, a subtly felt and rightly painted sunshine effect. "A Clammer's Home," No. 104, is well felt and worthy a better place than the Hanging Committee gave it. McCord's "Cross-road Bridge," while leaving very much to be desired in its conventionalizing, has an excellent basis. Why not have gone a little further, Mr. McCord? The "Old Court at Honfleur," No. 278, by Mr. Platt, shows what previous studies have made clear, that he has a very remarkable eye for color and a decided gift for execution. The subject is a difficult one, but is well rendered and with great facility. Clifford P. Grayson's "Wet Day, Brittany," No. 316, is an admirable piece of large realistic painting, solid in method and excellent in tone. Mr. H. Winthrop Pierce's "October," No. 343, is, like some other good pictures, maltreated by the Hanging Committee, but is still to be recognized as a picture of genuine originality and power.

The brothers Hart used to paint better things, for their present work is too easy in its conventionalism and too far from nature as to characterization, while the color leads one to think that the artist believes a hot shadow good to make a warm picture, which is the reverse of the truth.

The marines, except Mr. Richards's, are all too far gone in conventionalism, though sea painting necessitates more of it than is needed in landscape. The small facts in moving water are not only hard to catch, but ineffective when caught. The chief facts of the sea are its swing, its transparency, and its lustre. Mr. Quartley's Nos. 374 and 521 have a good suggestion of these qualities rather than a complete rendering of them, though less complete than in earlier pictures, and, what is not always the case in marines, his shipping is well drawn; but why does he despise his skies, which are without form and void of any cloud quality—painty, and as unaerial as sky could be painted? And even such as they are, they have nothing to do with the sea beneath them. Now the surface of breaking water is more or less governed as to its color by that of the sky above it. Mr. Quartley's skies vary, but his sea does not, and in these pictures the latter and the former are of two worlds. Mr. De Haas in No. 277 errs in precisely the opposite direction—he exaggerates the silvery sheen of the sky, and gives all reflection, but not the reflection of all parts of his sky. He can, after so many years of painting a sea in this special manner, hardly be expected to see that there is more in it than he shows. His rendering is vigorous but unrefined, and by far too conventional. Mr. Moran's "Norther in the Gulf," No. 241, is theatrical if powerful, and morbid in its inkiness, which debars both local color and reflection. It is better in form, and the passage at the extreme right is very true in its wash of foam and swing of the choppy, shallow-sea waves.

There are some still-life and flower studies which merit notice: a box of peanuts in the south gallery is in its way a curiously faithful bit of color. "A Symphony in Yellow," No. 383, is really a very brilliant and artistic bit of coloring, but this use of terms like symphony, nocturne, etc., etc., already appropriated or absolutely proper only to music, savors of charlatanry. "Daisies," by Julia Dillon, No. 75, is a brilliant bit of painting, and there are some others of the kind dimly seen, and not to be judged, therefore, in the corridor.

The figure pictures at the Academy contain by far the greatest amount of ability shown in the collection. The landscape seems to have, on the whole, grown weaker than it was years ago, and, reviewing the exhibition carefully, we find little that we could add to the selections already made. The veterans Hubbard, Whittredge, Bierstadt, Cropsey, and Richards, have settled into definite grooves, in which their places have long been known, and where the public expects to find them. If Mr. Hubbard in his solitary contribution of this year has left his usual key of color, he has not abandoned his manner. The Harts, Gay, Casilear, and the Smillies seem to have forgotten that beyond the fields of their long-ago triumphs there are new victories to be won, and they set the younger men a profitless example. We believe that it would be of very great advantage to art in America to have a review exhibition of the painting of the whole period included in the duration of the Academy, and we feel sure that there is not one of the older men now painting who would not be stirred by his own earlier work, while the best examples of Cole, Durand, Doughty, and their contemporaries would show the younger men and the modern public that if the old art was less conversant with the facilities of to-day, it had a purpose and an all-roundness which we do not find in its successor in the Academy. The abilities of the living painters whom we have named above are indisputable: their rank has been earned by good work; but art lives in easy times when success so many years ago satisfies its ambition.

In figure painting there is more life and better work on the whole than the early Academy could show, and the younger men, in the main, carry off the honors. The President maintains his suave and refined manner both in portrait and his subject picture, "The Goldsmith's Daughter." Beard has never been more successful or humorous than in his "Who is Afraid?"—a group of rabbits spying out the ambush of a felon fox; and Mr. Wood's "Good Night" is up to his standard. Henry's "In the Roaring Forties" renders a subject full of difficulties, studied with the greatest sincerity and well told throughout. Yewell's "In the Studio" is a solid and well-conceived pictorial treatment of portrait, and Loop's "Summer Moon" is as charming a piece of color-motive as he has ever painted, exceedingly subtle and harmonious. But what use is served by the exhibition of crudities like those of May (Nos. 260 and 381) and Howland (No. 414)? Mr. Brown, with his eternal street boys, clean-washed and carefully ragged, street Arabs made out of Sunday-school children, in whom is no possibility of an interesting and picturesque wickedness—reminding one of the orphan children that rush across the stage in an English pantomime—of what world are they? Once, twice, or even now and then, art can tolerate such stage drollery, but *toujours perdrix* is bad enough—always the spurious loafer-boy is too much. If it pays, and there is a public for such work, it is quite natural for Mr. Brown to go on painting him, but it is a pity that his public did not beg him to paint better ideals with the skill and sense of color which he certainly has.

Winslow Homer, in his sole contribution, "The Life Line," seems to be giving himself up to the downward drift of art, which abandons all struggle with difficulties, and accepts past triumphs as warrant for any eccentricities and any amount of careless painting. One must suppose that a painter who could give this smooth, slaty mass, heaved into artificial billows—leaden pigment, with no quality of substance or semblance of the tempestuous ocean, without foam or fury, neither depth nor surface, tame scenic storm-wave—for a sea which could justify the use of the life-line, must imagine he had to do with people who never saw a storm at sea. Nor is its dramatic element more sincere. Is the pretty young woman who has divested herself of everything but a black bathing dress to show her form as much as possible before intrusting herself to the arms that cradle her so gracefully, comfortable in them? The half-drooping head, the hand clinging to the cord, the graceful combination of nether limbs, and the tranquil abandon to the situation betray entire consciousness of the romantic position—neither insensibility nor terror is in her case to be predicated. She may as well open her eyes; any one can see she is shamming, and if she lifted her head to a comfortable pose it would be no more evident. She seems to recognize the fact that there is no danger in such a sea, and that the situation is only a pleasant adventure. When a man who has done the good work Winslow Homer has shown, sinks into such bathos in paint as this, one must wonder if his case is not hopeless.

Let us get to better and more cheering work. Mr. Turner's "Courtship of Miles Standish," No. 282, comes well to the front among the figure pieces. It is in a charming gray tone, silvery and luminous, and Standish's bashful silence and far-off worship, the mute admiration of his ideal, like that of Endymion for the moon, the conscious air of the maiden, as silent as he, but feeling and betraying, in the suspicion of a smile lurking in the corners of her pretty mouth, that she reads him and waits for him to break the ice, make a happy little drama well put on canvas. "The Courtin'," by Anshutz, No. 179, ought to meet with favor, for it is an admirable illustration of Lowell's wise and witty ballad of the same name. The quizzical humor of Huldy's jeering smile contrasts with the awkward and embarrassed state of the suitor, though the dramatic unity of the poem is lost in making him standing as if he had just come in, whereas one sees from Huldy's triumphant air that she feels that her fish is hooked and she has only to choose her moment, a point at which, in the poem, she arrives much later in the visit. But the firelight and the glowing interior, "warm from floor to ceilin'," is excellent painting. Kenyon Cox's little picture, "A Corner Window," is a thoroughly well-painted study—the figure strong in characterization, the *ensemble* very complete, and the execution facile and sincere, without the least affectation of *chic;* as execution, it is quite as good as anything in the exhibition. No. 93, "The Antiquary," by Brenneman, is a good piece of solid work, excellent in color, and extremely careful and faithful in execution, the composition reminding one a little of Japanese work in its waywardness, but happy in its reminder. Ulrich's "In the Land of Promise, Castle Garden," is, as a bit of real-

ism, and especially in types of character, a most noteworthy work, ingenious in its conception of giving to an American subject, properly speaking, the more picturesque forms of individuality which the artist wanted. But it has the defect of monotony of its types, as though the painter, a German himself, had no sympathy with any race but his own.

"The Duel," No. 420, by Leon Moran, is in another way an excellent picture, with a happy feeling for tone. The snow in the twilight leading off into the luminous sky, and the figures, well drawn, and painted with a facility and precision of method which are almost dangerous to so young a painter, and which in many cases lead to hardness and unsympathetic execution, all mark the picture at first glimpse as the work of a genuine talent and a possible future. But in the dramatic quality the painter has sacrificed too much to his composition. One of the combatants has already thrown off his coat and stands ready for the encounter, while the other at a distance discusses, coat still on, with his second, apparently, as to what to do. One at once surmises that after all there will be no duel; and they are, besides, at a distance which suggests pistols, not rapiers, which they both hold. "Mr. Jefferson as Bob Acres," by Mr. Alexander, though hung in the corridor and ill seen, is an excellent study of portrait in character, and the painting of the costume is very brilliant as execution. If the artist would take off a foot from the bottom of his canvas and put it on the top, he would feel the gaininthe dignity of his figure. Louis Moeller's "Puzzled," No. 320, a very well-painted figure, with accessories in an excellent vein of tone and execution, is a success in its way, but frivolous in its motive, for the puzzle is rather with the spectator than with the elderly gentleman who looks at a geographical globe as though he were expecting it to turn alone; but what the puzzle on his mind is, is, of course, beyond any conjecture of ours, and any other name would be as fit. Still, it is uncommonly well painted, though in the German vein, like the work of a Munich student. Alice Barber's portrait figure of a child. No. 274, seated in a high chair, is in an excellent manner of work, happy in pose, and natural, well drawn, and of great sincerity and simplicity in color. Walter L. Palmer's "Studio Interior," No. 116, is good study, and shows power and promise in the painter. Mr. Monk's sheep pictures are noteworthy for their fine sense of the pictorial, and sympathy with and knowledge of the fleecy tribe, and with time and nature he will, we believe, go far and place himself high in the roll of animal painters.

Mr. Miller's "Charity Home," No. 337, is, in spite of its somewhat uncouth subject, certainly one of the most noteworthy works in the exhibition. "The Wedding Dress" of Mr. Weldon, No. 258, is a picture which in its vein of picturesque genre is one of the most successful on the walls. The expressive pose of the young widow, whose grief has, however, evidently had time to subside, the rather disparaging air in the examination of the dress by the old bric-à-brac dealer, are well given, and the painting of the multitudinous accessories is clever and direct; the play of color in the varied material is very effective, almost masterly, and lacks but a little more thoroughness to become so. There is here and there evidence of the desire to seem more at ease in painting of detail than the painter really is. This tendency is one of the greatest dangers of realistic painting, and if yielded to, is inevitably fatal to noble execution. Any affectation or pretence in painting is worse than it is in manners. Bridgman's "First Lesson in Arabic" is a pleasant bit of Eastern life pleasantly painted, but the lesson doesn't seem to be in Arabic. Are not the names of two pictures changed by mistake? This seems too clearly a misnomer.

Millet's "Regina Convivii," No. 118, breaks ground in another direction, and while the so-called archæological art is not in our opinion a legitimate matter for idealism, and, when followed for its archæology, is certain to be spurious, the classical motive, like the mediæval, becomes, by its facility for idealization and the freedom of treatment it affords, one of the highest walks of art. To waste one's life in restoring to art the motives of a past which is utterly dead, with the pretence of giving *actuality* to scenes and characteristics of antiquity, is a double mistake—firstly, because the choice of subject for realization in which the value, if any, is purely scientific, has nothing to do with those motives which are appropriate to art proper; and secondly, because the pretended realization is certain to be a complex blunder. We, in our ignorance of antique life, may imagine that the painter of antique subjects restores it, but it is most certain that if one of the men of those times were to step into the studio he would find it as funny as Rembrandt's Gethsemane, with the Dutch guard armed with blunderbusses. Alma-Tadema, who is of moderns most ambitious in this vein, has, for instance, painted, in his Sappho, a theatre of the post-Periclean epoch, whose seats are inscribed in the most archaic Greek letters, and has given Sappho a reading-desk of a Pompeian pattern! To accept such restrictions as this kind of archæological art imposes is to devote one's self to blundering; for no intelligence can restore the externality of antique life, and to attempt to realize what we can only conjecture about, is utter absurdity. All we know is here and there a fragment. But to take from the classic or mediæval world an ideal, and embody it in complete artistic freedom, is one of the truest aims of art. This is, indeed, the secret of the charm of subjects drawn from classic times, that they allow a freedom of treatment which the subject of our own times does not; and the artist who follows art for its own sake turns to the remote past for this freedom's sake. The sympathy with the classical or mediæval motive (not necessarily the classical or mediæval incident, however) is based on the longing for the freedom of an ideal state, and they who do not sympathize with this can only confess that they do not know what is the artistic and what the historical in art. Ideal art by necessity escapes from the conditions of contemporary life because they are too rigid, and leave nothing of that scope for phantasy and design which are the *sine qua non* of the purest art. So the early Italian painters escaped to the sacred record or the pagan Olympus, never painting the conditions of their day, and so Rossetti and Burne-Jones take refuge in the Arthurian or Dantesque cycles, or the classical, to escape conditions hampering to their art. Even we, with our American history, go back to the old colonial times, as Mr. Turner with his "Standish," and Mr. Satterlee with his "Runaway Couple," No. 232. Of our own day nothing but the most realistic art is acceptable. Mr. Millet is a true classicist, and while he keeps, as in his "Queen of the Feast," to ideal types, he will sacrifice nothing to his love of the Greek ideal; but if, mistaking, he attempts to make classic life an actuality, he will fall as all creators of the *antiquarian genre* have fallen—Gérôme, Alma-Tadema, etc., etc.

We cannot dismiss the figures without a word of approbation for the delicate and refined qualities of Mr. Hamilton Hamilton's work, especially Nos. 4, 415, and 190; Mr. Witt's "Hookey," No. 333; Ferris's "Companion of the Janissary," No. 49; Nicholl's "Fisherboys, Venice," No. 52; Champney's "Coquette," No. 74; Wordsworth Thompson's "Moorish Hunters," No. 136; Alexander's "Cap Maker," No. 227; Turner's "Ruth Huckabuck," No. 405, and the charming fancy of Mr. Church, No. 456, the poor little Cupid tormented for his sins, pitiful darling. Mr. Thulstrupp's "Family Prayers," No. 346, seems to be an excellent picture, but hangs where no judgment can be formed of it. Mr. Champney's "Ophelia" can be seen little more satisfactorily.

HENRY HOLT & CO., N.Y.,
HAVE JUST READY:

Stratford-by-the-Sea.
A Novel. 16mo (*American Novel Series, No. 4*), $1.00.

Called Back.
By Hugh Conway. 16mo. Leisure Hour Series, $1.00; Leisure Moment Series, 25 cents.

RECORD OF POLITICS and Politicians in the United States, 1865-1882: An analytical index to the *Nation* for that period (with occasional parallel references to McPherson's Political Handbooks and other sources). This index supplements the chiefly literary index to the *Nation* published in 1880. Valuable to all libraries, students, and editors. Price, in paper, $1 00. (Purchasers will please remit with order; accounts cannot be opened.) Address PUBLISHER of the *Nation*, Box 794, New York City.

WE WILL FURNISH A SAMPLE Case (12 quart bottles, no two alike), pure California Wine, price $5. SONOMA WINE AND BRANDY CO., 30 Warren Street, New York.

The Nation.

NEW YORK, THURSDAY, APRIL 24, 1884.

The Week.

THE so-called alliance of the Edmunds and Arthur forces at Utica has no other significance than this, that the supporters of Mr. Arthur, finding that they had no chance of electing their own men, gave their support to those who were least obnoxious to them. The Independents have at all times recognized the meritorious character of President Arthur's administration. They have considered his nomination inexpedient more by reason of his political associations than of his conduct in office. But they have not failed to award him the praise due to a safe, conservative, and judicious public policy. There is nothing wonderful, then, in the fact that the Arthur men in the Convention, finding themselves in imminent danger of being given over, bound hand and foot, to their avowed adversaries, turned their own strength into a channel which would save them from irreparable disaster; for if the Blaine men had secured the delegates-at-large from New York, or even half of them, Mr. Arthur's prospects would have collapsed at once, and the Stalwarts would have left Utica with a sense of disgrace as well as of defeat. As the case now stands, the Half-Breeds cannot brag over them at all the village and ward gatherings in the State, and this is no small consolation. It is a dreadful thing to a "boss" to be ridiculed for his want of success.

It is not too much to say that the result of the New York State Convention will have a powerful influence upon the National Convention. The mere numbers of the district delegates will count for little as against the voice of the State, which says distinctly that a candidate of the type and general equipment of Mr. Edmunds can probably carry the State and be elected. It is of small consequence in comparison whether Mr. Blaine or Mr. Arthur has the larger numerical following. The State itself has pronounced in favor of a third man, and has indicated what kind of a third man it prefers. It has given a verdict against the spoils system and in favor of reform. It has committed its potent influence in national politics to the hands of four uncompromising foes of the Machine. It has done more. It has ratified, in the most public manner, and by a unanimous vote, the efforts made by Mr. Roosevelt to purify the municipal government of New York. No young man of this generation has achieved so remarkable a civic triumph in so short a time. He well deserves to be made chairman of the delegation at Chicago. The prestige of success has thus far waited upon him, and New York will be well content to have her vote announced by one who not only desires to deliver her from misrule, but knows how it is to be done.

The Ohio Republican Convention calls for notice rather by reason of the platform adopted than of any distinct preferences shown for a Presidential candidate. Senator Sherman appears to be the first choice of three of the delegates-at-large. The fourth is believed to favor Mr. Blaine. According to the outward aspect of the proceedings, the entire delegation is more concerned with the problem of party success than with the fortunes of any candidate. The platform was reported by the Committee in the usual way, with a resolution favoring the collection of "adequate revenue to defray the economical expenses of the Government, from duties upon foreign imports, so adjusted as to afford protection to the labor and the agricultural, manufacturing, and other industries of the country." The resolution, in its terms, excluded the taxes on whiskey and tobacco from the sources of national revenue, and the exclusion was apparently intentional. The existence of a windy faction in both parties, led by Mr. Kelley and Mr. Randall respectively, who favor the repeal of all internal-revenue taxes, in order that the treasury may be depleted and the demand for tariff reduction silenced, could not have been absent from the minds of the framers of the resolution. Yet the real significance of the platform was not at first noticed, and it was adopted without a division. Subsequently it was perceived that the resolution would expose the party to the charge of desiring to repeal the tax on distilled spirits. The vote was promptly reconsidered, the platform recommitted and reported back with changes of phraseology embracing "proper internal taxation" among the sources of national revenue. This action is more significant as an expression of public opinion in reference to the whiskey tax than if the resolution had been reported originally in the shape in which it finally passed. It shows that temperance is a stronger sentiment in the party than tariff, and that whenever the two come in collision, as they must eventually, duties on imports will be reduced rather than taxes on liquor.

The great Wharton Barker scheme for distributing the surplus among the States does not make its appearance in any of the State platforms. Even the Pennsylvania Republicans, who adopted it last year, have now dropped it. We cannot recall any other case in which a great idea, which had obtained any recognition at all, disappeared suddenly from the public gaze in this way. There could hardly have been a better illustration, however, than this scheme was, of the warping effect which the tariff exercises on the human mind in Pennsylvania. The faculties which are employed in finding excuses for keeping duties high are developed to an inordinate degree at the expense of the others, until the power of comparison is seriously impaired. In many very acute minds in that region the original object of taxation is almost forgotten, and some people seem to believe that the State may tax a man for fun if it can find no serious use for his money.

The adoption of Mr. Cox's amendment to the Shipping Bill by the large majority of 111 to 69, is a notable triumph over ancient prejudice, and a great step towards commercial freedom. The amendment provides that foreign-built iron ships of not less than 4,000 tons burthen may be admitted to American registry, if owned wholly by American citizens, to be employed exclusively in foreign trade. We call this a triumph over prejudice because nothing but prejudice has maintained the prohibition against foreign ships. A ship is useful only for its carrying capacity, and if we permit the foreign carrier to come here with his cheap ship and compete with the American carrier in the transportation of goods and passengers to and from other countries, it is sheer bigotry and nonsense to prohibit American citizens from buying the cheap foreign ship if they wish to do so. Not only do we admit foreign competition in the carrying trade, but we admit the foreign ship itself, if it is hired and not owned. Any American citizen can charter a British steamer and keep it in service as long as he chooses. Any American citizen can invest as much money as he chooses in mortgages on foreign ships. In short, anything can be done under the old stupid navigation laws which produces competition in ships' *earnings*. It is only as to the flag and registry that the prohibition applies. An American and an English ship may sail side by side from New York to Havana year after year, in the service of an American citizen or company, the one actually and the other virtually owned by Americans, but only one of them can fly the American flag. The climax of absurdity is reached when we are told that the prohibition is necessary in order to restore the American flag to the ocean! If it is important to display the American flag on the high seas, surely one additional showing can be made by hoisting it over the steamship *British Empire* running in the Alexandre Line from New York to Cuba. By changing her name to *George Washington* she would make as brave a display of the stars and stripes as any ship launched by John Roach.

The bill reported in the House from the Committee on Education and Labor for the protection of American labor is a curious piece of legislation. It prohibits any alien coming to the United States under any agreement to work for anybody engaged in the business of mining, manufacturing, building, or transportation, or any corporation whatever. This part of it is what is called "taffy" for the laborer. Then comes "taffy" for the capitalist; for if a person or corporation complains to the President that he is about to start a business requiring skilled labor of a particular kind, of which a sufficient quantity cannot be obtained in the United States, the President, on being satisfied of the truth of the statement, may license such person or corporation to bring in a certain fixed number of such skilled laborers. This sort of legislation is of course sure to come if the present protective policy is persisted in. There is no sense or justice in protecting the products of labor without protecting the laborer also. It is useful, too, as showing the tendency of the protective system toward mediæval restrictions on freedom of

every kind. It is now fast reaching the personal passport or ticket-of-leave stage in this country. From preventing skilled labor coming in under contract there is of course only one step to preventing its coming in at all except under a trades-union license.

We are gratified to note the increasing earnestness of the Chicago *Tribune's* opposition to silver.

"No time," it says, "for forcing more silver into the Sub-Treasury could be more inauspicious than this, when we are losing five millions of gold per week. . . . The more silver this country coins, the more gold it must export. If Congress would abandon its attempt single-handed to sustain the silver markets of the world for the benefit of the silver-mine owners, and suspend the coinage of the silver dollar, our trade balances with Europe would be settled in silver instead of gold. But so long as the Government pays more for silver than any other buyer will give, it will be certain to get all it will take. It will be damage enough to our financial and commercial interests if this Congress fails to accept the warnings of our best financiers that t should discontinue the silver coinage."

This is remarkably sound doctrine, and although we think we have seen something like it before, it is not too late for the Chicago *Tribune* and the Cincinnati *Commercial* to render yeoman service in averting further mischief from the Silver Bill. The country has already lost a heavy sum by its purchases of silver, but this loss can be borne. It is the price which a nation often has to pay for its errors in political economy. The United States are rich enough to buy their experience, but having bought it and paid for it, there comes a time when further purchases in the same market become wholly wasteful for educational ends. The present zeal of the *Tribune* and *Commercial* shows that the limit has been reached, so far as the Republican party is concerned. The Democrats, of course, need another round of punishment, being thicker in skin and skull; but they will get it in due time.

The people of Maine are to vote in September on the adoption of a Constitutional amendment prohibiting forever the manufacture and sale of liquor in the State. An earnest discussion is going on there concerning the merits of this proposition, and a great deal of interesting and valuable information is being disclosed. Maine has been for a third of a century a State in which prohibitory statutes have ostensibly prevailed. All authorities agree that those statutes have not suppressed the sale of liquor, and all the most impartial of them agree that they have had little influence in even restricting the traffic. The judges of the courts declare openly that they believe the proposed amendment would not only be useless, but would abolish the present laws without putting any others in their place. Many eminent temperance advocates are against it, and the principal supporters of it appear to be the more fanatical temperance people, and a few politicians who hope to gain something by their advocacy. A remarkable array of statistics is shown by one of the opponents of the measure, in which it appears that under the present prohibitory statutes there are in Maine 1,255 licensed liquor-dealers, or one for every 518 inhabitants. In the city of Portland there are 203, or one for every 177 inhabitants. These figures confirm the words of another opponent, who says: "So far as my observation goes, I am satisfied that there has been no material diminution of the amount of intoxicating liquor consumed in this State, and if there has been any advance in public sentiment as to the use of intoxicating liquors as a beverage, it cannot reasonably be attributed to prohibition."

General Badeau has resigned his position as Consul-General at Havana, and published a letter explaining his reasons. In general terms they are that the Administration has been "screening corruption," negotiating an "injurious and improper treaty with Spain," besides tolerating "injuries and insults put upon American citizens, American seamen, and American trade." He called the attention of the Administration to this "eight times," but it paid no attention to him, and even refused to let him resign, until he suddenly threatened to "appeal to the people." He challenges the Government to publish every despatch between himself and the State Department, "without one word omitted or one line mutilated"; but it is absurd to expect a hardened old fellow like Mr. Frelinghuysen to do this. A man who has been engaged in systematically screening corruption and betraying his country is not likely to stick at altering despatches. The letter shows one thing very plainly, that the diplomatic service is no place for a man of Badeau's goodness and purity. A consul who is forced to threaten his Government with exposure on the stump certainly ought not to remain a consul. That Mr. Frelinghuysen thought that he could keep him off the stump by refusing to accept his resignation, shows how little he understands either what General Badeau calls "our democratic system" or the General himself. The idea of using a consulate to get hold of Government secrets for Stump use is a very good one, and is all the better because the Government has no Stump of its own on which to reply.

General Butler has followed up his letter on strikes by holding a Greenback Convention in Massachusetts, which will send delegates to the National Convention at Indianapolis next month. The Convention, wisely made up of "men little known outside of their own localities," demanded Butler for President, as the man "through whose means the Supreme Court of the United States became the Greenbackers' allies." The question of General Butler's running for President this year is really a financial rather than a political one. His plan is to get, as he easily can with the expenditure of a comparatively small sum, the Indianapolis nomination, and then threaten the Democrats with putting in the field an Independent Butler ticket if they do not adopt him. The "masses," he will say, are communists at heart, and will prove it by recent votes cast in Massachusetts. Whether he can frighten the Democrats much depends simply upon whether they believe that he is really willing to stake a couple of millions on the result. There is a feeling among some of the conservative Democrats that his "blowing" power on such subjects makes him formidable. Altogether it is an odd sort of an attempt, and will be watched with great interest, not only in the United States but throughout the civilized world.

The principal events of the week in business circles have been the shipment of upward of $5,000,000 gold, a sharp decline in several of the specialties on the Stock Exchange, marked by renewed activity on the part of the bears, and an unexpected advance in wheat, accompanied by several failures on the bear side of the market. The gold export now reaches $32,000,000 since the 21st of February, which is $2,000,000 above the highest estimate made of the probable movement when it began. It has had little effect upon the rates for money as yet—proof sufficient that the loss of it is not harmful to any legitimate interest. It will continue, undoubtedly, until the amount of loanable funds is reduced to the actual requirements of business. Nobody need be alarmed about it until there is a marked rise in the rate of interest, and when this happens it will stop. The exportation signifies merely that gold can be used to better advantage on the other side of the water than here. It is the consequence of extreme dulness in trade. This dulness is shown in a decisive way in the increasing weakness of the coal stocks. The restriction of output has had no effect upon the prices of coal. It has not stimulated the demand, but it has produced a semi-panic among the holders of Reading, which declined nearly eight points during the week. Lackawanna fell off two points, and would have declined more had it not been artificially sustained. The restriction of output is an acknowledgment that the instrumentalities for the production of coal are thirty-three per cent. in excess of the demand. But the excess is really greater than this, and the public are discounting it by selling their holdings. Of the other specialties in the stock market, Western Union, Wabash, Oregon Navigation, Erie, and West Shore bonds were the weakest. The Northwestern properties, except Canada Pacific, were well sustained. Among the Vanderbilts, Lake Shore and Michigan Central show a decline of two points each.

General business is without change. The advance in wheat is equal to six cents per bushel. This was brought about by a belief that the supplies of foreign wheat, especially Indian, have been overestimated, and by the fact that the short interest had been unduly augmented since the recent heavy decline. The attempt of the shorts to cover was attended with disastrous results to themselves. The prospects of the next crop are unusually good, but there is a growing opinion that all the wheat on hand will be needed at home before next harvest. The dry-goods trade is inactive without any let-down in prices. The closing of some of the Southern cotton mills is the most noticeable event of the week. Among New England manufacturers a proposal to suspend one day in the week during May and June is meeting with some favor, but has not yet been determined upon. The iron trade is dull and unchanged. Steel rails are in moderate demand at $32 to $33 per ton. Everything points

to extreme economy on the part of consumers, and nowhere is this more manifest than among railway managers, who are cutting down expenses right and left. The condition of things abroad is very much the same as here. The iron trade in the north of England is in a very unsatisfactory state in consequence of the decline in ship-building, which has been as greatly overdone in the past three years as railway building in the United States.

The account given in the *Tribune* on Friday of the proposed treaty for an industrial union shows that eleven foreign states—Belgium, Brazil, Spain, France, Guatemala, Italy, the Netherlands, Portugal, Salvador, Servia, and Switzerland—have signed it. The treaty contemplates a universal union for the protection of priority in trade-marks and patents, with an International Bureau, to be placed under the authority of "the superior administration of the Swiss Confederacy." As an inducement to the United States to ratify it a curious clause has been added, making the provisions of the treaty "applicable only within the constitutional powers of the high contracting parties." This seems simply to amount to saying that the treaty, like all other treaties, is entered into subject to the Constitution, and it is hard to see how it can affect the powers of the States or of the Union in any way. The existing law on the subject of trade-marks in this country is entirely different from that relating to patents. Authority to legislate with regard to patents is given expressly to Congress by the Constitution (Const. U. S., art. I., sec. 8). As to trade-marks, there is no question that they are protected by the common law of the various States; but the extent of the authority of Congress on the subject has been confined by the Supreme Court to cases arising in inter-State or foreign commerce—*i. e.*, the "commerce clause" of the Constitution is held to be the only one from which power to legislate in this matter can be derived. This decision, rendered in 1879, swept away the earlier trade-mark laws, and Congress thereupon passed an entirely new act, giving protection to owners of trade-marks "used in commerce with foreign nations or with the Indian tribes," through a system of registration; the act, however, applying only to countries which by treaty or otherwise afford similar privileges.

This act was passed in 1881, and to see how it works it is only necessary to turn to the existing treaty with Brazil, ratified in 1879. This provides that the citizens of each country shall have in the other the same rights that the citizens of either have in their own. We have a treaty of precisely the same description with the German Empire entered into in 1871. Apparently an extension of this system to all foreign countries is not thought to be sufficient by those who have the International Union in charge. Some more definite statement of their reasons than has yet appeared ought to be put forward. At least one part of the scheme, that providing for a central control in Switzerland, seems visionary; the distinction between patents and trade-marks has been treated as of no consequence; no country of the first rank, except France, has yet given in its adhesion, and most of those which have signed are the countries whose stake in the matter is smallest. The property interests involved are of great magnitude and importance, and the doors of the Senate might well be thrown open during any debate that may be had over it. We doubt if there are a dozen persons in the United States who could tell on reading the treaty draft whether it embodies a practicable scheme or an absurd one.

Mr. Childers's budget for the year 1884 embraces two subjects of interest to the world at large. One is the statement that the national debt has been reduced by eight and a half million pounds during the past year. The other tells us how the Government proposes to deal with the light-gold coinage, which has been an increasing source of vexation for many years. As regards the national debt, Mr. Childers grappled the subject on his accession to office with statesmanlike forecast, declaring the intention of the Government to set aside a definite portion of the proceeds of the revenue each year to its extinguishment, instead of applying the whole to the reduction of taxes. This policy received its first considerable impulse in public opinion some years ago, when the subject of the coal supply was under discussion. Mr. Gladstone at that time made a speech showing the importance of investing a portion of the national income in years of prosperity in sinking the public debt, reinforcing his position by the example of the United States. Mr. Childers is the first Chancellor who has been able to make any marked progress in this direction. The coinage problem is attacked in an entirely original way. It is proposed to reduce the half-sovereign to the character of a subsidiary coin, like the silver coins, by reducing its value ten per cent., and applying the resulting gain, estimated at £1,330,000, to the restoration of full value to the light sovereigns. This will be an interesting experiment.

It is, however, exciting considerable opposition in England. But the opposition appears to be founded upon a misconception of its purport. The outcry raised against it goes upon the assumption that it is a plan for debasing the entire gold coinage, whereas it is really an endeavor to restore to full value the only part of the gold coinage which enters into international trade, and to do this without a resort to taxation. A recent calculation shows that the annual cost of maintaining the sovereigns at full weight—that is, of making good the loss resulting from abrasion—would be about £29,000, and of doing the same for the half-sovereign about £18,000 more. Mr. Childers's plan proposes to make good the sovereign at the expense of the half-sovereign, by reducing the latter to a subsidiary coin like the shilling and the half-crown. The process would be to recoin the half-sovereigns, taking away a certain amount of gold and adding a certain amount of alloy, investing the difference, estimated at £1,330,000, in three per cent. consols, which would yield a sufficient sum to maintain the value of the sovereign from year to year. As the half-sovereign is used only at home, there is no reason to apprehend any disturbance of any kind from the change. The plan is ingenious and not unscientific, but it will be apt to meet a great deal of prejudice, and may be voted down once or twice before its merits are fully understood.

Mr. Gladstone is evidently firmly opposed to anything like a heroic policy in Egypt, or to any arbitrary assumption of the government by England alone. He is determined to meet the crisis which is now imminent by means of a European concert, and is inviting the coöperation of France in a new scheme for the settlement of the debt, which is again becoming menacing; the deficit in the revenue being tremendous. Most of the bonds are held in France, and the owners, who are a very powerful influence in the French Government and press, are very bitter toward England, and are filling the newspapers with threats and abuse. The French Ministry are probably much more disposed of late to take a firm attitude on the Egyptian question, because it has apparently now been discovered that a Cabinet in France can hold together for more than a year.

One of the great troubles in Egypt just now is the quarrel between Nubar Pasha and Mr. Clifford Lloyd, who has been the leading English administrator there. Nubar Pasha is a very able man, the ablest of all the Egyptian officials, and a strong friend of England, whom it is very desirable to keep in office as Prime Minister, because his resignation means the collapse of the Khedivial Government. But he cannot stand Clifford Lloyd, for the reason well given by the London *Times* correspondent at Cairo:

"Mr. Clifford Lloyd is a man whose social popularity is only equalled by his official unpopularity. He possesses indomitable energy and courage; he is thoroughly in earnest; and he attacks an abuse like a bull, utterly regardless of all obstacles. Political considerations and personal susceptibilities he does not consider to be within his province. He would be invaluable if allowed to rule Egypt as a despot, after the abolition of all the Turkish officials—just as Mehemet Ali was after the massacre of the Mamelukes. But this policy, whatever its advantages, is not consistent with Mr. Gladstone's latest declarations."

So Nubar says that either he or Mr. Lloyd "must go." Now, there is much instruction in this as bearing on the Irish question. Lloyd was a paid magistrate in Ireland during all the late troubles. His brutal and overbearing manners infuriated the Irish with whom he came in contact. He was dogged night and day by assassins, but he was brave as well as insolent, and defied them. He was much complained of, but the Government clung to him steadily as a most valuable man. And a valuable man he would have been, it the plan was to set up a despotic government in Ireland, and rule with the gallows and the bayonet. As a means of restoring order based on conciliation and popular institutions, he was a monstrous absurdity. When the Land Act came into operation and quiet began to return, he was transferred to Egypt, where his bullying ways are again making trouble. He is worth studying as an explanation of the reason why English rule, however just or beneficent, is never popular in any country or with any race.

SUMMARY OF THE WEEK'S NEWS.

[Wednesday, April 23, to Tuesday, April 29, 1884, inclusive.]

DOMESTIC.

Important Republican State Conventions were held on Wednesday. In New York State the meeting at Utica was unusually large. The Edmunds men held the balance of power between the supporters of Blaine and Arthur. About 2 o'clock on Wednesday morning an agreement was reached between the leaders of the Edmunds and Arthur forces, by which a combination was made to control the Convention, the Arthur men accepting the nominees of the Edmunds men for the four delegates-at-large. These were Andrew D. White, Edwin Packard, John I. Gilbert, and Theodore Roosevelt. This was not a compromise, the Arthur men having accepted the Edmunds ticket bodily. The Blaine men were immediately put on the defensive. The four delegates whom they had agreed upon were ex-Governor Cornell, Senator Miller, Messrs. Sloan and Erwin. At noon they changed their programme, hoping to break the Arthur-Edmunds combination, by substituting the names of Roosevelt and Gilbert for Sloan and Erwin. The Edmunds men refused to accept the compromise. The test of strength was made on the vote for temporary Chairman. The Convention was called to order at 12:30, and Mr. Roosevelt, on behalf of the Edmunds-Arthur men, nominated N. C. Boynton for that position. Senator Miller, for the Blaine men, nominated E. L. Pitts. The ballot resulted in the election of Boynton by 251 to 240. The Chair then announced the various committees which the Edmunds men had previously prepared, and a recess was taken.

After the recess Mr. Boynton was made permanent Chairman. The four Edmunds delegates-at-large agreed upon were elected, the vote being as follows: Roosevelt, 472; White, 407; Gilbert, 342; Packard, 256; Miller, 243; Cornell, 228. It took 248 votes to elect. The platform approved protection, advised the immediate suspension of the coinage of the standard silver dollar, the redemption of the trade dollar, and the removal of unjust restrictions upon American shipping interests. Charles Andrews (Rep.) and C. A. Rapallo (Dem.) were renominated for Court of Appeals Judges by acclamation. A State Committee and Presidential Electors were also selected. Senator Miller's plan for a reorganization of the party was referred to a special committee. The general opinion of the result of the Convention is that both Blaine and Arthur have been practically put out of the Presidential race.

In Ohio, Republican district conventions on Wednesday elected twenty-six Blaine delegates, fourteen Sherman delegates, and two unclassified. The State Convention was held on Wednesday and Thursday. J. S. Robinson was nominated for Secretary of State, and Chief-Justice W. W. Johnson for Judge of the Supreme Court. The following delegates to the National Convention were chosen: Judge J. B. Foraker, William McKinley, jr., M. A. Hanna, and W. H. West. Their sentiments are not pronounced except that three of them are not for Blaine. They look upon Sherman with favor. The Maryland district delegates stand Blaine 9, Arthur 2, Edmunds 1. Dakota's two delegates are for Blaine.

The Connecticut Republicans on Wednesday nominated delegates at-large, and district delegates who are uninstructed, but will support General Hawley if his name is proposed. A resolution in his favor was passed by the Convention.

Mahone's party, the Readjusters, held a convention in Richmond on Wednesday, and elected delegates-at-large to the Republican National Convention. The platform gave "emphatic expression to our preference for his (Arthur's) nomination at Chicago," and changed the name of the Mahone party to Republican. It is said that only one member of the delegation ever voted the Republican ticket. The Dezendorf "straightout" Republicans will also send twenty-four delegates to Chicago.

The Louisiana State election has resulted in the choice of a Democratic Governor by about 50,000 majority. There are charges of extensive frauds and intimidation.

The United States Senate on Tuesday passed the Pleuro-Pneumonia Bill.

A bill to protect American laborers, reported favorably to the Senate on Friday, from the Committee on Education and Labor, provides that the importation or immigration from any foreign country of any alien under an agreement, expressed or implied, that he shall work for any person or corporation shall be prohibited; that every such agreement shall be null and void. It provides a penalty of $500 for every violation of these provisions, and that it shall be a misdemeanor, punishable by a fine of $1,000 and disqualification from holding office under the United States, for any person, while in the official service of the United States, to violate any of the provisions of this act, or to aid and encourage such violation.

The Naval and Post-office appropriation bills were reported back to the House of Representatives on Wednesday, with the recommendation that the Senate amendments be non-concurred in. The House agreed to the Senate amendment to the Naval Bill providing for the armament of the new steel cruisers. Conference committees have been appointed to settle the disagreement on other points.

The House of Representatives on Saturday adopted Mr. Cox's amendment to the Shipping Bill by a vote of 111 to 69, making it lawful for any citizen of the United States to import iron and steel steamships of not less than 4,000 tons free, and entitling such vessels to American registry, provided they are owned exclusively by Americans, and not to be employed in the coastwise trade. The bill was then passed by an almost unanimous vote.

Mr. John J. Knox has tendered to Secretary Folger his resignation as Comptroller of the Currency, to take effect May 1.

In the Criminal Court at Washington, on Tuesday, the case of the United States against ex-Senator William Pitt Kellogg was called. Mr. Kellogg is charged with having received money while United States Senator for services rendered in relation to a contract with the United States, in violation of section 1782, Revised Statutes. This is the Price Star-route case. Mr. Ker opened the case for the Government, summarizing the charges against Kellogg.

The Senate at Albany on Thursday passed the bill for a Broadway underground or arcade railroad. The Governor has signed the prohibitory Oleomargarine Bill. On Friday the Supply Bill was passed by the Senate after an unsuccessful effort to strike out items amounting to $250,000.

The State Senate went into Committee of the Whole on the Roosevelt bills for New York on Tuesday. The first three taken up were the Park, Sheriff, and one of the Surrogate's bills. Mr. Robb said that the Sub-Committee of Fifty-three were opposed to the Park Bill. This was news to a good many who were prepared to support the entire series, and especially the Park Bill. Mr. Robb said that, while he favored the single-headed Park Commission, he thought this bill was crudely prepared. It was then temporarily laid aside. The Sub-Committee of Fifty-three disapproved of the bill because it placed too much power in the hands of one man. On every side, among those who have made the fight in Albany for these bills, the sudden attack of the Sub-Committee of Fifty-three on the Park Bill was regarded with disapprobation bordering on indignation. Notwithstanding this rebuff the Sheriff Bill was advanced without amendment. Later, all three of the bills in the first Committee of the Whole—the Park Bill and the Sheriff's and one of the Surrogate's—were reported favorably and ordered to a third reading. An attempt was made to recommit the Park Bill to the Committee on Cities, but it was defeated, only six voting for it. The Senate then went into Committee of the Whole on three other bills of the series, the Register, and two County Clerk bills. These three bills were also reported favorably and ordered to a third reading with no amendment. This places six of the reform bills on the stage of third reading in the Senate without change. The Jail-Crowding Bill went the same way as soon as the next Committee of the Whole was formed.

In the Assembly on Tuesday Mr. Roosevelt succeeded in getting his Bureau of Elections Bill ordered to a third reading. It provides for the appointment of two reputable citizens and taxpayers, one from each of the two leading political parties, who shall constitute the Board of Elections in New York City. The resolution for a Prohibition Amendment to the Constitution was then called up for reconsideration, but on its final passage was lost—ayes 63, noes 60. Sixty-five votes were required to pass it.

About 5 o'clock on Sunday afternoon the most destructive tornado ever known in Ohio passed over the southern part of Montgomery and Greene Counties, devastating everything in its course. It appears to have originated near Woodburn. Almost the whole of Jamestown was destroyed and six persons killed. Among the other towns seriously damaged were Alexandersville, Carrollton, Bellbrook, and Xenia. The path of the tornado was about one-eighth of a mile wide.

Destructive forest fires prevailed in Michigan on Sunday, accompanied by severe gales. Two million feet of lumber were destroyed at a lumber-yard in Cedar Springs.

Glens Falls, N. Y., was visited by a fire on Monday which destroyed the Opera house, Union Hall, Presbyterian Church, and fifteen stores; loss about $250,000.

Dr. Willard Parker, the eminent physician, died in this city on Friday at the age of eighty-four. For a period of thirty years, beginning in 1839, he was Professor of Surgery in the College of Physicians and Surgeons in this city. When he resigned this position he accepted the chair of Clinical Surgery in the same institution.

Brevet Major-General Opdycke died from an accidental pistol wound in this city on Friday, aged fifty-five. He was at Shiloh, Resaca, Chickamauga, Chattanooga, and Franklin, at which last battle, by a brilliant bayonet charge, he turned the fortunes of the day.

Ex-Gov. Marcus L. Ward, of New Jersey, died on Friday, aged seventy-two. He was a prominent and influential Republican.

FOREIGN.

Mr. Hugh C. Childers, Chancellor of the British Exchequer, introduced the Budget in the House of Commons on Thursday night. The revenue for 1883 amounted to £87,205,184, and the expenditure to £86,990,000. The income tax produced £453,000 beyond the estimate. The national debt up to the present time has been reduced by £72,680,000. It is now lower than since 1811, while the interest is lower than since 1805. The national debt was reduced during 1883 by eight and a half millions. The estimated expenditure for the current financial year is £85,292,000, against £85,954,000 during the previous year. Mr. Childers said it was difficult to forecast the revenue for 1884. Trade and agriculture were unsatisfactory, but the working classes were pretty comfortably off. The revenue was estimated at £85,550,000, against £71,866,000 last year. After eight months' experience the parcels post had produced only £155,000, against an estimate of £340,000. It was, therefore, proposed to de

fer the system of sixpenny telegrams until August, 1885. It is proposed to convert the 3 per cent. consols into 2¾ per cents.

In the House of Commons on Friday, the Government virtually accepted the decision of the House in regard to the Cattle Bill as expressed by the vote on April 22. They will propose an amendment, however, slightly modifying the bill by allowing the admission of cattle from one part of a country, although the foot and mouth disease is prevailing in another part.

Mr. Gladstone said in the House of Commons on Thursday that the Government fully recognized the obligation they were under for the safety of General Gordon, and would put themselves in a position to render all needful assistance. The final decision of the Government has been postponed until the arrival in London of Sir Evelyn Baring and General Graham.

England has proposed a conference of the Powers which signed the Berlin Treaty, concerning Egyptian financial affairs. Austria has accepted. The statement estimates that Egypt is now in need of a fresh loan of £8,000,000 in order to meet the most pressing requirements upon it, and points out the difficulty of devising a guarantee for such a loan inasmuch as all the resources of Egypt are already pledged. Italy has also agreed to a conference.

The inspired press of Paris insist that France will assert her rights in Egypt and reject the placing of the debt under British guarantee. The *Journal des Débats* again urges a direct understanding between France and England, and asks why the law of liquidation cannot be revised in the same manner that it was created. M. Waddington returned to England on Tuesday with Prime Minister Ferry's response to Earl Granville's Egyptian proposals. He generally approves the scheme of liquidation.

Earl Dufferin, British Ambassador to Turkey, informed the Government on Friday that the Porte insisted that if an Egyptian conference be held at all, its objects should include the settlement of the political as well as the financial question. Official advices from St. Petersburg and Paris showed that the Russian and French Governments were unwilling to discuss Earl Granville's proposals in view of the absence of any statement regarding the term of occupation and the policy of pacification.

Earl Dufferin has also stated that England maintains that Egypt is entitled to conclude commercial conventions with foreign Powers, granting the "most favored nation" treatment under the firman of 1876. The Porte has taken legal advice and decided not to protest against the treaties which Egypt recently concluded with England and Greece.

The British Government has refused to send an expedition to relieve Berber. This caused on Sunday great excitement in the political clubs of London. A non-party coalition is being formed for the purpose of attacking the Government's policy.

A council was held on Wednesday at the British Consulate, in Cairo, attended by Nubar Pasha, the Eyptian Premier, and Gen. Sir Evelyn Wood, the Commander-in-Chief of the Egyptian army. It was decided to advise the British Government to send a mixed expedition of British and Egyptian forces to the relief of Berber. That city was then invested by rebels who were also advancing from Korosko, and held the line of communication between Egypt and the Sudan.

The British agent at Berber telegraphed on Monday that the position of the town was desperate, that the troops were leaving and the rebels were entering houses in the outskirts. Every one was starting for Cairo. Despatches on Tuesday said that Hussein Pasha had proclaimed the evacuation of the town. The inhabitants had fled.

King John of Abyssinia has agreed to Admiral Hewitt's proposals to invade the Sudan and relieve the Egyptian garrisons. Osman Digna has sent a message to King John, through friendly sheikhs, in which he threatens to attack Abyssinia unless the Christians of that country become Mussulmans.

A native paper in Alexandria published on Friday a rumor that Khartum had fallen, that General Gordon was a prisoner, and that the natives were signing a petition for an English protectorate of ten years.

It was reported from Cairo on Saturday that Zebehr Pasha was intriguing, and that he was responsible for the recent uprising north of Khartum.

The Paris *Matin* published on Sunday a report of an interview in which it is alleged that "Number One" (Tynan) is somewhere in England. On Monday it was reported in Paris that an emissary of the Clan na Gael had arrived in that city from New York to buy a cruiser provided with torpedoes. Tynan is expected in Paris soon, where he and O'Cafferty will direct the dynamite and dagger campaign. An acting agent of the new party, which aims to unite all patriotic Irishmen, says that the party has already considerable funds with which to begin a campaign with cruisers provided with torpedoes. These vessels will be employed against British men-of-war in various harbors.

The officials of the Paddington Railway station in England have received threats that the station is to be blown up.

The Convocation of the University of Oxford has decided by a vote of 464 to 321 to admit women to a participation in the honor examinations.

London *Truth* says that Archbishop Gibbons, of Baltimore, will be the next American Cardinal.

Sir Michael Costa died of apoplexy at Brighton, England, on Tuesday night, aged seventy-four. He became distinguished early in life as a composer. In 1829 he went to England and entered upon a notable career. In 1846 he took the direction of the Philharmonic Orchestra and of the Italian Opera. He conducted the Birmingham Festival in 1849, the Bradford Festival in 1853, and the Leeds Festival in 1874. For over twenty years he conducted the Handel Festivals. He composed the operas "Malek Adhel" and "Don Carlos," and "Eli," an oratorio.

The wages of shipbuilders on the Clyde, Scotland, were reduced on Tuesday ten per cent. Twelve thousand men are idle.

The time having expired within which the Rajah of Tenom, in Sumatra, was ordered to release the crew of the wrecked British steamer *Nisero*, a British force will be sent against the Rajah to rescue the crew. The expedition is approved by the Government of the Netherlands.

The Anglo-French Commission to regulate the Newfoundland fisheries has terminated its labors in Paris. France renounces the right of fishing in certain bays of the island, but will exercise strict supervision over places where former treaties empower French subjects to fish. Newfoundland's sanction to the agreement is yet to be obtained.

M. Démosthène Ollivier, the French statesman, is dead at the age of eighty-five. In early life he engaged in commercial pursuits. He became known as a radical in politics, and opposed the restoration of the monarchy of July. After the revolution of February Ollivier was elected to the Constituant Assembly. At its opening session he demanded a unanimous declaration in favor of the Republic, and the whole Assembly enthusiastically approved. After the election of December 10 he constantly combated the Government of Louis Napoleon. He was expelled from France after the Coup d'État, and did not return until 1860.

Maria Taglioni, the famous dancer, died at Marseilles on Thursday. She was born of Italian parents at Stockholm in 1804. Her father was a ballet-master. She made her début in 1827 at the French Opera, and remained upon the stage till 1847, winning great applause in all the European capitals.

Prince Bismarck is preparing a radical revision of the Constitution of the German Empire. He proposes to amend the election law, making a new classification of electors, and to create a permanent military budget. Besides this he will impose upon the Deputies of the Reichstag an oath of fidelity to the Constitution, the object being to exclude Socialists from membership. If the Reichstag rejects these changes, the German princes will be convoked to frame a new constitution embodying Bismarck's ideas.

The Committee of the German Reichstag to which the bill prolonging the special Anti-Social Law was referred adopted on Tuesday, by a vote of 13 to 7, a motion of Dr. Windthorst to eliminate from the Anti-Social Law the clause which empowers the Government to prohibit Socialist meetings. Herr Von Puttkamer, Prussian Minister of the Interior, declared that unless the bill remained unamended it would surely be rejected.

Count Von Moltke is ill with catarrh of the lungs, and has retired on a long leave of absence to his estates in Silesia.

Two Anarchists at Berlin have confessed the details of a recent plot to blow up the statue of Germania at Niederwald with dynamite in a drain-pipe underneath it. Moisture alone prevented an explosion.

Elections for members of the new Spanish Cortes have begun. On Sunday forty-six districts returned 206 Ministerialists to the Chamber of Deputies.

In the Spanish elections the Conservatives used the whole force of the Government organization to secure the return of their candidates. The Liberals in many districts withdrew from the contest. On the meeting of the Cortes the Republicans will protest against this suppression of electoral rights. Of the twenty-four Deputies whom Cuba sends to the Cortes, eighteen are Liberal-Conservatives, three Autonomists, two Independents, and one Liberal.

A revolutionary movement appeared on Monday on the Spanish frontier, in the province of Navarre, where insurgents destroyed a customs office. Thirty armed refugees who were interned at Angoulême, in Southern France, entered Navarre under the leadership of a refugee named Mangado. At last accounts they were reported to be again retreating toward the French frontier with Spaniards pursuing them. Another band of insurgents appeared in Catalonia. Efforts are making to capture it.

More than forty lives were lost by a railway accident near Ciudad-Real, Spain, on Sunday. A passenger train went through a bridge, one of the supports of which had been cut, it is alleged, by Republicans.

A Madrid despatch on Tuesday said: "The American recognition of the flag of the African International Association, with the evident intention of ignoring Portuguese rights, has caused great irritation in Portugal. Such recognition looks like a piece of very sharp practice, novel in international relations, and hardly contemplated by international law."

The Moscow *Gazette* states that an important Mussulman agitation is in progress in the Caucasus. The Mollahs are preaching the assassination of Christians.

A great fire at Panama, on April 27 and 28, destroyed a large number of wooden buildings, nearly all containing stores of petroleum, gunpowder, etc. The loss was about $500,000.

MR. BLAINE'S RAILROAD TRANSACTIONS.

EVERYBODY who knows Mr. William Walter Phelps knows that he is a warm and devoted friend; indeed, he has "a talent for friendship." The fact that a politician is in "trouble" does not freeze the current of his sympathy. It is only a few weeks since he proposed to take even poor Keifer to his bosom. It is not surprising, therefore, that he should, though after three weeks' delay, have come to the rescue of Mr. Blaine, whose ardent supporter and admirer he has always been. But we think we can make it clear that he would have been a wiser and more judicious friend if he had let the matter alone. The natural thing, under the circumstances, for Mr. Phelps to do, was to print the documentary evidence on which Mr. Blaine's character had been assailed. We shall now, in spite of the heavy demands it makes on our space, do it for him, adding such comments as may be necessary. He will not find it pleasant reading, and much of it will apparently be new to him.

The story about Mr. Blaine's connection with the Little Rock and Fort Smith Railroad had been floating about a good deal in the spring of 1876. So he met it in the House in this fashion, April 25th of that year, admitting that he held bonds of the road :

"As to the question of the propriety involved in a member of Congress holding an investment of this kind, it must be remembered the lands were granted to the State of Arkansas and not to the railroad company, and that the Company derived its life, franchise, and value wholly from the State, and to the State the Company is amenable and answerable, *and not in any sense to Congress.* Since I purchased the bonds but one act of Congress has passed in any way touching the subject, and that was merely to rectify a previous mistake in legislation. . . .

"In the seven intervening years since Little Rock and Fort Smith bonds were placed on the market, I know few investments that have not been more affected by the legislation of Congress. But this case does not require to be shielded by any such comparisons or citations ; for I repeat that the *Little Rock Road derived all that it had from the State of Arkansas, and not from Congress.* It was in the discretion of Congress to give or withhold from the State, but it was solely within the discretion of the State to give or withhold from the Little Rock Railroad Company."

This statement was accepted by the public generally as a conclusive answer to the charge against Mr. Blaine. It continued to be so considered till June 7, 1876, when the investigation and the publication of his letters revealed the amazing fact that it was not true ; that the franchises and securities of the Little Rock and Fort Smith Railroad had no value unless the land grant to the State, which was in danger of lapsing, were renewed by act of Congress. Mr. Blaine not only knew this in 1876, but knew it in 1869. In that year, Mr. Warren Fisher took a contract to build the road, with the aid of the land grant, of course. That he was directly interested in getting the act passed which was to provide the money to pay the cost, is highly probable, though not proved. The date on which he made the offer to Mr. Blaine of a share in the enterprise does not appear in the evidence, but it must have been made very soon after the passage of the bill (April 9) and the making of the contract, as appears by the following letter :

"AUGUSTA, June 29, 1869.

"MY DEAR MR. FISHER: I thank you for the article from Mr. Lewis. It is good in itself, and will do good. He writes like a man of large intelligence and comprehension. Your offer to admit me to a participation in the new railroad enterprise is in every respect as generous as I could expect or desire. I thank you very sincerely for it, and in this connection I wish to make a suggestion of a somewhat selfish character. It is this: You spoke of Mr. Caldwell's offer to dispose of a share of his interest to me. If he really desires to do so, I wish he would make the proposition definite, so that I could know just what to depend on. Perhaps if he waits till the full development of the enterprise, he may grow reluctant to part with the share; and I do not by this mean any distrust of him. I do not feel that I shall prove a deadhead in the enterprise if I once embark in it. I see various channels in which I know I can be useful.

"Very hastily and sincerely your friend,

"JAMES G. BLAINE.

"Mr. Fisher, India Street, Boston."

He recurs to the subject a few days later :

"AUGUSTA, Me., July 2, 1869.

"MY DEAR MR. FISHER: You ask me if I am satisfied with the offer you made me of a share in your new railroad enterprise? Of course I am more than satisfied with the terms of the offer ; I think it a most liberal proposition. If I hesitate at all, it is from considerations in no way connected with the character of the offer. Your liberal mode of dealing with me in all our business transactions of the past eight years has not passed without my full appreciation. What I wrote you on the 29th was intended to bring Caldwell to a definite proposition. That was all. I go to Boston by the same train that carries this letter, and will call at your office to-morrow at 12 M. If you don't happen to be in, no matter ; don't put yourself to any trouble about it. Yours, J. G. B.

"Mr. Fisher, jr."

Fisher was then proposing to assign his contract to Caldwell, but did not actually do so till September following. Mr. Blaine waited all summer for a "definite proposition" from Caldwell, but none came. So he proceeded to refresh his memory and Fisher's, as follows:

"AUGUSTA, Me., Oct. 4, 1869.

"MY DEAR SIR: I spoke to you a short time ago about a point of interest to your railroad company that occurred at the last session of Congress. It was on the last night of the session, when the bill renewing the land grant to the State of Arkansas for the Little Rock Road was reached, by Julian of Indiana, Chairman of the Public Lands Committee, and by right entitled to the floor, attempting to put in the bill as an amendment to the Fremont El Paso scheme—a scheme probably well known to Mr. Caldwell. The House was thin, and the lobby in the Fremont interest had the thing all set up, and Julian's amendment was likely to prevail if brought to a vote. Root and the other members from Arkansas, who were doing their best for their own bill, to which there seemed to be no objection, were in despair, for it was well known that the Senate was hostile to the Fremont scheme, and if the Arkansas bill had gone back to the Senate with Julian's amendment, the whole thing would have gone on the table and slept the sleep of death. In this dilemma Root came to me to know what on earth he could do under the rules, for, he said, it was vital to his constituents that the bill should pass. I told him that Julian's amendment was entirely out of order, because not germane. But he had not sufficient confidence in his knowledge of the rules to make the point, but he said General Logan was opposed to the Fremont scheme and would probably make the point. I sent my page to General Logan with the suggestion, and he at once made the point. I could not do otherwise than sustain it, and so the bill was freed from the mischievous amendment moved by Julian, and at once passed without objection. At that time I had never seen Mr. Caldwell, but you can tell him that, without knowing it, I did him a great favor.

"Sincerely yours, JAMES G. BLAINE.

"W. Fisher, jr., esq., No. 24 India St., Boston."

It will be seen from this, that he had been already talking of this "point of interest" to Fisher, but was eager to bring it to Caldwell's notice. So he wrote again on the same day, this time speaking of the bill frankly as "your (Fisher's) bill." At this date, Mr. Phelps evasively says, "the transaction was nearly closed." It may have been, but Mr. Blaine's expectations were not closed:

"AUGUSTA, Me., Oct. 4, 1869.

"MY DEAR MR. FISHER: Find enclosed contracts of the parties named in my letter of yesterday. The remaining contracts will be completed as rapidly as circumstances will permit. I enclose you a part of the *Congressional Globe* of April 9, containing the point to which I referred at some length in my previous letter of to-day. *You will find it of interest to read it over and see what a narrow escape your bill made on that last night of the session.* Of course it was my plain duty to make the ruling when the point was once raised. If the Arkansas men had not, however, happened to come to me when at their wits' ends and in despair, the bill would undoubtedly have been lost, or at least postponed for a year. I thought the point would interest both you and Caldwell, though occurring before either of you engaged in the enterprise. I beg you to understand that I thoroughly appreciate the courtesy with which you have treated me in this railroad matter, but your conduct toward me in business matters has always been marked by unbounded liberality in past years, and of course I have naturally come to the conclusion to expect the same of you now. You urge me to make as much as I fairly can out of the arrangement into which we have entered. It is natural that I should do my utmost to this end. *I am bothered by only one thing, and that is definite and expressed arrangements with Mr. Caldwell. I am anxious to acquire the interest he has promised me. But I do not get a definite understanding with him as I have with you.* I shall be in Boston in a few days, and shall then have an opportunity to talk matters over fully with you. *I am disposed to think that whatever I do with Mr. Caldwell must really be done through you.* Kind regards to Mrs. Fisher.—Sincerely,

"J. G. BLAINE."

"W. F., jr., esq."

These two letters were undoubtedly due to his anxiety to have that ruling, which he had "the curiosity" to hunt up, weigh in the bargain he was expecting.

Was the interest he had already acquired such "as was sold on the Boston market to all applicants"? Nothing of the kind. In that case Fisher's offer would not have been as "generous" as Mr. Blaine "could expect or desire" (June 29). Nor would it have been a "most liberal proposition" with which he would have been "more than satisfied" (July 2). Nor would it have called forth from him the promise that he would "not be a deadhead in the enterprise" (June 29). If the purchase of the bonds "on the Boston market" had inspired these feelings in "all applicants," Mr. Fisher would have been smothered in gratitude.

Mr. Phelps seems to know little or nothing about this matter, apparently because he has not taken the trouble to read the evidence. Mr. Warren Fisher testified before the Committee that he never "sold to James G. Blaine any bonds of the Little Rock and Fort Smith Railroad"; that the bonds he gave Mr. Blaine were "for other parties" (p. 89, Evidence taken before the Judiciary Committee), and the sale of them was negotiated through Mr. Blaine. Subsequently Mulligan, his bookkeeper, produced Fisher's account with Mr. Blaine. The nature of Fisher's transactions with Blaine, who, owing to objections by members of the Committee, was described as "the third Party," or as "A," was such that "A sold to parties in Maine, on Fisher's account, $130,000 of common stock, $130,000 of preferred stock, and $130,000 of first-mortgage bonds, and the third party was to get $130,000 of land-grant bonds, and $32,500 of first-mortgage bonds for his share in the transaction." For all this Fisher received only $130,000 in cash. The memorandum book submitted by the witness showed in the margin the amounts payable as commission to Mr. Blaine by Mr. Fisher.

It appears, then, that Mr. Blaine did not tell the truth when he said that the Little Rock and Fort Smith Railroad Company owed nothing, "in any sense," to Congress and that he did not confine himself to the use of the word "company" (April 25, 1876). Mr. Phelps is now in our columns on this point guilty of something very like a quibble, and is himself the person who inaccurately reports Mr. Blaine's language. Mr. Blaine was not as sly as Mr. Phelps supposes. He said both "road" and "company," and meant road when he said company. Nor did Mr. Blaine tell the truth when he said "he bought the bonds at precisely the same rate as others paid"; nor does Mr. Phelps speak truly when he says that "there is no evidence which suggests" that Mr. Blaine was appointed an agent to sell the bonds of the company. Since Mr. Phelps is an honorable man, this simply shows that he has not read the evidence. He will find a flood of it on pp. 90, 94, 95, 103–4–5 of the "Evidence taken before the Judiciary Committee" of the House in May, 1876. Mr. Blaine was made such agent on "liberal" and even "generous" terms, and sold $130,000 of the bonds under the arrangement, and afterward took back a number of them—say seventy-five—from the persons to whom he sold them, and who could not or would not bear the loss caused by their depreciation.

What became of these bonds which he took back? We said in our article of April 10 that there was "strong but not conclusive evidence" that they were taken off his hands by the Union Pacific Railroad. Mr. Phelps, who seems to read very carelessly, describes this as a positive "charge," made "without a particle of proof." What he produces as disproof again shows that he has not read the evidence. The witness Atkins, a director of the Union Pacific, testified that the 75 Little Rock and Fort Smith bonds were bought by the Union Pacific Railroad Company for $64,000, when they were worth only $37,500 (p. 91). The witness Mulligan testified that Atkins told him his belief that the bonds came from Mr. Blaine to Mr. Thos. A. Scott, and that he got the Union Pacific to take them off his hands at the high rate (p. 95). Atkins denied this, but did not question Mulligan's veracity. He thought it must be a mistake. Mulligan also testified that he (Atkins) made the same statement to Mr. Blaine personally. The witness Fisher was under the impression that the seventy-five were Blaine bonds, and, in a correspondence with Blaine touching a settlement, thought he answered Blaine's complaint about his losses in the Little Rock and Fort Smith transactions by referring to this excellent sale to the Union Pacific, without eliciting any contradiction from Blaine (p. 119). The witness Harrison, a Government director of the Union Pacific, testified that on discovering the seventy-five bonds among the assets of the Company he moved an investigation, but was "taken aside" by Mr. Rollins, the Secretary and Auditor of the Company, and asked to withdraw his motion as it would injure Mr. Blaine; and that he subsequently found it impossible to have the matter inquired into (pp. 18–21). The witness Rollins could not remember who told him the bonds came from Mr. Blaine, and found his memory would not work on this point; but did not know why the Company should have bought the bonds of anybody (pp. 27–28). The witness Thomas A. Scott testified that he bought the bonds of Caldwell (Blaine's friend) at eighty cents on the dollar, and sold them to the Union Pacific Company at the same price he gave, eighteen months later, when they were worth only fifty or sixty cents on the dollar. The reason the Company made this very peculiar investment, by which it paid $22,750 more than the market value of the securities, was, he said, that it owed him a considerable amount for salaries and other services (pp. 47-50). From whom Caldwell obtained them, and on whose account he made this remarkable sale, did not appear, because Caldwell was in Europe in 1876. The inquiry was interrupted at this point, too, by Mr. Blaine's illness. But the evidence, we repeat, taken in connection with the relations of all the parties, strongly pointed to the sale of the bonds to Mr. Tom Scott, at nearly double the market rate, by Caldwell on Blaine's behalf, and a subsequent and more extraordinary sale of the same bonds to the Union Pacific Railroad Company, the whole being followed by a general hushing up of the matter, and a great failure of memory on the part of all concerned. Mr. Phelps's citation of Mr. Sidney Dillon, E. H. Rollins, and Morton, Bliss & Co. is simply worthless, though probably made without intent to deceive, because he has evidently not read the testimony. Morton, Bliss & Co. were no more likely to know anything about the transaction than the New York Postmaster who delivered their letters. The affectation of indignant surprise with which Mr. Phelps meets this would be most audacious if he were speaking in his own behalf, but is pardonable in an enthusiastic advocate.

Mr. Phelps's answer, in so far as it relates to the Northern Pacific transaction, calls for no fresh comment. He evidently knows nothing about it. We shall therefore simply reproduce Mr. Blaine's letter, and the passage relating to it in our article of April 10:

"AUGUSTA, Me., November 25, 1870.

"MY DEAR MR. FISHER: A year ago and more I spoke to you about purchasing an interest in the Northern Pacific Railroad for yourself and any you might choose to associate with yourself. *The matter passed by without my being able to control it, and nothing more was said about it. Since then the Jay Cooke contract has been perfected, the additional legislation has been obtained, and 230 miles of the road are well-nigh completed and the whole line will be pushed forward rapidly. By a strange revolution of circumstances I am again able to control an interest, and if you desire it you can have it.* The whole road is divided into twenty-four shares, of which Jay Cooke & Co. have twelve. The interest I speak of is one-half of one-twenty-fourth, or one-one-hundred-and-ninety-second of the entire franchise, being that proportion of the eighty-one millions of stock that are being divided as the road is built, and a like proportion of the Land Company stock that is formed to take and dispose of the 52,000,000 acres of land covered by their grant as amended by the law of last session. The amount of stock which this 1-192 would have in the end would be about $425,000, and the number of acres of land it represents is nearly 275,000. The road is being built on the 7.30 bonds, $25,000 to the mile, which Jay Cooke takes at 90. Instead of mortgaging the land they make a stock company for its ownership, dividing it *pro rata* among the holders of the franchise. The whole thing can be had for $25,000, which is less than one-third of what some other sales of small interests have gone at. I do not suppose you would care to invest the whole $25,000. I thought for a small flyer eight or ten of you in Boston might take it—$2,500 each. For $2,500 thus invested you would get ultimately $42,000 stock and the avails of some 27,000 acres of land. Five of you at $5,000 each would have a splendid thing of it.

"The chance is a very rare one. I can't touch it, but I obey my first and best impulse in offering it to you.

"All such chances as this since Jay Cooke got the road, have been accompanied with the obligation to take a large amount of the bonds at ninety, and hold them not less than three years. I will be in Boston Tuesday noon, and will call upon you. Of course if you don't want it, let it pass. You will receive an immediate issue of stock to a considerable amount, and certificates of land stock also. *Of course, in conferring with others, keep my name quiet, mentioning it to no one unless to Mr. Caldwell.* I write under the presumption that you have returned, but I have heard nothing. Yours truly,

"J. G. BLAINE."

This offer was accepted by Fisher, as appears from the following (p. 129):

"Received of Warren Fisher, jr., $25,000 in trust, in consideration of which I am to deliver to said Fisher properly authenticated certificates of an interest in the North Pacific Railway Company, equivalent to one-eighth part of one of the twenty-four principal shares in which the franchise-stock of said company are divided; certificates to be in the name of Elisha Atkins.

"Witness my hand.

"JAMES G. BLAINE."

On this peculiar transaction we remarked, on April 10:

"It appears from acts of Congress relating to the road, none of which are of older date than July 2, 1864, that the authorized stock was $100,000,000, with a land grant, estimated by the Commissioners of Public Lands at 47,000,000 acres, or 74,423 square miles. The line of the road was 2,000 miles long; and at

the time of Blaine's letter to Fisher, it was, he says, being built on bonds at $25,000 a mile, which would have made a bonded debt of $50,000,000. Mr. Blaine, as member of Congress and Speaker of the House, must be taken to have known about the circumstances of the road, and, therefore, there seems no escape from the conclusion that his offer was based on the expectation that he would receive almost as a gift a share in an enterprise dependent for its value on legislation in which he had taken part. Mr. Blaine's defence in the case of this transaction consisted at first of a denial that he had ever had any transaction with the road at all, but he afterwards rested on the fact that he had no pecuniary interest in the transfer, and that it was never actually made; yet, though this might be a defence to suit against him for a conspiracy to defraud purchasers of the stock, it does not affect in any way the nature of the offer. His relations with Warren Fisher were, in 1870, as appeared from the evidence, such that any favor done the latter, or gift presented to him, had a direct pecuniary value."

The letter shows, too, that he had actually been in pursuit of an interest in the road a year previously, had failed to acquire it, and that in the interval additional legislation for the benefit of the Company had taken place.

The charge of having obtained the letters from Mulligan by pledging his word of honor to return them, and then breaking his pledge, Mr. Phelps, we take it for granted, tacitly confesses on his friend's behalf; so that no more need be said about it, except that we are sure that there are enough voters who feel strongly about it to make it certain that no man who has figured in such a transaction shall ever sit in Washington's chair. On the other points discussed by Mr. Phelps he has nothing new to offer, except that he does not agree with the *Nation*. We may add that we believe Mr. Blaine's railroad transactions have no further interest for the public, and we do not mean to return to them. What gave us or anybody any interest in them was the chance of his being nominated for the Presidency—which has now, we believe, passed away.

MR. THEODORE ROOSEVELT'S CAREER.
